RAJAH

Shipments Are Delayed

Shipments of Rajah Plugs are considerably delayed owing to heavy government requirements placed with the Rajah factory.

In some sections of the country Rajah-Plugs are almost unobtainable. *Don't let this happen to you.*

We strongly urge you to place your orders now, anticipating your requirements as far ahead as possible to insure your having stock on hand.

Rajah Terminals and Adapters

are furnished so that Rajah Plugs can be used with any car.

Rajah Regular and Ferrule Clip Terminals

Adjustable to any cable and with ferrule to fit any cable. With the extra collar supplied both can be used with any make of plug.

Rajah Thumb Nut and Stud Terminals

The Thumb nut is an adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six and Pullman. The Stud for Buick, Chevrolet and Oldsmobile.

Rajah Ball Terminal

Adapter for Franklin, Locomobile and Willys-Knight.

Manufactured by

Rajah Auto-Supply Co.
Bloomfield, N. J.
Sales Department
Edward A. Cassidy Co.
280 Madison Ave., New York

Airplane ignition *must* be reliable

The pilot in the air demands constant, unfailing ignition and the maximum of power under unusual conditions. That is why he chooses Rajah Spark Plugs for his plane.

You can provide your customers with the same trustworthy ignition, for the same Rajah Plugs that are used by aviators, racing car drivers and hill climbers are available for all car owners. No *claim* of quality can weigh against *proof* of this kind.

Rajah Plugs achieved their reputation by delivering exceptional service under severe and unusual conditions. In offering them to your trade you are passing along this exceptional service. You can guarantee it and Rajah will back you up.

NOTE—Sell a complete set of Rajah Plugs to each customer. Then you will be giving them 100% efficiency in quick response, increased power and absolute dependability.

Dealers! Over 700,000 Car-Owners Are Waiting for This Accessory!

Needed on 104 Makes of Cars

Liberal Selling Terms

THE MASTERS GASOLINE METER

has been produced in response to a definite demand for an accurate gasoline consumption meter for motor cars. This meter can be installed in a few minutes on any car with a vacuum fuel feed. It keeps an accurate record to the tenth of each gallon used.

The hundreds of thousands of users of automobiles with Vacuum Feed Systems are positive prospects for the Masters Meter. Dealers will find it a profitable accessory.

In keeping a record of the gasoline consumption, this meter encourages the car owner to keep his car in trim. Insufficient lubrication, poor carburetion, bad valves, weak ignition and other motor car ailments invariably result in increased consumption. For this reason it is of extreme importance that an accurate record of the consumption be kept where it will come under the observation of the driver daily.

The consumption record shown by the Masters Meter on the cowl right before the driver's eyes cannot be overlooked. Today the car may be making 17 miles per gallon—tomorrow only ten. The Masters Meter forces the driver's attention to these differences, encouraging him to investigate the causes.

Dealers who are turning to accessories to hold up their profits, must realize that the time is ripe to market this Gasoline Consumption Meter. It makes a strong appeal to the hundreds of thousands of owners of such cars as the Franklin, Haynes, Peerless, Chandler, Dodge, Hudson, Mitchell, McFarlan, Buick, Chalmers, Chevrolet, Cole, Grant, Jackson, Nash, King, Kissel Kar, National, Oakland, Overland, Oldsmobile and 83 other makes. They have been waiting for just such a solution of their fuel record problem. They are reading the Masters Gasoline Meter advertisements in more than fifty different publications.

Get ready to answer your customers' inquiries and to fill their orders. Send for a sample today, with circulars, etc.

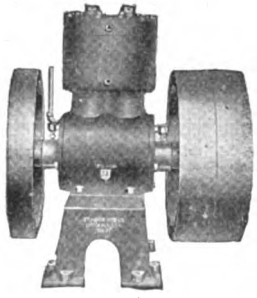
"The Garagemans O.K." is behind the Brunner Sign



The Brunner Sign has been consistently demonstrating its wonderful advertising value to the garagemen for many years. Thousands of garagemen who have been rendering Brunner Service, and have been advertising the fact by displaying the Brunner Sign, know that the Brunner Sign is recognized by the Brunnerwise Motorist as a sure sign of a compressed air service that always satisfies.

INSTALL A BRUNNER AIR COMPRESSOR

Just now in these war times labor is scarce and labor-saving equipment is playing a big part in the economical administration of every business. A Brunner Automatic Air Compressor would save you many hours time each week, because it is a high class thoroughly dependable equipment that delivers the goods—it requires no attention whatever aside from an occasional oiling, and automatically maintains an adequate supply of compressed air continuously—no waiting—no complicated attachments to help motor carry the load - no restriction of the lubrication.

You Cannot Go Wrong with a Brunner Air Compressor

because every one sold is backed up with the guarantee of the manufacturer as well as the Brunner Jobber that it will do the work for which it is recommended, and that it will be found exactly as represented.

"The Motorist who is Brunnerwise knows Brunner Service Satisfies"

"NORMA"

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

Service—that's what the buyer of a car or truck pays for. Its value to him lies in the measure of the service it renders. And this service must be a thing inherent throughout the machine—not merely in body, chassis or engine, but in every minute detail entering into their construction and equipment.

No part of the equipment is more vital than the magneto and lighting generator. And no part of these accessories is more vital than their bearings. Wherefore—makers of high-grade, responsible magnetos and lighting generators have standardized on "NORMA" Precision Bearings.

Automatic Feeding
For Large and Small Drills

NO guesswork in feeding your "YANKEE" Automatic-feed Bench Drill. The most inexperienced helper can be entrusted with this simple, yet highly scientific shop tool.

The "YANKEE" Ratchet Feed, thrown in at a finger-touch, exerts just the right pressure for the largest or the smallest drill. No attention required. Leaves the left hand free to hold the work. Enables going right through with the job—and without danger of smashing drill points. Automatic knock-off at extremes prevents jamming or breaking of gears.

And the Friction Feed! It adds speed by running drill to and from contact in extra-quick time.

No bench drill like the "YANKEE" for garage and general shop work!

"YANKEE" Bench Drill

No. 1005. Two speeds. 3-jaw chuck, holds drills up to ½ inch. Height 28 inches .... **Price** (Philadelphia) **$18.00**

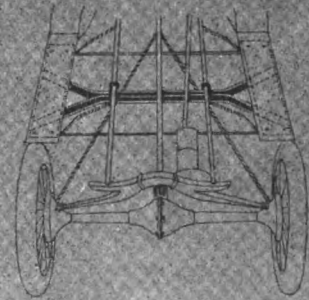
The New Presto Necessity

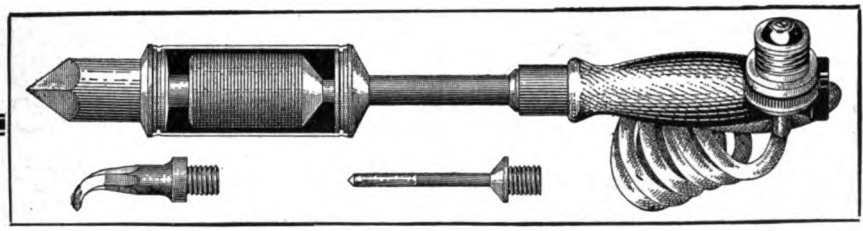
Presto Body Brace and Running Board Support for Fords



THE **Presto** Brace—strong as a bull because built scientifically like a trussed steel structure—read these ten important reasons why it is a real necessity for Ford Cars.

Stops vibration.
Avoids sagging of running boards and
Prevents their breaking away from fenders.
Prevents broken springs.
Prevents side swaying.
Prevents uneven strain.
Holds drive-shaft in position.
Holds all mechanical parts in alignment.
Equalizes spring action.
Easily installed; no holes to drill, no mechanic necessary.

Once used, it is practically indispensable because it enables you to carry 800 pounds on either running board if necessary without injury to your car. Dealers are amazed at the unprecedented success with which the Presto Brace is meeting.



Price only $3.50 in U. S. A., except west of the Rockies, $4.00. In Canada, $6.00. Satisfaction guaranteed. Order from your jobber, or write direct to us, if he cannot supply you.

DEALERS—Here's a new one that's getting over big. Write and ask us about it. **Satisfactory discounts.** Write for literature and cuts of all new products. Presto products mean bigger profits through increased sales.

Have You Had Trouble With Your Tires?

The fault is not with the tires. You, or your chauffeur, or both, are to blame. The responsibility is yours because you should keep the tires pumped up to a specified pressure, and don't.

Tires that are kept up to the proper air pressure last twice as long—sometimes ten times longer—than tires that are run with not enough air in them. Measure your air daily with a

SCHRADER UNIVERSAL TIRE PRESSURE GAUGE

and get out of your tires all the miles they can give.

Saves Time and Keeps the car Fine

That's the verdict of the man who uses NON-FLUID OIL on the gears and bearings of the car he is looking after.

TRADE MARK REGISTERED IN
NON-FLUID OIL
UNITED STATES PATENT OFFICE

saves time because it lasts longer than common grease. It is all lubricant and contains no non-lubricating substance like ordinary grease.

NON-FLUID OIL won't melt with heat nor harden when the car is not running.

NON-FLUID OIL just lubricates all the time, keeping the gears and bearings running smoothly and with the minimum wear and tear.

Try it yourself—most dealers keep it.

Get "KOO special" grade for gears, "KOOO" for bearings.

New York & New Jersey Lubricant Co.
165 Broadway New York

Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding qualities as well as economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

BLACK & DECKER

LECTROFLATER

ELECTRIC AIR COMPRESSORS

GIVE CLEAN PURE AIR QUICKLY!

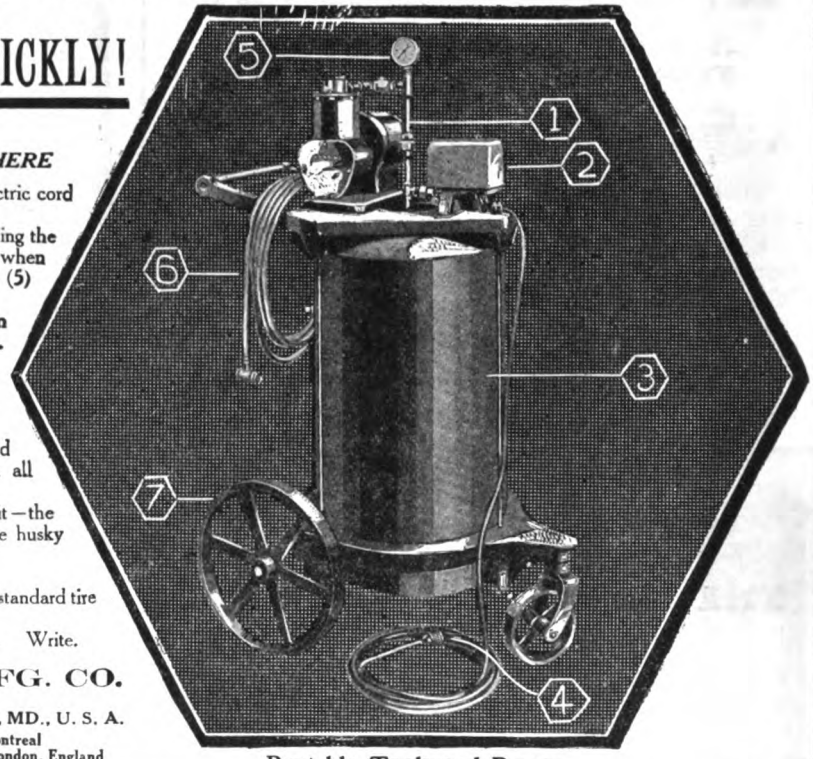
RAIN OR SHINE—IN THE GARAGE,
ON THE CURB—IN THE STREET—ANYWHERE

The Lectroflator can be filled by simply attaching the electric cord connection (4) to a convenient electric light socket.

Automatic Pressure Switch (2) starts the compressor refilling the tank when the pressure drops to 130 pounds and cuts out when 150 pounds pressure is reached. The large accurate gauge (5) indicates the tank pressure at all times.

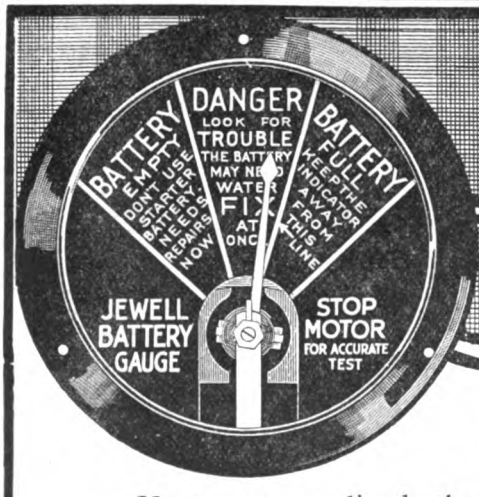
The Lectroflater is always ready with a load to fill ten average tires at a cost of 1/10 of a cent each in current.

The Pump itself is lubricated with grease—not oil (1) which means there's no oil level to maintain, and it's air cooled by forced draught so there's no liquid to freeze or evaporate.



All working parts housed and protected against dirt, grit, and rough handling. The tank (3) is welded and brazed in all seams and is tested to 300 pounds hydraulic pressure.

It's handsome—this Lectroflater Pump and Tank Outfit—the finish is green and black enamel with nickel trimmings. Large husky metal wheels (7) are furnished for hard service.



Twenty-five feet of high pressure hose (6) fitted with standard tire chuck—goes with each outfit.

Catalogue, electrotypes and mailing literature available. Write.

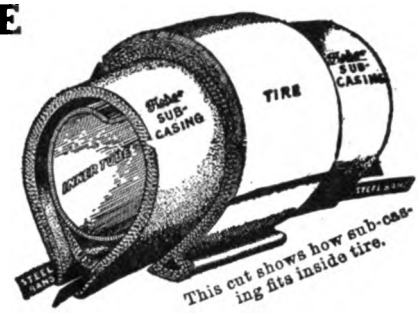
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE
LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.



A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

FISHER MANUFACTURING CO.

1706 PAYNE AVENUE, :: :: CLEVELAND, OHIO

This cut shows how sub-casing fits inside tire.

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles, treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

PECK'S SUPER HEAT MANIFOLDS

Are Doing Their Bit

Enable Your Car to Meet War Time Requirements of Economy and Fuel Conservation.

Some of the things that PECK'S Super Heat Manifolds are guaranteed to do:

Type for Fords $9.00

West of Rocky Mountains, $10.00

If your car is not equipped with a PECK'S Super Heat Manifold, order one today. It is guaranteed to give you from 40 to 60% more miles per gallon, with the same efficiency that could be obtained with high-test gasoline.

Cut fuel costs; increase mileage; eliminate carbon; give more flexibility, greater power; stop over-heat of motor; prevent fouled spark plugs; save trouble and satisfy owners.

With the increased cost of gasoline and with the poor quality, it is necessary to use some means that will vaporize the fuel, so the highest efficiency may be obtained. PECK'S Super Heat is the way.

If Your Dealer Can Not Furnish You, Write to Us Direct.

HURRICANE HOOK

Motor Car Door Ventilator

AN INGENIOUS DEVICE

which promotes the motorist's comfort in summer. Its simplicity, utility and practicality in permitting good ventilation are bound to create a demand.

The Hurricane Hook is a 5-16 in. rod about 6 in. long. One end fastens to the door, the other to the body. It holds the door open wide enough to let in the air, but not far enough to extend beyond the runningboard. It fits flush, there are no projections to catch clothing, and it will not rattle or chatter. When not in use it can be lifted off or left hanging down. It is mechanically correct, and adjustable to all makes of cars.

Prepare now for the big demand warm weather will create. Price only 60 cents, boxed individually. The discounts are very liberal. Immediate shipments. Write or wire today.

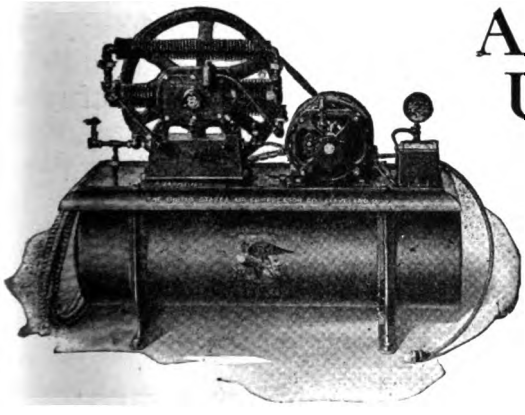
A Little Giant in the Garage

SAVES TIME—LABOR—EXPENSE

Make Your Own Threaded Parts!

Don't waste time in sending to the factory when a Little Giant Combination Screw Plate will put your cars back on the road in a fraction of the time otherwise required.

It is often possible to run over bruised threads without removing the part from the car. In close quarters, too cramped for the regular die stock, the Bit Brace Die Holder may be used—(the illustration shows a repairman cleaning up the thread on a spring shackle bolt).



Ask your dealer for No. 310 or 311 Little Giant Combination Screw Plate covering the sizes of U. S. S. and S. A. E. Standard threads commonly used in automobile construction—or write direct to Greenfield for catalog and discount.

Greenfield Tap & Die Corporation, Greenfield, Mass., U. S. A.

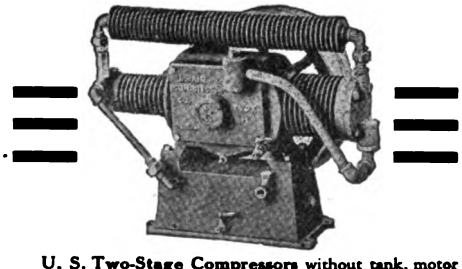
Canadian Plant: Wells Brothers Co. of Canada, Ltd., Galt, Ontario

Any One of the 20 U. S. Compressors A "Good Buy"

The United States Line comprises 20 different numbers in **Two-Stage** and **Single-Stage Types**, and various individual equipment adapted for forming combinations of almost unlimited kinds and capacities.



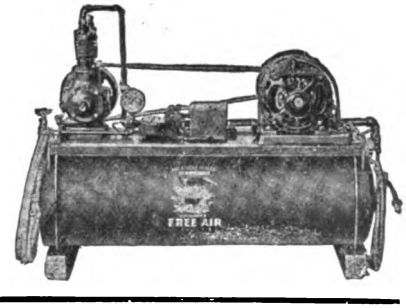
Each machine is designed to fill a particular need and it will perform that service in a manner that is never excelled and seldom equalled.

Our catalog giving complete information will be sent free upon request.

HERE is a machine that is wholly worthy of carrying the name United States, representing as it does the greatest possible attainments and incorporating all the highest refinements that mechanical ingenuity has been able to contrive.

The U. S. De Luxe Two-Stage Automatic Air Compressor is the kind of machine that is almost invariably bought when a desire to own the best and most efficient machine is the governing factor.

The De Luxe exactly meets the needs of a majority of garages. It maintains high pressure in great volume, is extremely quiet in operation, handsome in appearance, entirely automatic in operation and requires only a minimum of attention to keep in perfect running order.



U. S. Two-Stage Compressors without tank, motor or controlling equipment can be furnished if desired, having tight and loose pulleys as illustrated or large single wheel for direct motor drive. Capacities 4, 10 or 20 cubic feet per minute.

THE machine illustrated below occupies the same position in the *Single-Stage* field that has been obtained by our De Luxe unit in the *Two-Stage* field.

The U. S. Single-Stage Automatic Air Unit D-22 will be found highly satisfactory for garages and free air stations where the volume of business does not seem to justify the purchase of our De Luxe Unit.

This outfit is shipped completely assembled, piped and tested and will be ready to run when attached to lighting or power circuit, thus avoiding any expense for installation.

All U. S. motor driven units equipped with Patented Unloader which prevents burning out of motors, slipping of belts, etc.

The United States Air Compressor Co.

The old way

The new way

A man should not do the work a machine will do for him

A merchant, with all his troubles, should never do the work that a machine does better and quicker.

Our newest model National Cash Register makes the records which a merchant needs to control his business. It does fifteen necessary things in three seconds.

Without the register a man cannot do these things in half an hour.

With the register, even a new clerk can do them just by pressing the keys.

Our new electric machines are as much better than old machines as an up-to-date harvester is ahead of a sickle for cutting grain.

The latest model National Cash Register is a great help to merchants and clerks.

It pays for itself out of what it saves.

Merchants need National Cash Registers now more than ever before

FILL OUT THE COUPON AND MAIL TODAY

Dept. 703, The National Cash Register Company, Dayton, Ohio.

The Car Hospital and the Surgeon

The First of Three Articles, Dealing With Sick Cars Garage-Hospital Equipment and Ambulance Construction

I REALLY believe that Mr. Butterworth's old automobile has got dyspepsia, and I would be sure of it if dyspepsia was catching, for if I ever saw an automobile with stomach trouble, it surely is that machine."

I happened to overhear this statement made by a certain garage man not long ago, and it was his statement that brought to my mind the comparison between automobiles and human beings. An automobile surely acts human at times. It seems to have its own special likes and dislikes, its eccentricities, and is affected by the weather. Though it cannot choose its own master, it can protest, and often does, against hard work, by ceasing to work entirely. It acts similar to many people that we meet, by lying down on the job, or tries not to over-exert itself.

My First Automobile.

I once owned an automobile of the tin pan variety, which I will swear had a brain of its own. I could start the engine without the least bit of trouble at times, while someone else might figuratively "crank their heads off" without getting a single sputter from the engine. The engine seemed to know when I was in the machine and seemed to try its best to please; but if I left it in charge of someone else for half an hour, I always found it within a few feet of where I had left it, when I returned. The machine was absolutely thief-proof and though I disposed of it to an unsuspecting purchaser, the introduction never seemed to satisfy the automobile, though I am sure I did it properly.

The mechanical construction is very similar to the physical make-up of man. Its skeleton is its frame, its wheels are its feet, and its gears are its muscles. It may develop indigestion in its carburetor from trying to digest heavy gasoline; it may become frost-bitten and crack its water jacket; it may fracture its connecting rod or be overcome by the heat in the summer months.

Should anything go wrong with our internal machinery we are carried to the hospital. If trouble develops in the automobile, it takes a trip to the hospital as well, only in this case we term the hospital "the garage."

The repairman might be likened to a surgeon and in order to do good work the repairman must have proper tools just as the surgeon must have the best of instruments.

To a certain extent a mechanic may be said to be no better than his tools. He cannot do good work with poor tools, any more than the surgeon can perform a successful operation by the use of improper or inferior instruments. No matter how large or how small the garage may be, there are certain tools and equipment which are indispensable. Even the car owner himself in a good many instances practices automobile surgery and should have his own little hospital equipped with its operating table, which he calls his work bench, and other necessary tools for performing the various operations.

Proper Light Necessary.

Perhaps the most important thing to be considered in a car hospital is the lighting arrangement. No mechanic, however adept he may be in the art of performing an engine operation, can do satisfactory work unless he can see the parts upon which he is operating. A garage should have as many windows in the sides as possible. Even the doors should be fitted with large glass panels and if possible, a skylight should be fitted into the roof. In addition to this there should be a number of drop lights furnished, all distributed around the garage in such

Digitized by Google

a way that the mechanic need not spend time in finding an extension light and connecting it with a wall receptacle.

Some time ago I was in a garage where the repairman was working on his back underneath an automobile. If I remember rightly, he was scraping in connecting rod bearings and he would lift the drop light frequently to examine the bearings. About every five minutes he would crawl out from beneath the car and take up a broken portion of the wiring that was dragging on the floor.

Occasionally, he would burn out a fuse, all because the insulation on the wire had been destroyed by contact with metallic pieces and with oil, from dragging on the floor. I figure that the time the mechanic spent in repairing the lighting system was greater than the time consumed in making the engine repair. Quite frequently he would receive a severe shock from the light socket which was not conducive to steady nerves and good work.

A Handy Drop Light System.

At my suggestion a drop light was installed similar to those shown in Figure 1. The drop light A was connected through a flexible cord with the wall socket D and to A was attached a long heavy cord which was passed through two blocks, as shown at C and attached to a weight B. A knot was tied in the cord E to prevent the light A from being drawn out of reach by the weight. When the mechanic desired light on his work he simply pulled down one of the lights, and as soon as he was through with the light, he released it. The flexible cord was immediately drawn away from the floor and away from contact with oil and grease.

The lights might be arranged on the sides and across

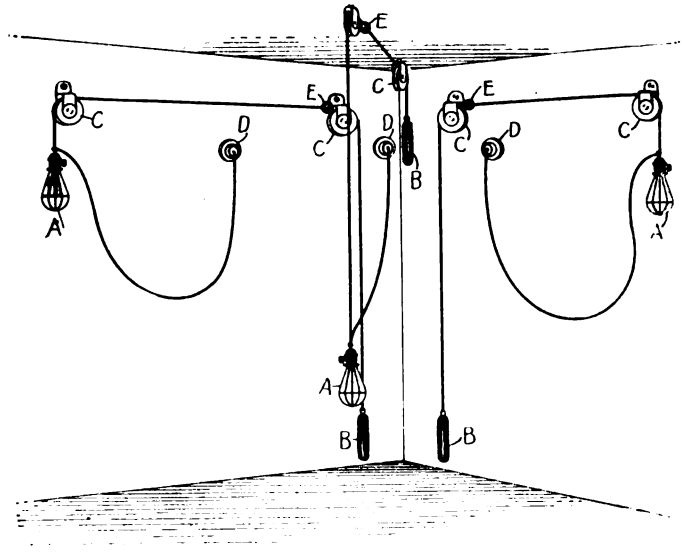

Fig. 1—Suggested Arrangement of Lights in the "Hospital".

the ceiling as shown in our first figure. In all cases, however, the weights must be carried to the side of the room or preferably to a corner where they may be enclosed in a box.

Few garages are built with pits in the floor. In many cases the city or state fire laws prevent such an arrangement, and there are few repairmen that care to do work while in the pit. The mechanic may crawl beneath the car and lie in the oil and grease upon the floor. If, however, he is enterprising he will not care to do this,

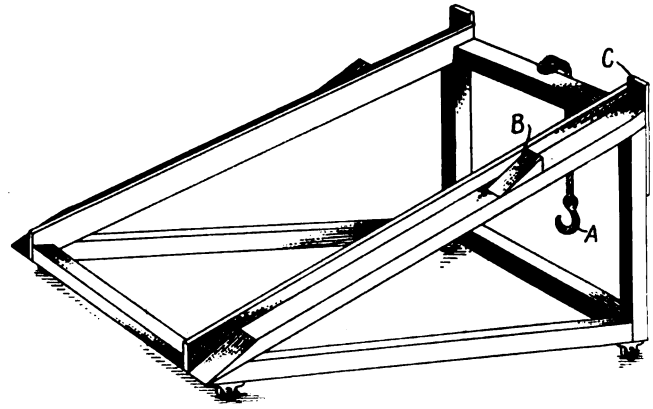

Fig. 2—How the Portable "Pit" May Be Constructed.

for he realizes that he cannot do good work lying on his back with his eyes only a few inches away from the work.

A Portable Pit.

There are two ways to overcome this trouble, and in Figure 2, a suggestion is given which should prove interesting both to the large garage owner as well as to the private car owner. This device can be made of odd pieces of lumber, preferably heavy joists, which may be obtained at almost any lumber yard. The illustration shows just how the device should be built. The inclined runways should each have an adjustable wedge, B, bolted into place and so arranged that it may be placed at a number of different points. The sides of the runways should be protected with boards to obviate any danger of the car wheels running over the sides. Stops should be provided at C to prevent the car from running over the end.

If work is to be done upon the front end of the car the device is pushed against a wall and the car run up the plane and fastened into place with the iron hook A. As an added protection, the blocks B are put into place to prevent the car from rolling backward. The car with the device in place may be wheeled to any position in the garage, for the runway is provided with casters upon the bottom. The mechanic can crawl beneath the car much more easily with it up in the air and do his work much better than if the car rested upon its own wheels.

An Automobile Cradle.

Another form of hoist which should be built for every large garage is shown in Figure 3. Four by four joists should be used throughout, and these joists should be reinforced at the corners by means of angle irons. Across the center at C a joist should be arranged and fitted with numerous large eyebolts.

Digitized by Google

Two sets of block and tackles are used for lifting the whole car from the floor and a heavy clamp should be provided at B around which to wind the end of the rope from the tackle. A car may be suspended in this cradle-like arrangement and an additional tackle hung upon the joist C for lifting out the engine or removing the transmission. As in the device shown in Figure 2, casters are provided so that the whole arrangement may be moved to any part of the garage even after the car wheels have been taken from their places.

An Engine Operating Table.

In Figure 4 is shown what might be termed an "operating table," and though there are many of these devices now on the market, the garage man can construct one for himself very easily from pipe fittings, angle iron and cold-rolled steel shafts.

Two large A frames are made from angle iron and reinforced across the bottom with a strip of flat iron. Upon the upper parts of these A frames are two large plates with holes cut through them large enough to carry

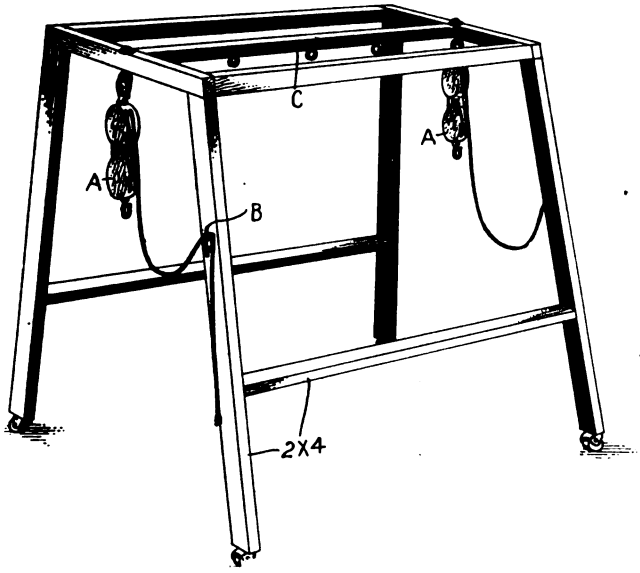

Fig. 3—An Automobile Cradle, Which Should Be Found in Every Garage.

two inch hydraulic piping. Around these holes should be punched a number of smaller holes to accommodate bolts. Upon one end of a short piece of hydraulic piping is welded or pinned a floor plate D, and this floor plate is bolted to a piece of channel or angle iron as shown at C.

The hydraulic piping should be threaded its full length and provided with two more floor plates. The purpose of these floor plates is to clamp the piping in place upon the A frames, and if the holes in the A frame are properly bored, the frame shown at C may be tipped at practically any angle.

Two more pieces of flat iron are provided as shown at E and both C and E are punched with holes evenly spaced their entire length. Upon this frame an engine may be placed bolted to the cross pieces E and tipped at any angle for repairs. At a slight additional expense casters may be mounted upon the legs and the motor operating table may be wheeled into the machine shop or to the work bench. I want to lay special stress upon this piece of equipment for a garage, as I feel that it saves considerable time.

Device Saves Much Time.

I visited a supposedly up-to-date repair shop in New England where the owner did not care to invest in a motor operating table such as I have mentioned. I watched one of the mechanics remove an engine from the car, and this is about what happened:

The mechanic loosened all of the bolts in the engine and called two other mechanics from their work-bench to help him. The three men, after much talking and arguing, lifted the engine from its place and carried it to the work-bench where the first mechanic did a little work upon it. He then decided that the whole machine would have to go to the machine shop for repairs, and so he called the two mechanics to help him again. After considerable more trouble they managed to get the engine into the machine shop where two of them remained to hold it beneath an upright drill. The third did the work.

For this one repair, three mechanics were kept busy approximately half an hour each. I didn't stay to watch them put the machine back into the automobile again, but I should judge another half hour might have been consumed in this performance. Three hours of wasted effort per day in overhauling one engine might have been the item charged against this particular repair. It would have been a needless expense had the garage been provided with the device which we have mentioned above.

What a needless waste of time there is in locating small tools! A mechanic crawls beneath a car and discovers that he lacks a hammer. Out he crawls again, goes to the work-bench, hunts around and finds that implement, then crawls beneath the car again.

If he does not find the hammer upon the work-bench,

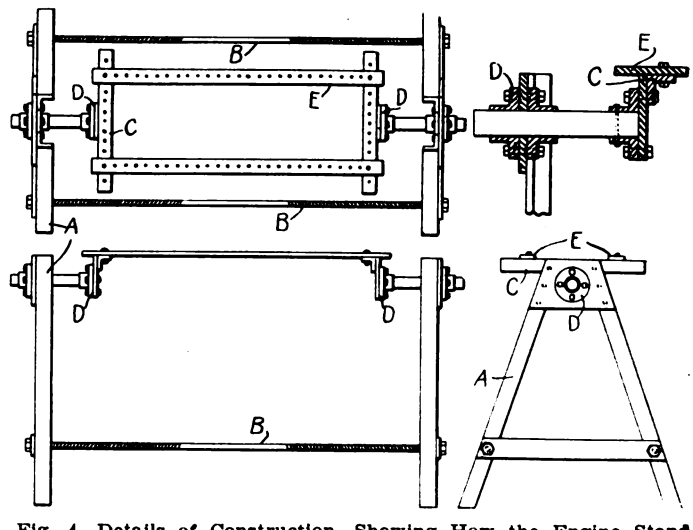

Fig. 4—Details of Construction, Showing How the Engine Stand Is Made.

Digitized by Google

it is very possible that he borrows the tool from the mechanic working under the car next to him. In a few minutes that mechanic misses the hammer and he goes through the same performance, and so it goes. Every day each wastes a dollar's worth of time hunting around for a forty-five cent hammer.

Again, small tools have the extremely bad habit of disappearing. They seem to be equipped with the necessary limbs for their own locomotion, so quickly do they get out of reach. If they are thrown indiscriminately into a general box of tools, their absence is never noticed until they are wanted.

If one arranges repair tools in a box as shown in Figure 5 he will have no trouble in locating them, for the very reason that there is a place for each particular tool, and its absence may be noted as soon as a particular job is completed. The boxes may be made in varying depths, and each one should be made to fit a particular set of tools. One box may hold hammers, chisels, pipe wrenches, pliers, etc., and marked on the outside "general tools."

Another may be fitted to contain tire and valve grinding tools, another woodworking tools, and still another Ford and other special wrenches. After the tools have been selected for a particular box, the box should be made to fit them. Each tool should be put in place and staples driven upon each side of it. Through these staples a length of heavy cord should be passed and the cord fastened to an ordinary flagpole rope fastener. If the tools are longer, two or more ropes may be used

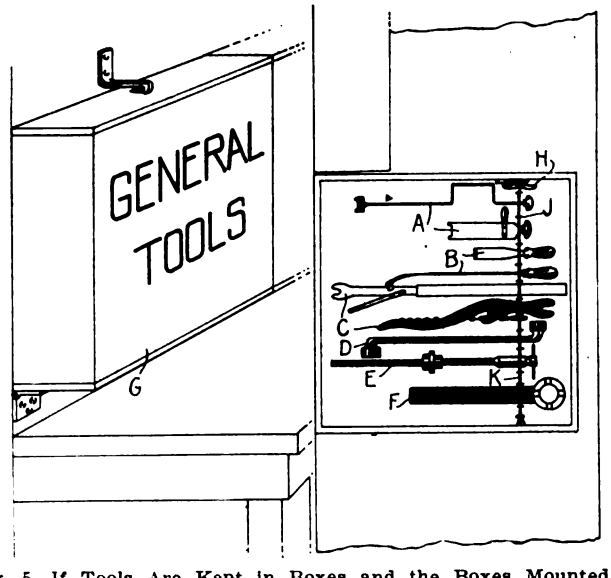

Fig. 5—If Tools Are Kept in Boxes and the Boxes Mounted as Shown, Much Time May Be Saved.

to hold them in place. The above box shown in Figure 5 contains valve tools and special valve wrenches.

In mounting these boxes on the wall above the bench be sure to have the hinges high enough from the bench so that the box can be opened flat upon the top of the table.

Wall space in a garage should be utilized as much as possible. Many of the heavier tools may be mounted upon the walls rather than thrown beneath the benches.

A Washing Tank.

In Figure 6 is shown the unique washing vat combination. The vat is made in two sections of heavy gal-

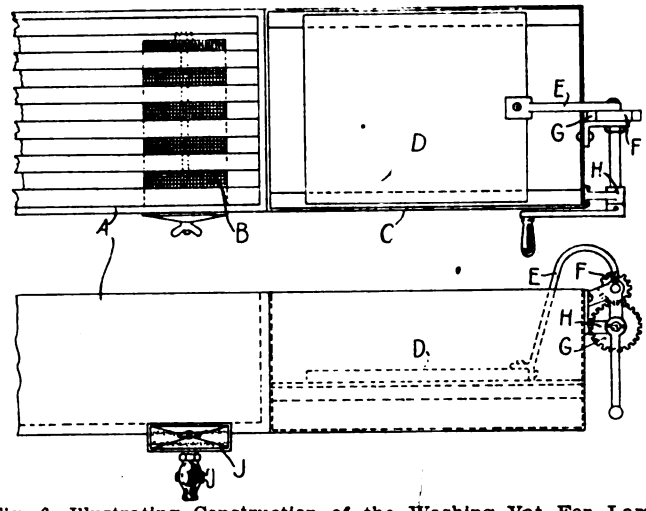

Fig. 6—Illustrating Construction of the Washing Vat For Large and Small Parts.

vanized iron and lined throughout with wood of at least half an inch in thickness. For the heavier pieces, the vat shown upon the left is used. Across the bottom of this vat extending lengthwise are a number of slats, and near the partition, the bottom is cut and a large box-like arrangement soldered beneath it. The front of this box-like arrangement is fitted with a cover held in place by a long bolt, as shown by the dotted lines, and a wing nut. Inside the box is placed a square screen of fairly fine mesh. The purpose of this screen is to prevent dirt from clogging the drain cock at the bottom.

The compartment shown at the right is fitted with two wooden runners in each side upon which is rested a flat wooden tray. This flat wooden tray slides back and forth upon the runners a distance of approximately two inches. To the tray is fastened an arm E, and this arm fits upon a small gear, F. The gear F is driven by a larger gear, G, and supported by suitable bearings at H. The larger gear is driven by a hand crank. As the crank is rotated, the tray D is shaken back and forth in the oil thus freeing small nuts, bolts, screws, cotter pins or other parts, from grease and dirt.

After the oil has absorbed much dirt and grease, the drain is opened and it is drawn off through the strainer B. The strainer B may then be removed, the dirt dumped out, and the strainer replaced again, putting the cover J back into place and tightened up with the wing nut.

Strong washing soda, potash lye, or kerosene oil may be used in this vat, though kerosene is to be recommended. The whole device may be mounted in one corner of the shop out of the way, or even beneath one of the large machine tools.

I have spoken above about the various trips which a mechanic would be obliged to make from car to the

Digitized by Google

work-bench for tools. Where the work to be done is extensive, such as the tightening of connecting rods or similar work, the mechanic would be obliged to make at least two trips to the bench for necessary tools, thus wasting considerable time. Each mechanic working in the shop should be provided with two heavy boxes measuring two feet in width, three feet in length, and one foot in depth and mounted upon casters.

In these boxes are placed all of the tools required for the particular job upon which he is working, the necessary new parts and other articles required. He can then wheel the box to the machine and remove the tools, putting them beneath the machine or upon the running boards, as convenient.

Each particular box should be numbered, and if any parts are removed from the engine or the automobile, these parts should be placed in the boxes; never upon the floor. In this way there is no danger of losing anything or mixing the jobs.

As an additional equipment for the mechanic, a board of the same dimensions as the box, measuring one inch in thickness, should be mounted upon wheels. This board may be used for wheeling heavy castings or even units from the automobile to the work-bench or to the machine shop.

Of course not all of the devices and features mentioned can be used in every garage. For instance, the automobile hoist shown in Figure 3 may be too large to be used in a small garage, but the idea itself can be applied to any garage no matter how small. Even an individual car owner can work out a scheme similar to this by fitting the roof of his garage with proper cross boards.

Every car owner should have at his disposal some means for lifting his car from the ground. Even if he does not do his own work he may want a mechanic to come in and do the work for him. His garage should be fitted with a joist running lengthwise sufficiently heavy to support the weight of the car. If the garage is too long to attempt this, he may have two or more joists running crosswise at intervals of about four feet.

Many Practical Suggestions Gleaned From Louisiana Garages

The Garagemen of the South Do Not Believe in Putting All of Their Money in Tools, They Usually Make Devices for Special Work.

BY JAMES F. HOBART, M. E.

THE writer happened into a shop recently, just as a mechanic was planing the ends of three new wooden ribs to be placed in the top of an automobile which had been wrecked while the machine was being towed to the garage. The machine had swerved out of the road just as the transmission went bad and the driver phoned for a car to haul him back to town for repairs. But when the car reached the garage, it needed far more repairing than when it was hauled out of the ditch into the road.

The person who went to tow back the disabled car was a young man with but a few months' experience in automobile repairs, but he was a capable man, and if let alone would have taken in the disabled car in a proper manner. But the driver of the disabled car was one of those important persons who feel that their opinions are everything and those of other people nothing!

Towing the Car Backward.

This man insisted that the mechanic hitch the tow-line to the back of the car and thus pull the car back into the road. This was all right and a proper way, and it was done successfully. Then the driver ordered the mechanic to pull the car back to the garage, rear-end first and the mechanic objected but was ordered by the driver of the car to proceed in that manner so he had no choice but to do so.

For a time things went well. The driver went quite slowly but was soon ordered by the man at the wheel to "hit her up" and was forced to increase the speed. Shortly afterwards the man at the wheel became confused and turned the wheel the wrong way, while passing a curve, and "bing," the car came to a mighty sudden stop, having struck squarely against a telephone pole, throwing the steersman entirely over the back of the seat he had been sitting on and mussing things up generally!

The back of the car was broken right in two, clear to the front of the rear seat and three of the ribs broken in the top of the car. Just from "plumb foolishness!"

Repairing An Auto Rear-End.

The broken rear end was repaired by stripping off all the upholstering and pressing the broken and cracked parts into place again as well as possible after which a strip of bar steel about three inches wide was worked out, bent to fit the curve of the back and arms or projections welded on to reach down along the panels of the back frame. The steel skeleton was then drilled, countersunk and fastened inside of the back by a number of flat head wood screws.

Digitized by Google

The steel reinforcing was covered by the upholstering and, save for a very few and very small irregular or depressed places in the back, no one would ever know from the appearance of the car that the back of the seat had been smashed into kindling-wood. A bit of "touching-up" of the paint on the back of the car made it as good as new and saved the owner the expense of building an entirely new back to the car.

Fitting Top-Ribs.

Broken ends remained in some of the metal sockets and it was found necessary to burn them out. It was found that this operation might be done easily and quickly by grasping a socket with a pair of bolt tongs, heating the socket until the wood smoked, then by striking the socket smartly across the corner of an anvil that the wooden end of the rim would be thrown out usually at the second or third blow.

In fitting the new rib to a socket, it surely pays to make a pattern to fit the inside of the socket. This is done easily by using a bit of veneer for the pattern. The thin veneer, an eighth of an inch or less in thickness, may

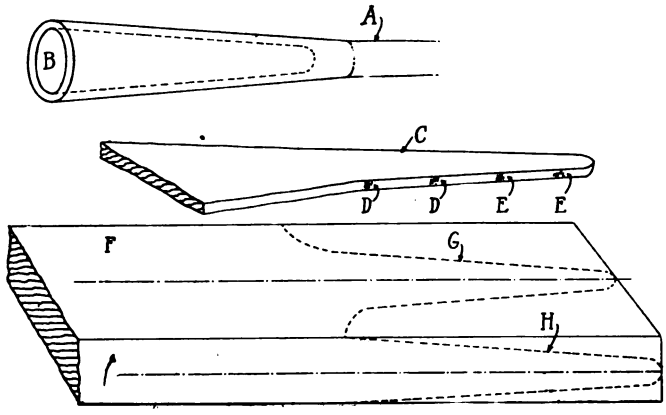

Fig. 1—Showing How the Veneer Pattern For Repairing Bows, Was Fitted.

be whittled to approximate size, twisted around inside of a socket and quickly fitted by shaving off the parts of the wood which have been marked by twisting against the metal of the socket.

Fig. 1 shows the situation. The socket A, having been cleaned out as described, a bit of veneer C, was cut to slide into the hole B, in the socket and was twisted around a few times leaving markings on the edges as shown at D D E E. These markings were carefully removed by planing, filing or with a spoke-shave, then the pattern tried into hole B, again more markings were made and the piece cut to shape. This process was repeated until pattern C fitted inside of the socket as well as was necessary.

The pattern C was then placed with the center line upon rib F, and a mark made around the pattern as shown at G. The marking operation was repeated on the edge of the top-rib at H, after which the rib was sawed to both dotted lines and it was but the work of a very few minutes to round up the end of the rib and to make it a good fit inside of socket A. By the marking and sawing-out method, the end of the rib was brought to the proper shape at once and the tenon thus made was always central with the length of the rib.

Revised Traffic Signal Rules.

Owing to the large and increasing number of accidents in New Orleans, due it is claimed to confusion of signals because of the many methods employed for signaling to cars approaching from the rear, a revised code of "wig-wag" signals has been prepared and was put in force a short time ago. Briefly stated, the revised signals are as follows:

> The left arm extended horizontally and held stationary means that you are preparing to turn to the left. Moved up and down, that you are preparing to stop. Rotated slowly clock-wise, that you are preparing to turn to the right. This applies to all vehicles with left-hand drive.
>
> In vehicles with right-hand drive, signals should of course be given with the right arm and the turning signals should have the reverse meaning.
>
> These signals must be given only by the person who is driving the car.

In the Crescent City, on St. Charles street, also on Canal street, mornings especially, car drivers occasionally stop near to the neutral ground to pick up friends who may be standing on neutral ground at the crossing waiting for street cars. This is a dangerous practice and has resulted in several accidents, particularly when the streets are slippery; the practice has been forbidden in the following law:

> No car shall ever stop with its left side near to the curb of the neutral ground, but should pull over to the right before coming to a stop thereby avoiding not only a dangerous practice but a violation of the law which the public safety requires shall be rigorously enforced in the future, beginning forthwith.

A remarkable accident which recently took place on the principal street of New Orleans, shows the necessity for care in parking cars, particularly on side streets close to street-car track intersections with the main street. A trolley car recently jumped the track upon a curve, and before the car could be stopped it ran across the inward tracks on the curve and crashed into an automobile that was parked there.

The "wild" car struck the automobile a "quartering" blow, drove that car back against the one behind it, and that car was forced against another and so on down the line until five cars had been damaged to an aggregate extent of nearly $1,000, police estimate. The strange thing regarding this accident was that the trollev car was not damaged in the least, or even scratched, while the fenders, mud-guards, head and tail lamps and other external parts of five cars were "made into a regular omelette," as one of the large number of bystanders who witnessed the accident expressed himself regarding it.

The lesson is obvious—don't park too close to a curve in the street railway track, across which curve a street car may shoot in case of a derailment.

Digitized by Google

An unusual application of a Republic Motor Truck was recently seen by the writer when visiting the round-house of a small steam railroad near New Orleans. This road, The New Orleans and Gulf Coast Railroad, has sixty miles of track which extends through some of the richest "truck farming" lands in the United States. Every short distance along the road a farmer has a platform where he places the "garden-sass" in readiness to be picked by the freight trains which work along the road.

It was quite a slow task for the freight to stop at every little platform along the road and it was absolutely impossible to make any speed, so the railway management procured a large Republic truck and built thereon a slat body—the sides and top were of slats about 4 inches wide and one inch thick.

The body was as wide as a freight car and was fitted with a sliding door which locked the same as a regular freight car door. The slat body was about sixteen feet long and nearly balanced over the rear axle. This modified motor truck was fitted with regular railroad car wheels, rims in place of rubber tires and the front axle had been clamped rigidly to a bar of steel, forged to fit that axle.

This truck was run over the road, ahead of the regular freight train and picked up and receipted for the produce which the farmers had placed upon their platforms. At intervals of about five miles the motor truck deposited the loads it had picked up and at these places the produce was transferred to the regular train, which was thus enabled to make far better time to the city than when it made from two to ten stops per mile.

Pipe Wrench Repairs!

A car was recently towed to a repair shop with one "corner" resting on a piece of scantling and one wheel inside of the car. Some genius (?) had attempted to remove the ball bearing from one of the wheel hubs and, not having the proper wrench for that work, had evidently pulled upon the nut with a big pair of pipe tongs. The screwed bushing-nut didn't come out under that treatment, but the flange which served as a nut did come

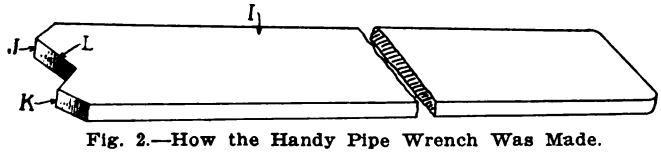

Fig. 2.—How the Handy Pipe Wrench Was Made.

off—in pieces—and it broke well down, inside of the hub.

The "Wrench Man" abandoned the job at this stage of the game and brought the car to the shop as above described and the broken nut-bushing was finally removed by a mechanic after a good deal of trouble and the forging of a special tool for the work. Fig. 2 shows the tool which was made from a worn-out 12-inch file from which the temper had been removed. The piece of file-steel is shown at I, and at J is shown a sharp point made at an angle of about 90 degrees.

At K, another and similar point is shown, and when the tool is to be used, point J is placed against some projecting broken corner of the nut and hammer blows are delivered upon the other end of tool I in hope of starting the sleeve-nut from its seat. It was found difficult in many cases to make joint J "bite" the broken nut,

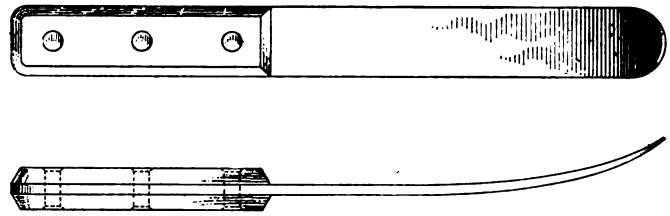

Fig. 3—The Tire Iron, Made From a Broken Spring Leaf.

trouble being met with by the tool jumping or slipping off under the stress of the hammer blow.

To remedy this trouble the second point K, was made. When using this point the tool may be so placed that the flat place L will bear against the broken surface, upon one of its points, while point K engages the point a short distance below, and thus enables the workman to hold the tool firmly in place while the blows are being struck, avoiding the danger of the point slipping off of the projection of the broken nut against which it may have found a lodging place. With this tool the broken nut was quickly "backed" out of the hub.

Locking An Automobile.

The writer has noticed many cars recently which the owners had left parked along the curb with evidently a good deal of confidence that the car would be awaiting the owner when he came out of the theater after the show. The very business-like manner in which these cars were secured was to procure a piece of stout log-chain about four feet long and made of 7/16 inch or ½ inch steel rod.

The chain would be threaded through a front wheel, passed between two of the spokes, then around the rim and then through the end of one of the forward springs. Some of the owners used a chain so short that it was necessary to turn the rim of the front wheel toward the spring before the ends of the chain could be brought together.

The ends of the chain were united by a padlock. One made of brass is preferable because it does not rust when exposed to severe weather conditions. A very large padlock was used, one with as large a bail or hook as could be made to pass through the chain-links. Such a large lock was preferred to provide the strength necessary to prevent the lock from being broken by a smart blow from a hammer or a wrench. A small lock would be broken easily in that manner

The chain was made as short as possible, even to the pulling of the wheel around, and then barely long enough to allow the lock to connect the ends of the chain. It was made short in order to preclude the possibility of thrusting a piece of steel rod or pipe through the lock

Digitized by Google

and then twisting up the slack of the chain until further twisting tore the bail or hook bodily from the lock, leaving the car at the mercy of the thieves.

With no slack in the chain there was danger of breaking a wheel, a knuckle or the spring before the lock would be torn apart, hence the use of a very stout lock, a very stout chain, the links of which would take up as much room as possible under the bail of the lock, thereby making it almost impossible to break off the bail without doing so much of a hammer job that the attention of the police would be drawn to the operation.

A very handy tire removing tool was recently seen "at work" in a garage, and a right handy tool it proved, too. It was, as shown by Fig. 3, simply a piece of broken spring-leaf. Instead of using the piece just as it was broken off, or by forming a handle by the winding on of half a dollar's worth of electrical friction tape around the broken end, this garage man had planed out two bits of wood, placed one on either side of the spring, drilled right through wood and steel, put in three flush rivets, and the tool was complete, perhaps with a little rounding of the corners on the grinding wheel.

The Construction and Repair of Radiators

Part 1.—How This Important Part of the Cooling System Is Made and How the Honeycomb Type of Radiator is Repaired

BY M. J. HENNESSY, M. E.

A WELL-KNOWN manufacturer has a slogan which runs: "An engine is no better than its cooling system and a cooling system is no better than its radiator." I think we may take the privilege of changing this statement to read that an automobile is in no better condition than its radiator. We are united in the understanding, of course, that an automobile engine must have a very high temperature to work efficiently. A good radiator keeps the engine at the right temperature. It is no uncommon thing, however, for an engine to overheat in spite of the radiator. So, you see, we must be careful to avoid pinning the sins of our engine on our radiator.

The first radiator used on automobiles consisted of a series of coiled pipe; very much similar to the steam coils to be seen on the walls of nearly every garage or factory. These coils were placed on each side of the hood, or bonnet. The next step in the evolution of the radiator was to put fins on the coiled pipes. About this time a few of the more radical makers moved the two heaps of coiled pipe from the sides of the engine, placing them in one pile in front of the engine. Then, also, the Renault Bros. brought out a radiator which was practically the same as the present-day radiator. They, however, placed the radiator behind instead of in front of the engine. This radiator consisted of a core of vertical tubes set into two header plates. These header plates, in turn, formed integral parts of a tank, the whole business then being soldered together. Thus, you see, with the exception of different styles of cores and with the further exception of what is known as the cellular type, radiators are practically the same in general as they have been for many years.

The honeycomb section type of radiator is, without doubt, the most widely known and the least understood. From the front view, this type seems to be a square grid. Around each of the squares is a water passage. The section, as it is called, is made up to order, and can be bought by the repair man from any of the firms who manufacture radiators.

The method of building a radiator, while it varies in detail with the factory in which it is made, is near enough to being universal, to merit some description. The shape and size are, of course, specified by the car builder. The frame or outside case determines the finished shape. The base is usually a fairly heavy plate, from a quarter to three-eighths of an inch thick. Very often the thickness of this plate depends on how the radiator is to be anchored. In some cases it is made in the form of a "U," the sides of the "U" coming up to about one-third the height of the radiator. On this base a frame of sheet metal is made, either of brass or sheet iron, coated to prevent rust.

The edges of the frame are turned in such a way as to be used for a seam later on. The core is, as a rule, made in rectangular form. The strips or layers of section are coated on the faces which are to be joined together with a flux of some sort. The layers are set one on top of the other and in such a way that the water and air passages will line up. They are then clamped together and immersed in a bath of solder. Following this, the core is next placed in the frame, centered, and then fastened into place by means of face plates on the back and front of the radiator. These plates not only hold the core in position, but also form the sides of the tank.

First Locate the Leak.

In repairing a radiator of this type we must first locate the leak, exactly. The best way to test a radiator is to first have a tank or tub large enough to submerge the radiator completely; then take three pieces of sheet brass

Digitized by Google

or copper, in one of which has been inserted a tire valve, clean the edges of the three openings in the radiator, namely the filler hole, the outlet, and the return pipes (in the case of a "V" type engine you will have four openings to close) and solder your plates on to each opening.

This, I admit, sounds like a lot of preliminary work, nevertheless, after the first job is completed, when you have your plates all ready, it takes but a few minutes to solder them on and you will be well repaid by the ease with which you can make the test. A cork will suffice to plug the overflow pipe and if it is not driven in too tightly will act as a safety valve. Now place the radiator in the tank, cover it with water and attach a hand or foot pump to the valve. Be very careful and sure to use a low pressure pump. Never, under any circumstances, use the air line from a pressure tank or air compressor. Just a few strokes with the hand pump will show every leak in a radiator.

If the leaks are in the frame or sheet metal parts of the radiator, you can safely mark them with any kind of a sharp point. If, however, the core is leaking it is better to mark the leaking cells by rolling a paper pill and putting it into the leaky tube until you take the radiator out of the water.

My reason for recommending the air test instead of a water test is as follows. If you desire to test with water it is necessary to stand the radiator upright in its natural position in order to fill it and also to have all parts of the radiator exposed for your inspection. You will probably stand it on a box or a couple of horses. The men who can fill a radiator under such conditions, without either slopping the water over it, or knocking the radiator off the stand, are about as scarce as the fellow Diogenes hunted for so long and to such little purpose.

When the sheet or smooth surfaces get wet it is, of course, a simple matter to dry them and locate the leaks. Not so with the section, should you spill a couple of tablespoonfuls of water over the core of a honeycomb radiator and then try to dry it with a rag or a piece of waste. Before you get it dry you will decide that the air test is better. Experience shows that, by far, the great majority of radiator leaks are found in the seams of the tank and the joints of the core and tank. The parts which are attached directly to the chassis, or which are in direct contact with the chassis, are the worst offenders.

Next in order are the outer edges of the core where they are joined to the tank. There are a great many cases of apparent leaks in the core which are really in the upper joint. The water oozes out, slips past any number of cells which happen to have enough of a grease coating to allow the water to pass without leaving a trace, and finally settles in a cell which may be anywhere from an inch to a foot away from the actual leak. Many a good radiator is transformed into a sieve by futile efforts to solder a leak which does not exist.

In soldering these joints be careful not to have the iron too hot. Use strip solder if possible, as it runs at a lower temperature than the heavy bar solder. Have the part thoroughly clean and work the solder *into* the leak. One grain of solder properly worked into a leak is better than a pound of solder smeared over the outside of the job. Use well killed acid in preference to any other compound as it helps to clean the surface in addition to its properties as a flux.

Leaks in the Core.

If the leak is in the core, the first thing to consider is its extent. If it is a case of occasional scattered cells, then, by all means, solder them up. To do this you will require a soldering iron (preferably a square one) which will enter the passage far enough to pass the center. The best tool for this job is a fairly large heavy iron which has been forged out from a little more than half its length and drawn to a square point, thereby leaving a heavy butt, which will hold the heat.

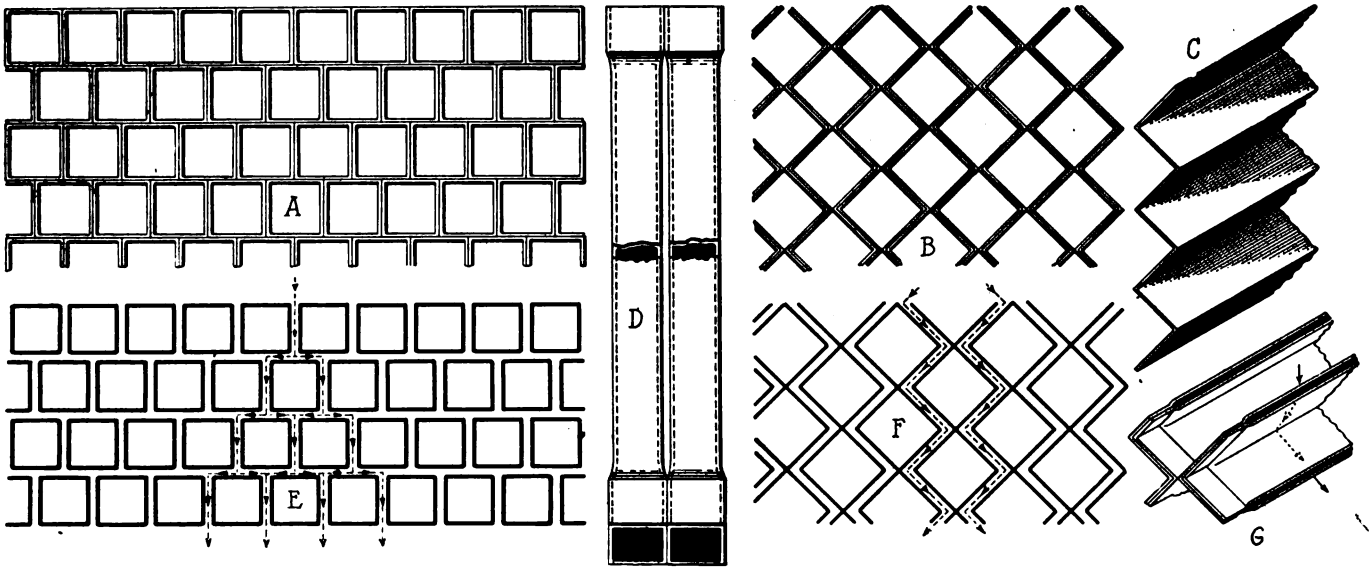

Fig. 1—Sectional Views of Various Honey-Comb Radiators. A, End of True Honey-Comb; E, Cross-Section of Same; C, Strip from Imitation Honey-Comb or Cellular; B, End of Cellular; F, Cross-Section of Same; G, Showing How It Is Soldered; D, Tube From Honey-Comb Radiator. Arrows Indicate Flow of Water.

Digitized by Google

Everyone who has had any experience with solder must realize the absolute necessity of having the metal to be soldered thoroughly clean. A minute speck of dirt or grease will leave a very much larger hole than itself in a soldered joint. Therefore, before wasting any time in trying to solder the tube, *clean* it. The best method for cleaning these tubes is to take a piece of rod, tool steel if possible, grind a chisel point on it, heat it, and make a very short right angle bend in it. With this tool one can scrape the inside of the tube and then proceed to solder up the leak.

You will sometimes find a case where the wall of an isolated tube has broken down completely. In that event it is simply impossible to get it sufficiently clean to hold the solder because of the dirt and corrosion which is present in the water passage. Where you have but one or two, or even half a dozen such leaks scattered over the radiator, the safest way to deal with them is as follows:

Clean the tube for a depth of about three-eighths of an inch from both ends. Then take a piece of wood and trim it down until it is square and a sliding fit in the tube; cut it off about a half inch shorter than the tube, push it into the tube so that the tube is open for about a quarter of an inch at each end and then fill both openings with solder. I do not recommend this method for wholesale use on a radiator. As you can readily understand, if you have enough of the air cells plugged in this fashion you will seriously affect the efficiency of the cooling system.

In the case of a radiator which has had a hole punched in it, or has been dented in such a way as to damage any considerable part of the section, the repairs are necessarily a more complicated proposition. The first point for consideration is, what kind of a honeycomb are you "up against"? Is it a true honeycomb as shown in Fig. 1 at A, or is it one of the dozens of different imitations, one of which is shown at B? If the former, you can remove the tube bodily by simply sticking a hot soldering iron into both ends of it. The real honeycomb core is just a mass of square tubes, soldered together for about a quarter of an inch at their length at both ends. The imitation consists of long strips of the shape shown at C, soldered together at the edges for about the same distance. It is, therefore, impossible to remove any part of the imitation without cutting.

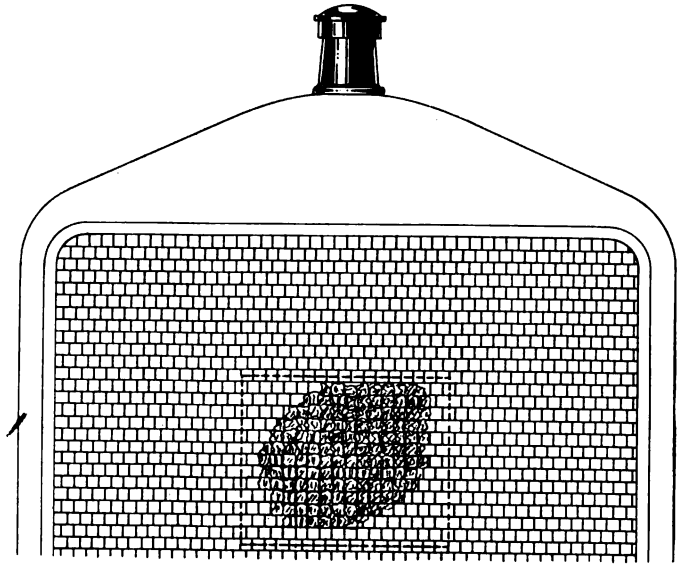

Fig. 2—A Badly Damaged Honeycomb Radiator and How It Was Repaired. Dotted Lines Show Portion Removed.

A man who is a real expert in the line can take a piece of almost any size out of a core and replace it with new section, without affecting the circulation; but it is a safe bet that the average radiator that is repaired in this way has no water circulating in the new section. The usual repair is made about as follows: Fig. 2 shows a radiator with a hole punched in the center. The tubes are smashed in and bruised out of shape in such a way that we know it is useless to attempt straightening them up and soldering them. The first thing to do is to draw a square around the damaged area, keeping the square as small as possible, at the same time making it large enough to include all the bruised parts, as shown by the dotted line in Fig. 2. Now take a very thin and very sharp chisel and cut away the bad part of the section.

For this part of the job you will require, in addition to a very sharp tool, considerable time and patience. Keep the chisel well away from the line you have set as a boundary and finish down to the line with a file. You should now have a square hole, the sides of which are quite smooth but full of tiny openings, through every one of which the water would pour. These openings must all be soldered up carefully and here again don't forget your patience. When you think you have it perfectly tight, test it and test it carefully, as you will have no chance to get to these leaks after you put the patch in place.

When you are satisfied that the radiator is watertight take the new piece or section and fit it into the hole, being careful to see that it fits snugly and that the tubes line up and match properly. Then, when it fits perfectly, solder it in at both ends. Work the solder in at least a quarter of an inch from each end, wipe it off clean on the outside and you have a good solid job.

It is well to remember that the main points for the success of this job are first to have the radiator thoroughly airtight before beginning to fit the plug and second to get a perfect fit on the plug before soldering it in.

(Editor's Note.—Our readers who intend to do radiator repair work should investigate the Dover electric soldering iron.)

(To be continued.)

How do you feel toward your competitors? Do you regard them as dark villains who ought to be in the front line trenches, or have you reached the modern standpoint of regarding them as co-operators, ready to make better conditions for business so that all may profit by it?

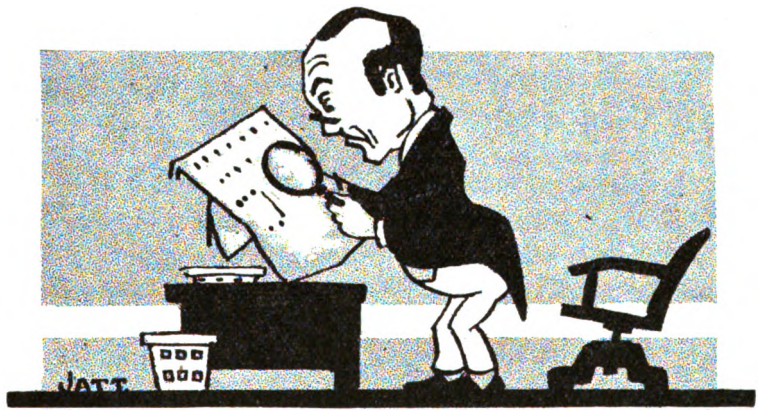
How to Place and Distribute Advertising So That It Will Give Results



4.—Daily Newspapers, of the Right Kind, Are Good Mediums For Dealers and Garagemen, But the Advertisement Must Be Distinctive

BY FRANK FARRINGTON
Illustrated by JATT

THE question of where to advertise is an important one when it comes to consideration of the use of newspaper space. Even if you never did any newspaper advertising, you realize that there is a vast difference in the newspapers of your town, whether they are weekly or daily papers.

One paper may have a large rural or suburban circulation and little circulation in the city proper. One may have a large mail subscription list and few newsstand buyers, or just the reverse. One may be sensational and perhaps cheap, with an appeal that makes it a favorite with the laboring classes. Another may be the favorite of the sporting fraternity.

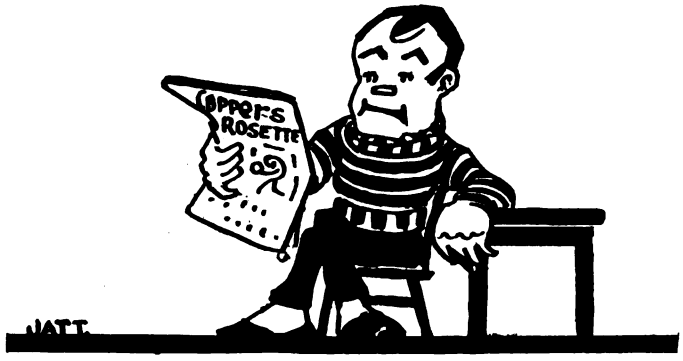
It is easy enough to see that the cheap sheet that is bought mainly by factory operatives and laborers is not the one that is going to reach the people who own or will buy automobiles. A paper that goes to farmers mainly is not the paper for the automobile dealer who wants to advertise town cars or limousines or high priced heavy type cars. On the other hand, it is just the paper that will bring the best results in advertising cheap and moderate priced cars.

Don't Expect Your Readers To Use A Magnifying Glass In Order To Read Your Advertisement. Use Enough Space. Don't Crowd the Words and Have the Type Legible.

A good many garage men, when planning to advertise in the newspapers, think that they are all pretty much alike and they take space in all of them regardless of class of circulation. This can only result in a waste of advertising money. You pay for the advertising space at a rate that is based on the entire circulation of the paper (and sometimes something beside), and all of that circulation which goes to people who are in no way possible producers of business for you is waste circulation as far as you are concerned. You pay for it but it does you no good.

So you should see to it that you use the paper, or perhaps papers, that have the kind of readers you want to reach. In advertising the repair department, although you may handle only low priced cars, you want to reach the high priced owners, so a paper that might not be suitable for your car advertising might be just the one for repair advertising. The proposition is simple enough in principle. Use the paper that reaches the people you want to have read your advertisement.

Don't be satisfied to use space occasionally. Occasional advertising will not produce even occasional results. That is the reason so many men say that advertising does not pay them, that they have tried it and it did not get them any business. There is only one way to make newspaper advertising pay profitably and that is to stick right to it, week in and week out, hammering away constantly.



And don't, please don't, put one advertisement into the paper and let it run the same indefinitely. People will not read stale news. They would throw away a paper that printed the same news over again the second day. You surely cannot expect them to read advertisements over and over again. Your advertisements are not going to be so much more interesting than news.

I know you may say that if you run the advertisement the second time someone may see it who missed it the first time. Well, that someone will see your new advertisement just the same as they would the old one and the people who saw the old one will read the new one, too. There is no excuse for repeating advertisements. You may lack time to get up a new ad. Provide in advance for such a contingency by having some new ones always ready for the busy times.

Location of the advertisement in the paper is almost as important as choice of a paper. You know of pages in your newspaper that you never look at, seldom turn to at all. What pages they are depends upon what your

Digitized by Google

interests are. Automobiles and automobile repairs are subjects you want to advertise to all classes of readers. You do not want to restrict your advertising to the baseball fans, so you will not choose the sporting page for your space. You do not want to restrict it to the

A High Class Automobile Advertisement Will Not Bring Results if Placed in a Sporting Paper.

church workers, so you will not go on the page devoted to religious interests. Similar reasons may eliminate other pages. But everyone who takes the paper is interested in the local news, so you will try to get the kind of space you want on the page that talks about what folks in your town are doing. You know that everyone looks at that page—perhaps first of any and longest.

Get space in the right paper, on the right page, and then try for the position you want on that page. First off you will not be able to get the best space, because that will be in use by older advertisers. But if you continue to use space on that page, while others drop out, or change, you will in time have the rights that seniority gives. You will get the best space for your business.

Consider something beside the cost in deciding what size space to use. The automobile business is regarded as being a rather large one. A garage is not a small affair. Use space that bears a proper proportion to the size of your business as it looks to the public.

If your business is small or new, or if you are really short of funds, use a small space, a real small space. Perhaps two or three inches, single column, will enable you to call attention to your repair shop. Small space like that will not be out of place in advertising repairs or certain accessories and supplies, but it does not convey the impression of the successful distribution of cars. In advertising cars, you ought to use five inches or more, double column and rather than use a space so small that it gives the impression that you are kind of a "piker" dealer, use the space less frequently, perhaps three times a week in a daily paper. You ought not to cut the weekly paper advertisement down to less than once in two weeks.

The kind of advertisement you use will depend, of course, on the amount of space, the type of newspaper and the class of trade you want. But any advertisement should be adapted to a style you want to follow in order to get people accustomed to it. You want people to recognize your advertisement at a glance, and you want to make the advertisements so attractive that people will look for them.

Instead of allowing the printer to set up your advertisement in any type he wishes, see that he uses a type that is suited to it, and then have the same type used every time. Follow a uniform style of typography. See that your advertisement is set in a type different from that of the advertisements around it, so that it will be different and stand out more. You probably do not know anything about typography, but that does not mean that you cannot follow out this idea. Go and see the man who sets up your advertisements and have him show you the different styles of type he can use for your advertisement. Then you and he choose the one that is best and stick to it. If there is no assurance that you will not find the same type used by the man whose ad is right adjoining yours, you may be willing to buy a font of a special type for your own exclusive use for headlines and display lines in your own advertisement alone.

Be Distinctive and Original.

You ought at least to have a distinctive type for the name or signature to your advertisements. The best way is to have a nameplate drawing made, showing "King's Garage" in a unique lettering, or if you write it in a rather striking form with a pen, have a cut made reproducing the signature just as you write it. Such a cut will cost very little and the printers will get it for you. You would want it made in several sizes so you could use it on advertising of all kinds, and you may even want to use it on your letterheads. The idea is to make that distinctive nameplate an identification

Be Careful in Preparing Your Copy Not To Make It Read Like a "Mess of Hash."

mark for your advertising, just as Kellogg's name on his corn flakes advertising and packages is a distinctive signature.

It is a good plan, too, to follow a certain style of make-up in your advertisements. You might always run a heavy headline and a single descriptive line under it always in italics. You may set your headlines clear to the left-hand margin of the space and then indent the

Digitized by Google

rest of the advertisement half an inch, that is, leave half an inch of margin all the way down below the

The Sporting Pages May Attract Attention But the Readers May Not Care for Your Product.

headline. Here is a sample of the way the two above ideas would work out. First, with the italics sub-head.

WE MAKE QUICK REPAIRS.

No Garage Gives More Prompt Service.

When your car gets out of order, you want it right away. You never seem to need it as badly as when it is broken.

We make a specialty of quick service where the car is wanted for immediate use.

If we can't make a permanent repair in time, we can often make a temporary repair that will help. When parts are not to be had promptly, and that is often the case now, a temporary repair that gives you your car for careful use at least, helps a good deal.

Anyway, when something goes wrong, come right to us and we will give you immediate attention at least to the extent of telling you how long repairs will take.

KING'S CENTRAL GARAGE.

Here is the sample of the advertisement with the body matter indented and the heading set close to the left-hand margin:

THERE'S ODDS IN OIL!

Some motorists buy and use oil on the apparent plan of believing that oil is oil and that one oil is as good as another.

They buy the cheapest because it looks as if it would save them just that much money.

You probably don't buy oil that way, but maybe some of your friends do. Compare notes about oil results, about burnt out bearings and about a lot more results from poor oil.

A customer of ours said the other day, "I used to pay 50 cents for oil and I thought it was high at that. That was before I had the car overhauled and found what poor oil was doing to the motor. Now I pay 85 cents for oil and if I could find an oil that cost a dollar eighty-five I'd buy that. You can't make me believe the cheap oils are cheap in the end."

Let us show you what Tinkertown Oil will do in the way of saving wear and tear and making the car work right seven days in the week.

KING'S CENTRAL GARAGE.

The plan followed by the advertisers whose space is next to yours has its influence on the plan you adopt. If the adjoining advertisers all leave a wide margin of white space around the type matter in their ads, you can set yours pretty close to the line and thus profit by their white space and have more room for reading matter. On the other hand, if they all set their space full of type and leave no margin, then you must provide your own margin. You must have a margin if you want your advertisement to stand out. The proper use of white space in an ad is almost as important as the proper use of type matter.

Sometimes an advertisement can be made to stand out without white margin, but it must be done by main force. If you are using a single column space and the advertisements around you or the adjacent reading matter all appear in comparatively small type have your ad set in 18 point type. The printer will show you what this size is. A "point" in type size is a seventy-second of an inch. The reading matter on this page, for example, is 10 point. Don't have the advertisement set in capital letters but in small letters, and if you are carrying out this plan use a black face type, one that is heavier than ordinary. In this way you make your advertisement so black and conspicuous that it compels attention. This is not an artistic method of getting attention, but sometimes it pays, and, after all, the test of a successful advertisement is its pulling power.

The inexperienced advertiser often crowds his space, puts in too much matter. He is anxious to get his money's worth. Unless you use space large enough to subdivide it somewhat, as the department stores do, it is better to try to make just one point, to impress just one thing upon the reader, so he will pass on, remembering one thing rather than forgetting a dozen. One good point driven home is enough. Accomplish that with each appearance of your advertisement and you have done as much as you need to do.

Do you pay yourself a regular salary? No matter if you are in business for yourself—what of it? You should take every Saturday night as much as you could earn by the same effort if you worked for someone else. Then charge yourself up at cost price with anything you use out of the business. That is the only way to keep matters satisfactory and to know at the end of the year whether you have gained or lost.

The A B C of Modern Magnetos and Electric Generating Systems.

Part 2.—How Current Is Generated in the High Tension Magneto and Directions For Installing and Wiring This Important Unit

BY A. P. PALMER, E. E.

A MAGNETO is a machine for generating current of the simplest and most direct kind. An armature is revolved between two ends of a permanent magnet to which pole pieces are attached. As the fields are permanent no excitation is required and hence no field coils.

A magneto adapted for four cylinder ignition is shown in section in Fig. I. It consists of an armature revolving between the cast steel pole pieces of two permanent magnets. The armature has two windings, one of heavy wire and the other of very fine wire. The heavy wire constitutes the primary or low tension circuit and the very fine wire the secondary or high tension circuit.

The rotation of the armature between the poles of strong permanent magnets sets up or induces a current in the armature primary circuit and this is further augmented at regular intervals in the rotation of the armature shaft by the abrupt interruption of the primary circuit by means of the magneto interrupter. At the opening of the primary circuit the resulting discharge of current from that circuit induces a current of high voltage in the armature secondary circuit. The high tension current thus created is collected by the slip ring on the armature and passed through the slip ring brush, then to the various magneto distributor terminals, each of which is connected by cable to the spark plug in its respective cylinder. The electrical circuit is shown in

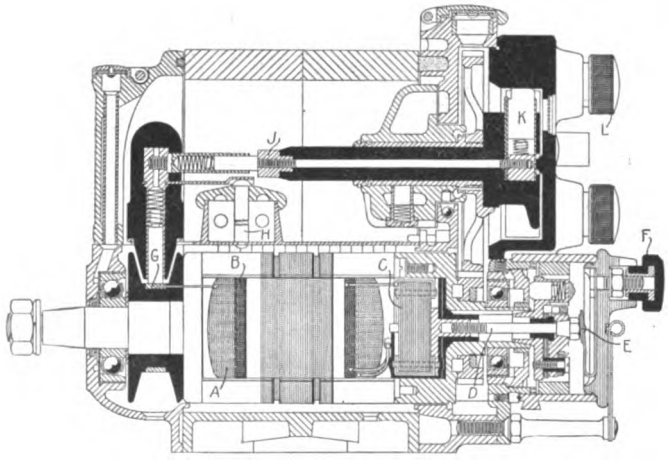

Fig. 1—Sectional View of High Tension Magneto. A, Secondary Winding; B, Primary Winding; C, Condenser; D, Primary Contact Screw; E, Contact Spring; F, Grounding Terminal; G, Secondary Ring; H, Safety Gap; J, Secondary Connection Post; K, Distributor Brush; L, Distributor Terminal.

Fig. 2 at A while a six cylinder distributor is shown at B.

The beginning of the armature primary circuit wire is in metallic contact with the armature core, and the end of the armature primary circuit is connected by means of the interrupter fastening screw to the insulated contact block supporting the long platinum contact on the magneto interrupter. The interrupter lever, carrying a short platinum contact, is mounted on the interrupter disc, which in turn is electrically connected to the armature core. The primary circuit is completed whenever

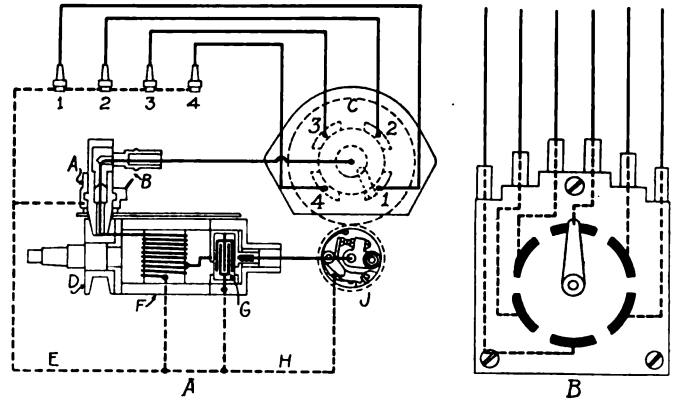

Fig. 2—A, High Tension Magneto Circuit; B, Six Cylinder Distributor. Small Letters—A, E, & H, Indicate Ground; B, Secondary Lead Wire; C, Distributor; D, Secondary Collector Ring; F, Armature; G, Condenser; J, Breaker Box.

the two platinum interrupter contacts are brought together, and interrupted whenever these contacts are separated. The separation of the platinum contacts is controlled by the action of the interrupter lever as it bears against the steel segments secured to the inner surface of the interrupter housing.

The high tension current is generated in the secondary circuit only when there is an interruption of the primary circuit, the spark being produced at the instant the platinum interrupter contacts separate.

Secondary or High Tension Circuit.

The armature secondary circuit is a continuation of the armature primary circuit, the beginning of the secondary being connected to the primary, while the end of the secondary is connected to the insulated current collector ring, or slip ring, mounted on the armature just inside the driving shaft end plate of the magneto.

Metal segments are imbedded in the distributor plate and as the distributor brush rotates it makes contact successively with the segments in the distributor plate.

The segments in turn are connected with the terminal studs on the face of the distributor plate, and the latter are connected by cables to the spark plugs in the different cylinders. In the cylinders the high tension current produces a spark which causes ignition and then returns

Digitized by Google

through the engine to the magneto armature, thus completing the circuit.

In order to protect the armature and other current carrying parts, a safety spark gap is provided. Under ordinary conditions, the current will follow its normal path to the spark plug, but if for any reason the electrical resistance in the secondary circuit is increased to a high point, as when a cable becomes disconnected, or a spark plug gap too wide, the high tension current will discharge across the safety gap.

The current should never be allowed to pass across the safety spark gap for any length of time, and if the engine is operated on a second or auxiliary ignition system, the magneto must be grounded in order to prevent the production of high tension current. The snapping sound by which the passage of the current across the safety gap may be noted should always lead to an immediate search for the cause of the difficulty.

The safety spark gap is located on the dust cover over the armature, and consists of two short pointed electrodes supported a short distance from each other; one electrode is set on the dust cover itself and enclosed by a metal and wire gauze housing, while the other, or insulated electrode, is set in the center of the steatite cover of the safety spark gap housing and connected into the secondary circuit of the magneto.

Timing Range.

The magneto interrupter housing is arranged so that it may be rotated through an angle of 35° with respect to the armature shaft. The movement of this housing in one direction or the other causes the interrupter lever to strike the steel magnets earlier or later in the revolution of the armature, the spark occurring correspondingly earlier or later in the stroke of the piston. The spark can be advanced by moving the interrupter housing by means of the timing control arm, in the direction opposite the rotation of the armature and can be retarded by moving the interrupter housing in the same direction as the rotation of the armature. The armature rotation

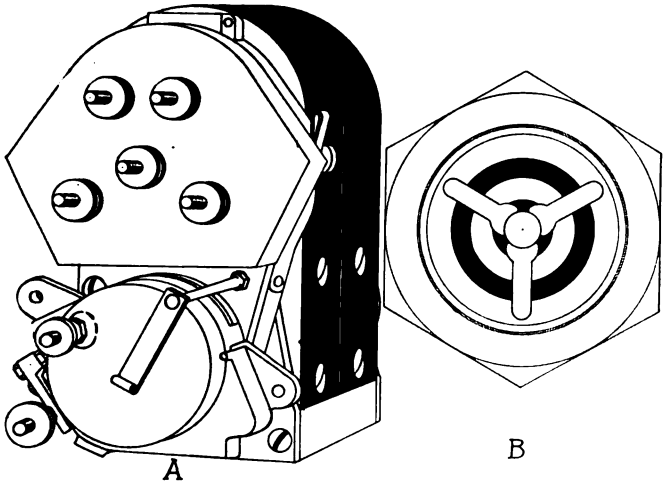

Fig. 3—A, Typical High Tension Magneto; B, Multiple Point Spark Plug.

is indicated by the arrow on the oil well cover at the driving shaft end of the magneto.

Since high tension current is generated only on the interruption of the primary circuit, it is evident that in order to cut out the ignition it is necessary merely to divert the primary current to a path which is not affected

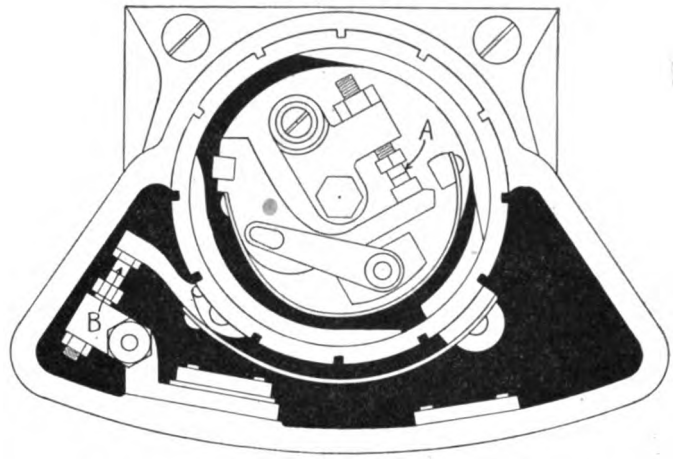

Fig. 4—Breaker Box of Dual Magneto. A, Magneto Breaker Points; B, Battery Breaker Points.

by the action of the magneto interrupter. This is accomplished as follows:

An insulated grounding terminal is provided on the cover of the magneto interrupter housing with its inner end, consisting of a spring with carbon contact, pressing against the head of the interrupter fastening screw. The outer end of the grounding terminal is connected by low tension cable to one side of a switch, and the other side of the switch is grounded by connecting another cable between it and the engine or chassis.

When the switch is open the primary current follows its normal path across the platinum interrupter contacts and is interrupted at each separation of these contacts. However, when the switch is closed the primary current passes from the head of the interrupter fastening screw to the carbon contact of the grounding terminal, thence through the switch to the engine and back to the magneto, and as the primary current remains uninterrupted when following this path no ignition current is produced.

Plug Gap Too Wide.

The distance between the electrodes of the spark plugs varies according to the individuality of the engine, but normally this distance should not be less than 1/50 inch. On the other hand, however, too wide a gap increases the electrical resistance, and interferes with the proper generation of current at low speed. Difficulty in starting an engine and missing at low speeds are very often due to the spark plug gaps being too wide and, as the spark will have a tendency to burn the electrodes and thereby gradually increase the gap, it is especially important that the plugs be examined occasionally for assurance that the gap is not too great; any difficulty due to this cause may be readily overcome by readjusting the electrodes.

Air gaps placed in the high tension circuit between the magneto and the spark plugs for intensifying the spark only increases the length of the gap and the resistance to be overcome and should not be used.

Digitized by Google

The platinum interrupter contacts should be examined for the correctness of their adjustment and they should be so set that they are separated by a distance of 0.4 of a millimeter (about 1/64 inch) when the interrupter lever is resting on either of the segments in the interrupter housing.

Installation of Magneto.

Since the magneto produces an ignition spark only at certain definite points in the rotation of its armature, it must be connected to the engine in such a manner that the spark is available always at the instant when required in the cylinder, i. e., about top dead center of the compression stroke. The magneto, therefore, must be positively driven from the engine by a method of drive that

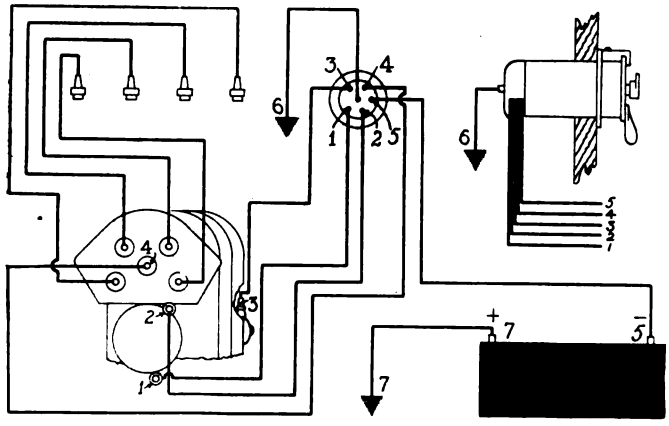

Fig. 5—Low Tension Magneto With Coil.

will eliminate slippage; belt or friction drive cannot be used.

In a four cylinder four cycle engine, with a magneto producing a spark every 180° revolutions of the armature, the speed of the engine crankshaft and magneto armature should be the same. With a six cylinder engine, four cycle, the magneto is run at one and one-half times engine speed.

The magneto should also be installed so as to revolve in the direction in which it is to run as indicated by an arrow sometimes placed at the shaft end of the magneto.

Timing the Magneto.

1. Find firing order of the engine.
2. Set number one. Piston on the beginning of the power stroke (by watching the exhaust valve just closing on No. 4 cylinder).
3. Set flywheel so that the mark (1 and 4 TC) registers with pointer.
4. Retard the spark fully by moving the breaker box in the same direction as arrow points, or armature rotates, as far as it will go.
5. Rotate armature in proper direction until interrupter points are just about to open.
6. In this position mesh gears and lock magneto to base.
7. At this point verify the setting by advancing the spark, if points are right they will open.
8. Notice what point in distributor the rotor is touching, this connects with No. 1 cylinder.
9. Wire distributor in firing order of engine, remembering that the distributor always rotates in the opposite direction to that of the armature.

It has been found in practice that with an ordinary four cylinder, four cycle engine running at a speed of 125 R. P. M., the spark may be advanced 1/10 inch while with a speed of 1,500 R. P. M. it may be advanced 1.2 inch of piston stroke.

More power is obtained by two spark plugs firing simultaneously in the same cylinder on opposite sides than with one spark plug as the compressed mixture of air and gas is ignited at two different points at the same time and consequently less time is required for the flame to ignite the entire charge.

There is an advantage in using spark plugs with more than one spark jumping point so that if one point gets sooted up the others may be in better condition and the cylinder will not miss fire. Such a plug is illustrated at B in Fig. 3.

Motor Dynamo.

A motor dynamo as used in automobile lighting and starting systems is a generator and motor combined on one shaft with separate windings for each purpose. Two field windings are used, one a series winding for starting motor purposes and the other a shunt winding for the generation of current. Sometimes an additional winding

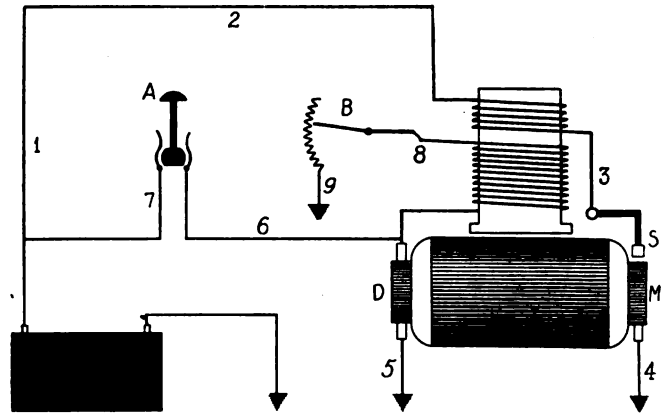

Fig. 6—Circuit Diagram of Typical Motor-Generator.

is used for regulation of the dynamo output. In this case there will be three windings. The field magnets will have a shunt winding for generation, a heavy series winding for starting purposes and a reversed series winding for output regulation.

Another system uses a third field winding for regulation purposes but not the reverse series method. One particular system uses a compensating coil on one of the field magnet poles, this coil being energized through the current drawn off the commutator by a regulating brush. This coil assists the shunt windings at low speed, but opposes them at high speeds by the reversal of the current through the regulating brushes.

Another class of motor dynamos uses a shunt and series field winding and also provides separate windings and two

Digitized by Google

separate commutators for the armature. The connections are shown in Fig. 6. With the engine idle the open cut-out switch disconnects the battery from the brushes on the dynamo commutator D and also from the lower shunt field. The dynamo or current generating part of the unit is therefore inoperative. When the starting switch S is closed current flows from the battery through the wires 1 and 2 to the upper series field and then through the wire 3 to the brush resting on the motor commutator M. Passing through the motor windings on the armature, the current returns to the battery through the wire 4 and the engine is started.

With the engine started, the switch S is allowed to open and the series field and motor windings on the armature are no longer energized. The motor dynamo is then driven by the engine as a dynamo and with the cutout switch closed, current flows from the dynamo commutator D through the brushes and wires 5, 6 and 7 to the battery for charging. The shunt field is connected to the dynamo commutator brushes and the flow through the field windings is controlled by the regulator. The shunt field current passes from the upper brush through the field windings, then through wire 8 to the regulator and back through wire 9 to the lower dynamo brush.

Automobile Body Painting and Refinishing

Many Second Hand Automobiles Will Be Exchanged This Season and the New Owners Will Probably Want the Car Bodies Refinished

BY ROBERT W. SMITH

I WANT to give in this article an account of some methods employed in England in the painting of automobile bodies. A part of the information that I shall give relates particularly to methods of securing uniformity of results where the body is partly of wood and partly of metal. But this is by no means all. We can often learn much from those who have the same problems and yet have attacked them in a different way. To the readers of this article it is suggested that they read with an open mind. They may find some very useful things that will fit in with what they are already doing. I am indebted to an account by Mr. Charles E. Oliver for my main points.

In English practice, there appear to be three leading methods of treating automobile bodies. These may be summed up as follows:

1. Painting and varnishing.
2. Finishing with enamel.
3. Combining enamel and varnish.

The first method is not greatly different from good practice in coach painting. There are 21 operations beginning with the priming and closing with a finishing coat of varnish.

The second method is carried out in 10 operations. These are:

1. Priming.
2. Stopping.
3. Knife filling with enamel paste.
4. Brush filling with thin enamel paste.
5. Checking coat. (This may be omitted.)
6. Rubbing down.
7. Ground coat of flat enamel.
8. Half gloss enamel.
9. Finishing coat of gloss enamel.
10. Lining and picking up in enamel colors.

It is understood that about 18 days are required for the first method, but that a week is sufficient for the second. "If we follow the second method through, however, we shall find that it is giving most excellent results, and is made possible by a careful study of the materials used and the method of their application. * * * It must also be remembered that the less material of a hard non-elastic nature is used on motor car work the better. The resultant problem is [to find out] what is absolutely necessary to produce a good surface and no more."

Combination of Wood and Metal.

The first item in the enamel process relates to priming. Where there is a combination of wood and metal surfaces in the automobile body it is not an easy matter to get the same final effects on the one material as on the other. There is apt to be a difference in results with the two materials. However, a method has been worked out in accordance with which, it is understood, uniformity of appearance may be secured. It is a question of giving the surfaces a preliminary treatment before applying any priming. First, a drying oil is made ready. Following is the recipe for it:

Linseed oil	2 parts
Gold size	1 part
Turpentine	1 part

When these ingredients have been thoroughly mixed, the liquid may be applied to the body of the automobile. Plenty of it is to be used, particularly with the wood. The object in view in the latter case is to give the wood all it will take. Before either surface has dried off, a scouring operation is carried out by means of a block of wood with a flat surface on which a cover of glass-paper has been arranged. Finally, a cotton rag or an equivalent is used to wipe off the surfaces. In the course of half

Digitized by Google

a day or thereabouts, it will be found that the wood and the metal surfaces have much the same appearance and that the *same priming* may be used indifferently over both materials of the body. The recipe for the priming coat is as follows:

Tub lead.
Lamp black (pure).

These are to be mixed with a thinner made by using equal parts of linseed oil, gold size and turpentine.

Instead of the preliminary drying oil used in the foregoing, we may substitute a double procedure. First, we use a very oily primer for the wood surface. We allow this to stand over night; and then apply a sharper coat over the entire surface of wood and metal. Another procedure "is the use of a coat of thin shellac, knotting direct upon the wood, followed by the coat of priming over all. The chief recommendation of this method is the speed with which the paint dries and can be followed up.

As to the knife filling mentioned as Item No. 3 in the enamel method, it will be perhaps unnecessary to say anything, as it is a procedure possibly better known in America than in England.

Rubbing down may advantageously be done by using fine pumice stone and finishing with cuttlefish stone.

We come now to the sharp diversions between the older paint and varnish method and the modern enamel process. In the older procedure, a great many coats of lead paint follow one another. It seems that the smoothing effect of the rubbing down with the stone is more or less nullified by the next coat of paint, so that it becomes necessary to rub down and paint, rub down and paint, for quite a number of operations. With the enamel method, pretty much all of this slow advance by contrary treatments is cut off at a clip.

Surface Smooth to Start.

We now assume that a smooth, flat surface has been secured. With the enamel process we have only four more operations; whereas with the paint and varnish procedure there would still be nine. We now put on our ground coat of enamel with a fine brush. There will be a better surface than with the lead, so that we will not have to rub down with any kind of stone or the like, except to a rather small amount. We may, here and there, have to treat spots with cuttlefish bone, and we may have to go over the second enamel coat. Furthermore, we are putting on twice as much body of color as we would with a lead coat. Note well, however, that, whatever the final tint or shade desired, precisely that tint or shade is to be put on now with the ground coat.

The next operation is the application of what is called a half gloss coat of enamel. We prepare the enamel by mixing the flat enamel used for the ground coat with the finishing gloss enamel which is to come next. The mixture is properly made by the following formula:

Flat enamel ..... 2 parts
Gloss enamel ..... 1 part

A fine brush is to be used. "There is much diversity of opinion as to what really constitutes the brush most suitable for this purpose. My own view is that the American style of fitch hair-brush, used for 'presto,' is the best. This is an important question, as your decision makes or mars the job. If these coats are applied in the right way, the labor of rubbing down is reduced to the absolute minimum, and the level surface left by the rubbing stone is retained."

Pumice powder and water are now applied in a "flatting down" procedure. Cuttlefish bone may be needed occasionally. The flatting down process has now the advantage of being applied to two heavy coats of color. Further, there is yet another heavy coat to be put on. This will correct slight deviations from standard. "Thus the operation of flatting down is not particularly delicate. Perhaps the most important aspect is the removal of all traces of pumice from the surface by repeated washings. * * * There is just one point to note in connection with this process of painting. It will be observed that the laborious work has been largely eliminated. The preparation, perhaps, calls for more care and a little more skill than the older methods." In effect, it requires more brains but less muscle. Let the painter do the flatting down himself and not let an inexperienced laborer do it. It lasts only a moderate time and is not to be compared to the rubbings down of the old procedure.

We come now to the finishing coat of enamel. It is understood that it requires much more skill than varnishing. "To the beginner it is more difficult than varnish. After a little use, it becomes easier. There is not the same difficulty in obtaining a solid finish. The tops of panels are as solid in color as the middles.

The most difficult feature to the painter unaccustomed to enamels is their heavier nature and stronger body than the varnish with which he is familiar. He commences by working too much surface in one operation. The less enamel is crossed and worried the better will be the result. Large panels should not be laid in all over before laying off. A double brush width should be laid in vertically, starting at the right hand side. This should be crossed once only, and immediately laid off firmly up and down, and left alone. The next width should be laid in the same way and crossed into and not out of the first stretch. This is done in order to avoid any marks of the brush end. Lay off up and down and leave alone. By this method it matters not how big the panels—and panels of fair size are used on the modern motor car. One man can keep them going without any trouble.

Vertical Application Best.

There is a warning to be heeded, in connection with the application of this final gloss coat of enamel. Vertical handling of varnish is better than horizontal. This is true of enamel—only to a more decided degree. Thus, it may be permissible with varnish, when flowing it vertically up to a horizontal molding, to give a single horizontal stroke with the brush just under the molding. But with enamel, this is not permissible. The finishing

Digitized by Google

stroke must be a vertical—a light, down-going stroke is the thing.

Lining and picking up constitute the final operation. It is carried out with enamel colors. "This presents no great difficulty to a man used to lining, though at first he may feel somewhat strange with the heavier material and in view of the necessity of applying it to a shiny ground. A little practice will soon overcome these points."

We have had before us the old paint and varnish method and in some detail modern British practice in enamel painting. Let us now give a little attention to what may be called a third procedure. It has usually been thought superfluous to gild the lily. But that is just what this third method proposes to do. In short, the second method is pursued to the end or nearly to the end, and then the gloss enamel is covered with a finishing coat of varnish. "To the coach painter who has never tried it, the result of a coat of good varnish upon a fine enamel surface is a revelation; and I would invite any who are wedded to the varnish finish to try the experiment of painting one panel in delicate or difficult color, and enamel a second panel in the same color, and then varnish them both with the same varnish. When quite dry, examine them in a strong light, and the superiority of the varnish-enamel will be at once revealed." Apparently, then, whenever we want just about the finest finish and effect obtainable, we enamel first and then varnish. In carrying out this program in actual practice, we may or may not omit the lining and picking up until we have flatted down the final gloss coat of enamel. After the flatting down is over, we do the lining and picking up, if not already done, and apply our coat of varnish.

Joining and Adjusting Repair Shop and Garage Machinery Belting

2.—The Use of Guide Wheels, Figuring Pulley Speeds and General Driving Belt Installation, Should Be Understood Thoroughly by Every Garage and Repair Man

BY J. F. SPRINGER

IF the two pulleys are not too close together, no additional means will be required on the tight side to keep the belt running true. A guide wheel, however, may be needed on the slack side to prevent the belt from slipping from the pulleys.

In arranging for two pulleys, at right angles, as in the foregoing, be sure that the belt face of the rims of both pulleys is crowned. That is, see that the pulley diameter is at a maximum along the center line of the face and diminishes gradually to both edges. It is usual to curve the surface. This coning of the face of the rim is very similar to what is done when finishing the surface of a roadway in order to provide for drainage to both sides. The amount of crowning varies somewhat in practice. An average amount is about one per cent of the width of the rim face; see Fig. 4. Thus, for a four-inch face pulley, the center would be 0.04 inch higher than the sides. The maximum diameter would be twice this amount, or 0.08 inch, greater than either of the two minimum diameters. Some pulleys will be crowned a little more than this; others, less. Crowning is necessary to keep the belt on the pulley. A belt will tend to run where the stress is greatest. The crowning locates the greatest tension at the center of the face of the rim, because there the belt is stretched the most.

Crossed belts will be found useful, sometimes, in providing a simple means of reversing a turning-lathe. The crossed belt may then be arranged between counter shaft and the head stock of the lathe.

It will be understood that the length best for an open belt will not be the best for a crossed or quarter-twisted belt, even if it happens that the same belt can be put on the variously arranged pulleys. To get the proper lengths, use the tape line, putting it on the pulleys just as the belt is to be used and then deducting the proper percentages already given for open belts, in order to allow for tension.

Different Pulley Speeds.

Sometimes it is desirable to get a higher speed of rotation or a higher surface speed from a machine than the ordinary arrangements permit. For example it may be desired to operate a grinding attachment in connection with a lathe, the spindle of the lathe providing the means for turning the work and some special counter-shaft arrangements being used to drive the grinding spindle. There should be no trouble about getting the proper speed from the lathe spindle. The trouble centers on the spindle carrying the grinding wheel.

In order to do grinding advantageously, it is practically necessary to rotate the grinding wheel at such rate that the edge which does the grinding shall be moving at the rate of 60 miles an hour or faster. Approximately 6,000 feet per minute may be regarded as representative of the best American practice. This speed is not at all easy to get with ordinary arrangements. Consider a moment. Suppose the line shaft is running at 150 r. p. m. and that it is belt-connected to the regular lathe counter-shaft, the arrangements being such that the counter-shaft rotates twice as rapidly—that is, at 300 r. p. m.

Now if the little grinding wheel has a diameter of

Digitized by Google

1 15/16 inches, it will have a circumference of just about 6 inches. This is one-half a foot. To get 6,000 feet per minute at the rim of the wheel, it must revolve 12,000 turns of the spindle in the same time. This rotational speed is forty times as fast as that of the counter-shaft, and consequently would require, if it is to be obtained directly from it under present arrangements, that the driving pulley on the counter-shaft should have forty times the diameter of the grinding wheel—that is, 40 × 1 15/16 = 77½ inches, or about 6½ feet. This would

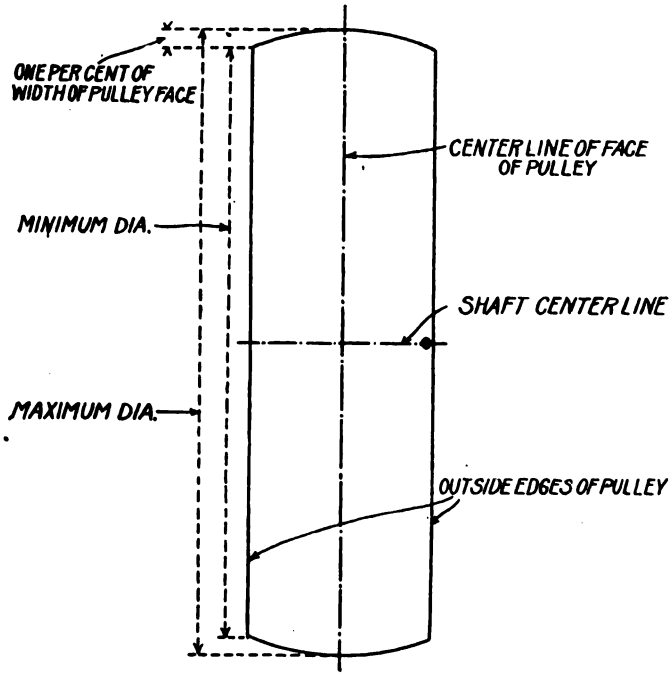

Fig. 4—Illustrating Measurements and Terms Relating to a Crowned Pulley.

be absurd. What is needed is a special counter-shaft. It may be operated from the usual counter-shaft and serves to increase the speed before reaching the grinding spindle.

Altogether forty times the speed of the first counter-shaft is necessary. As forty breaks up readily into the factors eight and five, the two shafts may be connected in such a way as to obtain with number two five times the speed of number one, then to connect number two wtih number three or the grinding shaft so that number three will revolve eight times the speed of number two.

Obviously, then, the pulleys to use on shafts number one and two should be of such diameters that the ratio of the diameters is five to one; and the ratio of the diameters of shafts number two and three is eight to one.

If it is necessary that the grinding shaft or shaft number three, travel at 12,000 r. p. m. the ratio should be made slightly greater, in order to cover possible belt slippage.

Diameters of Pulleys.

In the present case, ignoring slippage, the grinding shaft revolves at 12,000 r. p. m. the counter-shaft number two at 1,500 r. p. m. and shaft number one, or the driver at 300 r. p. m. The several diameters might then be as follows: number one 20 inches; number two driven four inches; number two driver 24 inches and number three driven, or grinding shaft wheel, three inches. If there is a great amount of slippage, or it is necessary to drive the third wheel at 12,000 r. p. m. the latter pulley may be made slightly less than three inches in diameter.

Since any speed above 2,000 r. p. m. is considered high, one should be careful in the construction of the bearings and rotating members. The pulleys should be very carefully balanced and the bearing boxes firmly fastened into place.

Belt Shifters.

The use of a belt shifter is necessary and proper, especially where a shift from a loose pulley to a tight, or the reverse, is to be accomplished overhead. However, not all belt shifters are equally good. There is one type in the long rod or handle which extends down from overhead is to be set to one side or the other of the vertical. This may make trouble. The force of gravity tends to pull the handle to the vertical. This may result in the belt working partly on the tight pulley and partly on the loose one, and a considerable wear and tear on the belt.

There is a simple way of avoiding all such trouble. A device described by R. T. Kent in his book on *Leather Belting* is shown in the accompanying figure; see Fig. 5. The two overhead pulleys are appropriately marked L and T (loose and tight). The long handle which extends down to the vicinity of the workman is shown, but only in its upper part, to the right of the hangers and the pulleys. It may be swung on its pivot to right and left. If shifted to the left, it will bear against the pin B and cause the pin and also the horizontal rod marked A to move to the left. The two fingers, one to the right of A and the other to the left, will carry the belt (not shown) from the tight pulley onto the loose one. This

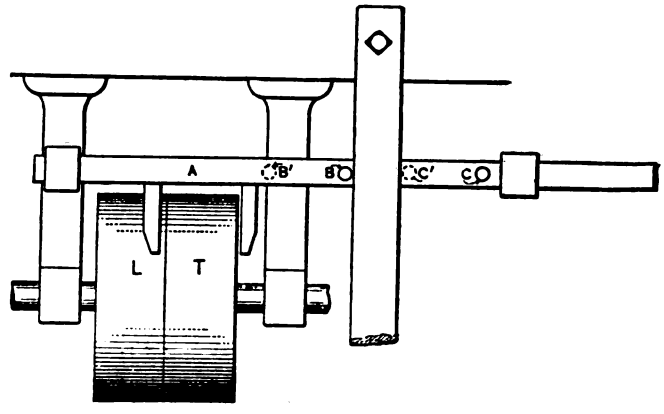

Fig. 5—A Belt Shifter Described by R. T. Kent in Leather Belting.

will bring the pin B to the position Bl. The shifting handle will drop to a vertical position when the band releases it. This will have no effect on the horizontal rod, unless the pin C is wrongly placed. Its function is to afford a means of shifting the horizontal rod back to its original position. But the pin C should be so sit-

Digitized by Google

uated that when the shifting rod is moved to the right, the belt will begin to move to the tight pulley T. A proper position for C will be Cl at the moment when the horizontal rod is fully over to the left. The foregoing means that B and C are to be moved the width of one pulley.

We now have enough information to give us the basis for placing the two pins. Arrange the shifting rod exactly vertical, just as in the figure. Then set the horizontal rod to the position where the two fingers which do the actual shifting of the belt are in the position shown in the figure. Then mark the positions B and Cl —one just to the left of the vertical rod and the other just to the right.

Measure from the center of Cl to the right a distance exactly equal to the belt shift. Ordinarily, this should be the horizontal distance from the center of the face T to the center of the face L. We now have the position of the center of C. Bore holes at B and C and insert the pins. The quiescent position of the rod is vertical and not to one side or the other. When the belt is on the tight pulley (as in the figure), the shifting rod will hang vertical with the pin B close on the left. The pin C will be at a distance to the right. After the shift of the belt to the loose pulley, B will be in the position of Bl; and C will be at Cl with the rod hanging vertical alongside. In neither position will the shifting rod tend to move either to right or left, since it is already vertical.

SOME EASY MONEY.

A Marvelously Large Gold Mine Will Soon Be Opened by the Tractor Manufacturers. Everyone Should Try for Their Share.

ALL of us remember what big profits were made in the first part of the twentieth century by automobile agents and salesmen. We doubt if any other business held forth such rosy promises for the future as did that of the automobile. From selling two cars a month many of the agencies grew large enough to dispose of as many thousand a week. State agents simply sat back and collected the money while local agents sold the cars, in many cases without going out of their sales rooms or making a single demonstration.

The days of big profits in automobiles have passed. The public in general, or at least those who can afford to, own cars, and never again will the harvest be as large as it was a few years ago. Intelligent and up-to-date dealers, garage men and even salesmen are beginning to realize that a new market is being opened which holds out more inducements than did that of the automobile. We speak of the truck and tractor trade, particularly the latter.

We feel safe in saying that within a very few months every farmer in the country will be investigating tractors. The Government is recommending the machines. All of the farming societies and granges are investigating it, and some bright morning the automobile dealer will be awakened by the clamor of customers at his door waiting for tractors.

To a certain extent tractors sell themselves. They are a highly necessary piece of the farm equipment. The hired man problem can only be solved by the use of the tractor and not only does the farm tractor make the farmer independent of labor troubles, but it also relieves the farmer of live stock worries. He need not fear that the tractor will pass away with the colic just when he needs it the most. He need not plant one-quarter of his farm in hay to feed the tractor with, for the tractor does not eat.

The tractor is just like a pre-payment gas meter. If you want it to work you furnish it with fuel and you don't have to furnish it with fuel unless you want it to work, whereas a horse requires food whether he is working or not.

Don't be a "back number," familiarize yourself with tractors and the tractor situation and in this way get your share of the commissions which the up-to-date dealers are bound to collect.

Do you know the measure of success which will satisfy you, or are you just drifting along day by day and week by week, reasonably satisfied to have three meals a day, pay your rent, and get nowhere in particular? Do you aim to be the head of the rat or the tail of a mouse? Are you satisfied to have anything short of the biggest business in your line in town? If you are, you better take a spring tonic—one that'll make you feel like a new "woman."

Many Tire Types Discontinued.

One of the things that has been accomplished by the present war, which seems to be fairly acceptable to the automobile trade in general, is the cutting down in the number of types of automobile tires manufactured. At the present time nearly 300 different types of tires are being made. It will almost seem that each motorist had his special type. This means that there is an unnecessary shelving of equipment and stock and the manufacturers are beginning to eliminate many of the types and sizes.

It is claimed that within two years all but nine types and sizes will have been discontinued. This step on the part of the manufacturers has been recommended by the Conservation Division and the War Industries Board.

MISSING NUMBERS—Our readers are requested to remember that we are always pleased to re-send numbers which have gone astray in the mails.

MAY THE WORLD BE ILLUMINED BY THE LIGHT OF LIBERTY

Why Should We Use a Capital Letter When Writing an "Improper" Noun Like germany?

IF one were to consult the dictionary he would find that the word capital is defined as being used to convey importance and for this reason we have the rule which tells us to use capital letters for words of importance. Again we have the rule which reads, "All proper nouns should begin with capital letters."

We contend that the word "germany" is of no importance and that it might be termed an "improper noun" rather than a proper noun. It follows therefore that the first letter should never be a capital. Let us reserve our capital letters for words like AMERICA, and not demean them by association with anything relating to the hun.

The kaiser Knows How the Yankees Fight Abroad, Show Him How We Help at Home

ONE hundred and forty-two years ago, our fathers declared themselves free. Upon the Fourth of July, the little country of America was born, and like an oak tree that little country grew until it is, upon its 142nd birthday, one of the biggest in the world.

Our ancestors established the United States of America upon the strong foundation that every man has an equal right with every other man. Many of them laid down their lives to prove that they were right. And it is to those brave men that we owe our present prosperity and freedom.

Eighty-eight years later more brave men had been sacrificed and more property destroyed. Our great nation was in grave danger, but, since the cause of Liberty and Justice was right, the storm spent itself and the sun shone once more. Those brave men killed in the Civil War, like those in the Revolution, were martyrs to the cause of Freedom.

To-day we are attacked by a merciless foe; a vandal who does not respect the laws of humanity, nor recognize the laws of God. Who fails to show mercy toward defenseless women and children and who massacres those helpless heroes who have been disabled by his cannon. A hun, who seems to have a compact with Beelzebub, and whose deeds might well cause Satan himself to hang his head in shame.

Can we countenance such inhuman actions? Has the sacrifice of our brave forefathers been made in vain? Can we attend to our own selfish interests before we staunch the wounds of bleeding France? Can we look our own daughters and wives in the eyes before we have avenged the wronged and helpless women of Belgium? Can we enter our homes and see our own children, without thinking of those youths and babies bayoneted by the barbarous german? Can we break bread at our meals without being choked by the thought of our countrymen starving in German prisons?

NEVER!

America must fight, UNITED we must work together. We must stand behind those brave boys whom we have sent over to France. We must do our part and keep them supplied with food, ammunition and courage. We must prove that even if we cannot fight at least we can help those who do fight. We must show the hun that God is NOT with him; that might is NOT right; that the old law of "survival of only the fittest" has no place in civilization—that WE ARE RIGHT.

We must show the kaiser that he cannot trespass upon the rights of others, that he cannot trample the weak under his feet, nor send a nation into bondage and slavery with impunity.

AMERICA must, and IS going to win the war. America is willing to sacrifice its all rather than be defeated. America and Liberty are synonymous, when Liberty is crushed by the iron fist, then America dies.

AMERICA has never been defeated—because America has always been in the right. Our boys in France ARE GOING TO WIN, because AMERICA IS STILL RIGHT. Stand behind our boys, do your part, they are giving their lives, you must furnish the money. The boys can shoot bullets only; your money will help kill autocracy; FIGHT FOR RIGHT AND FREEDOM.

Now Is the Time to Save, for the Stream of Easy Money Will Not Flow Forever

WAGES are high—never so high before, and still increasing. Many men are earning three or four times as much as they ever earned before, and too many of them are spending their money lavishly—almost recklessly—as though the flood would keep up forever.

After every freshet there comes a time when the turbulent stream subsides to quite modest proportions, or possibly dries up entirely, save a stagnant pool here and there. We may be sure that the money stream, now at high water mark, will some day subside also.

The moral of all this is that the man who is now earning big wages should save something for the day of drouth which is sure to come.

There is no better or safer way of saving than to buy United States War Thrift Stamps, regularly every week, as pay-day comes around. Don't put it off. Set aside a certain sum each week to invest in this way, and some day you will be glad that we gave you this advice.

A Fourth of July Bonfire in Honor of His Satanic Majesty, the kaiser

DURING the big parade in New York, on July 4th, in the heart of the big city, there was a bonfire in honor of the kaiser. We do not say this in sarcasm—but with the greatest earnestness. The person who furnished the fuel for the fire did his best to help the kaiser in his little way; and was to a certain extent successful. The man who built the fire was an automobile driver who stopped his car for ten minutes at the curb, without stopping the engine.

Now that bonfire was not an actual fire in the sense that it was a burning mass of wood; it was a bonfire of gasoline; a waste of that precious fluid which is so badly needed for our aeroplanes in France.

Every day there are hundreds of car owners who build bonfires for the kaiser; every day someone in this country helps the hun—DON'T HELP build it—help put it out.

There Is Still Time to Protest Against the Increase of Postage

OUR readers are advised that on July 1st the law establishing a system of zone postal rates went into effect, in connection with all periodical publications.

This law provides for eight zones radiating from the place of publication, with progressively higher rates in each zone. These rates will be raised, if the present law stands, each year for three years until increases over the old postage rate have been effected ranging from fifty to nine hundred per cent.

Of course it goes without saying that few periodical publications can stand any such excessive rates of postage, at present subscription rates. Some publications are probably rather disposed to worry along through the first year of the new law in the hope that the Congress to be elected in November next will see the injustice of the new law, and either repeal it or postpone its execution for a period long enough to enable them to make a far more comprehensive investigation of the second class postage question than has ever been made before.

Our candidates for re-election to the House of Representatives next fall, and also the new candidates, are likely to be far more amenable to reason, in connection with postage matters, while the campaign is going on than perhaps they will be after election. The people of this country who do not wish to pay more for their reading matter than they have been paying, should bring to bear upon all candidates the arguments with which, no doubt, most readers are familiar, against any increase in postage over and above the old rate of a cent a pound.

Unless the great reading public takes hold of this matter in earnest, all publications eventually will have to raise their subscription rates very considerably.

It is not too late for our readers who have not already written to the Congressman from their District and the two Senators from their State, to do so at once. They should enter a strong protest against the new law, and insist upon its repeal, or at least a postponement of its execution until after the war.

Is It Wise to Strangle the Industries of the Country by Ceasing to Spend?

THE sub-joined communication, which appeared in the New York Sun, June 22, 1918, written by M. T. R., is worthy of careful consideration by every reader of the Automobile Dealer and Repairer.

"It is necessary for the Government to have money, and a great deal of it, to win the war. If the industries of the country, to a considerable extent, are to be closed up as 'non-essential,' or their output greatly restricted, where is the money coming from to pay war taxes or buy Liberty Bonds?

"If you draw water from a lake continuously and permit little or none to flow into it, it only becomes a question of time when the lake will dry up.

"If you consider the United States a vast lake of money, it is manifest, if the Government keeps drawing it out in the form of war taxes and Liberty Bonds, that the time will come when the supply will run short—unless replenished, and the replenishment must come from the industries of the country in active operation.

"Classify them as 'non-essential,' and close them up, or reduce profits to a nominal point, and there is no big stream of money flowing into the great lake for future taxes and future loans.

"Take the automobile industry as an illustration. If this great business is forced to shut down because denied

Digitized by Google

steel and coal by the Government, several hundred thousand men and women will be deprived of the chance to earn a living, and there will be little or nothing in the way of profit to be taxed.

"The wise course would seem to be to keep all possible industries busy earning profits for the use of the Government in winning the war.

"It should be kept carefully in mind that property is not money—the Government doesn't want real estate or personal effects. It wants and must have money. Now, the only way to get it is to permit the industries of the country to go on making goods and selling them.

"The Civil War was a pretty big thing for those days, but there was never any attempt to throttle business, to deprive it of working materials, as seems to be contemplated now.

"There is far more need of keeping our industries going at full speed to-day than there was in Civil War days, because we have got not only to finance ourselves, but to a considerable extent to finance our Allies.

"Instead, therefore, of taking steps to dry up the sources of revenue, people should be encouraged to do all the business they can, and sell all the goods there is a demand for, in order that they may be in a position to pay war taxes and buy bonds. Nobody can pay taxes and buy bonds unless permitted to make profits."

Advertising Is One of the Largest Factors Making for Big Business

IN spite of the fact that Congress has condemned advertising by placing upon it an exorbitant tax, in the form of largely increased rates of postage, it still remains true that advertising is the greatest business building power in the world.

It should never be forgotten that during the discussion of the increased rate of postage on the advertising portion of second class publications, one intellligent Congressman proudly boasted that he had never read an advertisement in his life.

If that Congressman has not been ashamed of this confession, his constituents should be ashamed for him, and next fall leave him at home, to wallow in his ignorance. They should put a man in his place who is endowed with at least a modicum of business sense.

It has more than once happened that a big business has been built up by advertising, and when it was supposed to have acquired momentum enough to run itself, the advertising has been stopped, with the inevitable result that the business secured by advertising gradually dropped to a non-paying basis.

You cannot run a steam engine with the coal that was consumed in the furnace yesterday. You cannot run a business with the advertising done last week, last month, or last year. The public requires to be fed continuously with reasons for buying your product, or it will soon forget you and what you make. The old-fashioned notion that a good thing sells itself, may have worked, perhaps years ago, when there was no such thing as advertising, but it is hopelessly out of date to-day.

In imposing an exorbitant rate of postage on all periodicals, Congress has taken a step calculated to work great injury to the general business of the country. It is to be hoped that the Congressmen whom the people of the country will select next November to represent them will have become so well informed on the necessity for a low rate of postage on second class matter, for the benefit of the reading public, that the present confiscatory law will be repealed.

The Committee on Ways and Means (headed by Mr. Kitchin), gave the publishers several hearings, the latter part of June, but without apparently making the slightest impression upon Mr. Kitchin. He still seems to feel that it is necessary to wreck the publishing business of the country. He does not say that he is doing it because most of the publishing is done north of Mason and Dixon's line, but the impression is very strong that that is the reason for his advocacy of the unjust law which was passed at the last session of Congress. Mr. Kitchin's constituents would do well to subject him to an educational campaign.

The Usefulness of the Audit Bureau of Circulations and Its Importance

THE FOURTH ESTATE, of this city, does not believe in the Audit Bureau of Circulations, and thinks it has outlived its usefulness—if it ever had any. It regards this organization as an insult to the honest publishers of the country. It thinks the publishers should appoint their own auditing committee.

We cannot agree with these views. It is the honest publishers that need this Bureau to protect themselves from the publishers whose statements of circulation never can be relied upon.

We believe the Audit Bureau of Circulations is doing good work, and that it was never more useful than just now. Advertisers are entitled to know what they are getting for their money, and it is safe to say that they would have no confidence in an audit bureau maintained by the publishers themselves.

The Audit Bureau of Circulations is an independent organization, whose aim is to get at bottom facts regarding circulations. We believe they are perfectly fair in their treatment of publishers, and it is safe to say that no publisher with a more or less faked circulation can hope to receive endorsement at their hands. The Fourth Estate should join this organization.

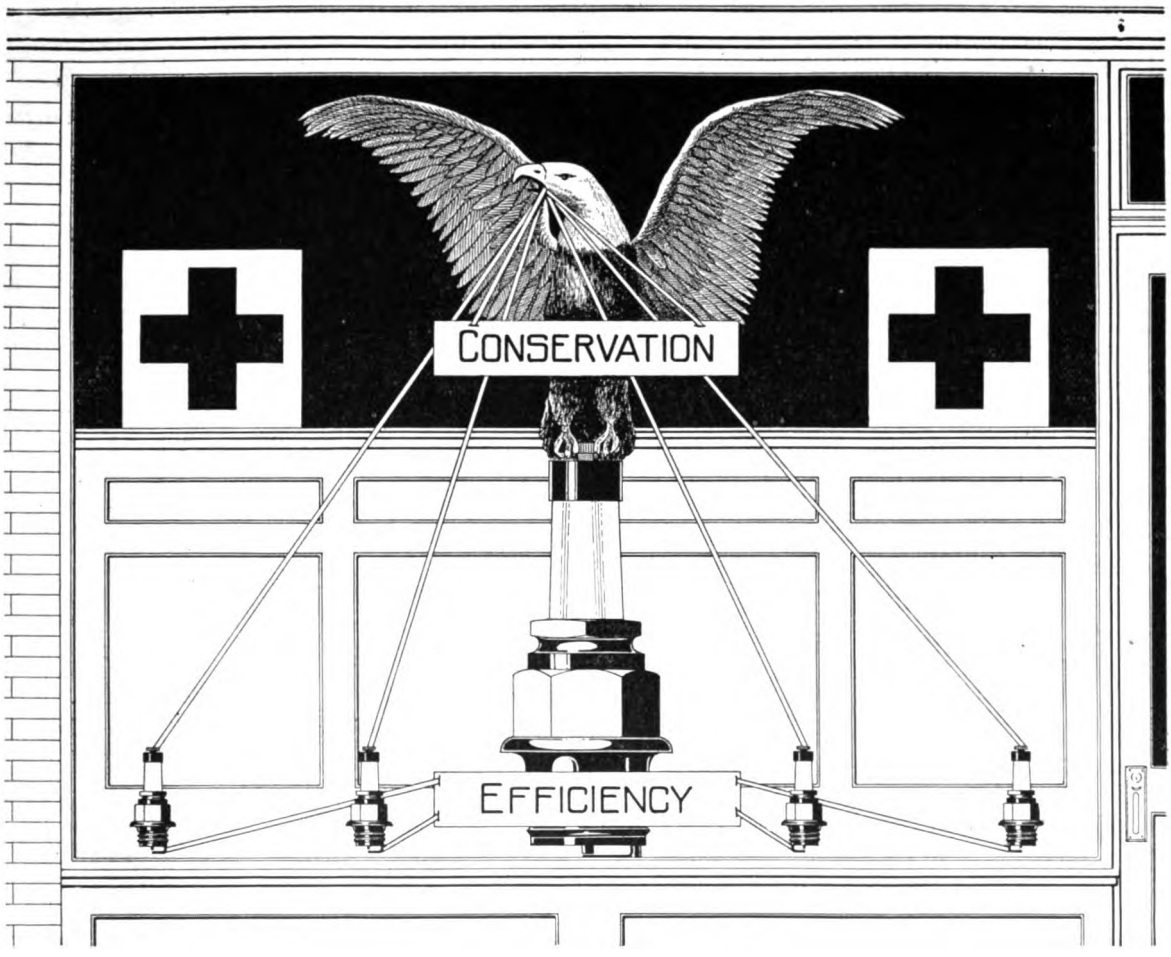
Trim Your Show Window So That It Will Attract Attention



Let Your Window Display Show Such a Patriotic Spirit That Every Person Who Passes Is Attracted To It and Gets the Impression That You, At Least, Are Doing Your Part In Winning the War

THE accessory salesman and dealer of today has one keynote upon which to base his show window exhibits and that is "Conservation." It follows necessarily that every window exhibit should be of a patriotic nature. Every true-hearted American is trying to do his part in saving the necessities of life in order that America may do her part in the war. For this reason the dealers should concentrate upon such accessories or devices, as in their opinion, make for efficiency and thus aid in the fight for conservation.

We all want to do our part to aid in winning the war and doubtless we all wrack our brains daily to find some way in which we can furnish our part of the muscle back of the solar plexus blow which will put the kaiser on his back until the end of the "count." We can all do it by being patriotic. We can each add our part to the enthusiasm which stirs the nation and cheers the boys who cross. Our enthusiasm will be reflected in our business and so our business must be, in itself, patriotic. Our show windows must all be emblems of our patriotic feeling.

What emblem stands for more than the American eagle? The one bird that can fly the highest, that is not afraid to look directly at the sun and is not afraid to attack any sort of an enemy. The American eagle stands for strength and air supremacy, and we surely want America to have both of these attributes.

The eagle illustrated may be cut from a large piece of pasteboard and painted with a brush and black ink. In his beak he carries the play card upon which is printed the war slogan of America, "Conservation," and leading to "conservation" are streamers from "efficiency." In our illustration we have shown spark plugs. A large pasteboard model of the spark plug to be ad-

Digitized by Google

vertised is cut out and mounted in the background, and above it and over all, the American eagle towers.

Only a few spark plugs should be shown, and these may be piled in groups upon various small stands at the several points shown in the drawing. Each one of these stands should be camouflaged to represent a spark plug itself. Too many exhibits in the window will only detract from the general appearance. In fact, one plug is enough to give the idea and bring the argument home to the beholder. As a background bunting or Red Cross flags may be used. The latter attract the most attention at the present time. In an early issue of this magazine we will publish an article showing the dealer how he may make use of our window display suggestions and how he may draw large emblems or ornaments himself with practically no practice. Be sure to save this particular page if you have a show window.

COMMENT ON THE ZONE LAW.

What One Well Known Postal Authority Has To Say Regarding the Change in the Second Class Postal Rate.

The following open letter was written to the Publishers' Advisory Board by Charles E. Hughes, who is one of the ablest men in the Republican national councils. The reader will doubtless recall that Mr. Hughes was the head of the Hughes Postal Commission which made a thorough investigation of the Postal Department.

By virtue of the months of painstaking investigation on the part of Mr. Hughes in these postal affairs, he is enabled to speak upon postal matters in condemnation of this destructive postal "zone" law with technical authority and a professional reputation of national recognition. Every subscriber should read Mr. Hughes' letter carefully, follow his arguments, and if convinced of their fairness, write to their congressmen and senators, asking for the prompt repeal of this destructive zone law.—(Editor.)

1262 New Hampshire Ave., Washington, D. C.
June 17, 1918.

Mr. Allen H. Richardson,
Publishers Advisory Board,
200 Fifth Ave., New York.

Dear Sir:

In answer to your letter, I beg to say:

I prefer not to accept a retainer to appear before legislative committees upon matters of general policy, as in such matters, if I have anything to say, I desire to speak only as a citizen.

I have no hesitation in saying that I regard the zone system of postal rates, for newspapers and periodicals, coming under the definition of second-class mail matter, as ill advised. The Commission on Second-Class Mail Matter (appointed in 1911), of which I was a member, considered this question and reported unanimously against the zone system. We said in that report:

> "The policy of zone rates was pursued in the earlier history of our post office and has been given up in favor of a uniform rate in view of the larger interest of the nation as a whole. It would seem to the Commission to be entirely impracticable to attempt to establish a system of zone rates for second-class matter. * * *
>
> "Progress in the post office, with respect both to economy in administration and to public convenience, leads away from a variety of differential charges to uniform rates and broad classifications."

In my judgment the zone system for second-class mail matter is unjust to the publisher and unjust to the public. It not only imposes upon the publisher the additional rates upon a sectional basis, but it makes necessary the added expense for the necessary zone classifications at a time when every economy in production and distribution is most important. It introduces a complicated postal system to the inconvenience of the publisher and public when there should be a constant effort towards greater simplicity. There is no more reason for a zone system of rates for newspapers and magazines than for letters.

Newspapers and magazines are admitted to the second-class postal rates on the well established policy of encouraging the dissemination of intelligence, but a zone system is a barrier to this dissemination. If it is important that newspapers and magazines should be circulated, it is equally important that there should not be sectional divisions to impede their general circulation through the entire country.

We are proud at this moment of our united purpose, but if we are to continue as a people to cherish united purposes and to maintain our essential unity as a nation we must foster the influences that promote unity. The greatest of these influences, perhaps, is the spread of intelligence diffused by newspapers and periodical literature. Abuses in connection with second-class mail matter will not be cured by a zone system of rates. That will hurt the good no less than the bad, and perhaps some of the best sort of periodical literature will be hit the hardest.

We do not wish to promote sectionalism, and "one country" means that in our correspondence and in the diffusion of necessary intelligence we should have a uniform postal rate for the entire country. The widest and freest interchange is the soundest public policy.

I hope that Congress will repeal the provision for the zone system which is decidedly a looking-backward and walking-backward measure.

Very sincerely yours,
(Signed) CHARLES E. HUGHES.

To give better service to a Packard owner than to a Ford owner is to lose the business of the Ford owner, who may be the better customer of the two.

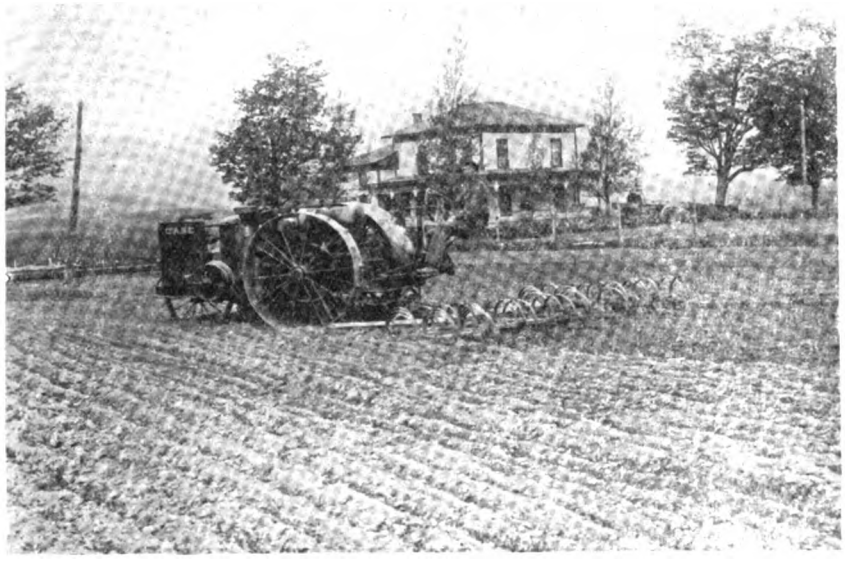
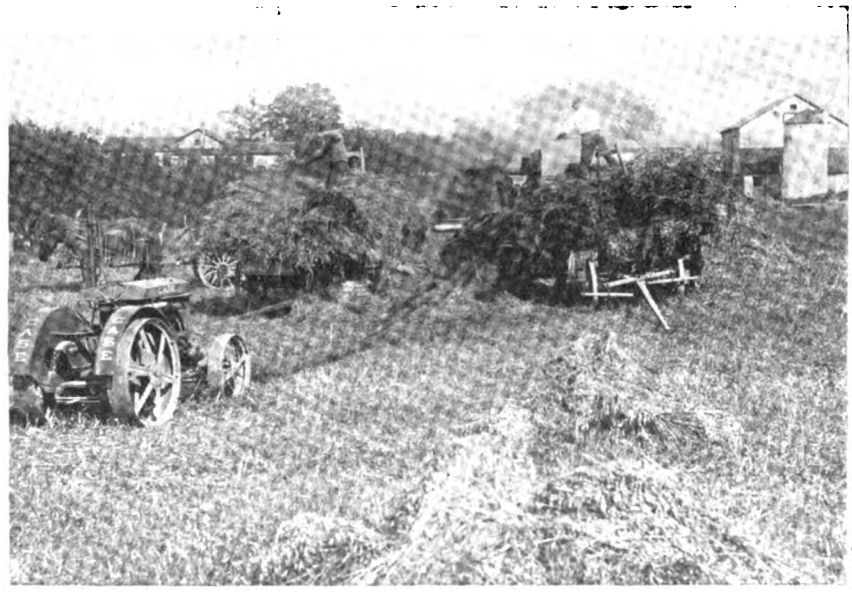
Farm Tractors Replace Many Men

Every Garageman and Dealer Should Begin to Realize That Man Power on the Farms Should Be Replaced by Machinery and Sell Tractors to the Farmers



BY W. O. MANN

"BOUGHT the Winters farm, have you?" said Farmer Halkett, his intelligent face lighting up with interest. "Well, I'm glad to hear someone knows a good thing when they see it. A fine farm, that one is. I'd like to have it myself, and maybe I would have taken it if I hadn't gone so strong on machinery and such like for this place. Suppose you'll be putting in a good deal of machinery yourself."



"Well, I've been thinking about that."

Farmer Halkett gazed reflectively at the horizon for a moment and took another look at his new neighbor before replying.

"Maybe it ain't my business to say so," he said slowly. "But if I was you I'd figure on running that place as much as you can by machinery or quitting before you start. Maybe you know where you can get plenty of help"—the newcomer shook his head—"but I don't. Unless you calculate to raise just a few little crops for the good of your health there's no use taking up farming round here doing your work with men and horses. The horse situation ain't so bad as it is in some localities, though it ain't what it used to be, but you can't get a man round here that can do a boy's work even and at that, there's so many wanting them that you can't depend

At the Left Is Shown the Case Model 10-20 Tractor, Doing the Work of Two Horses, Hauling a Spring Harrow in Heavy Soil. Such a Machine Is Often Used to Advantage in Performing Two Operations at One Time; Gang Plows Are Used and the Harrow Hitched on Behind. The Scope of the Tractor Is Almost Unlimited, It Replaces Many Horses, Is Tireless, and Eats Nothing Except When Used.

At the Right Is Illustrated a Case 9-18 Model B Tractor, Being Used for Thrashing. This Valuable Machine Helped Plow the Ground, Harrow It, Spread the Fertilizer, and Finally, When the Crop Was Ready to Harvest, Drew the Mowing Machine, Hauled It to the Thrasher, Where Its Power Drove That Machine. It Might Easily Be Used Throughout the Whole Year.

Digitized by Google

on 'em from one day to another. I've got a pretty sizeable little place here and I know everyone hereabouts and I'm willing to pay as much as anyone, and what men there is would as soon work for me as the next one. But I got my dose and I'm betting every dollar, cash and credit, on machinery farming.

"Yes, I've got a good three-plow tractor and even if horses and men was plenty I wouldn't go back. When I bought it the tractor people told me a good many things that I didn't swallow without a good deal of chewing. They told me if I did this and that, the machine would run from now till doomsday for the price of shoeing a couple of horses, and that I could run on gasoline or kerosene, and that I could plow ten acres in ten hours in any kind of soil, and a lot more.

"Well, says I to myself, I've been running a car for four years and I know a little bit about some things, and I counted a good deal on the tractor people being just a leetle mite too enthusiastic. You've got to take care of the machine, but you get it all back. It ain't in a machine to work all day at full power and then be satisfied with being left out in the rain without being looked over or considered at all. If it is any good it'll go the next day and the next, maybe; but the day when it won't go will come sooner than if you give it shelter and look things over before starting in again.

"I've got land here that old Betsy won't plow no ten acres of in a day, whatever the tractor people said. But I've got land that she will, and I've done it, too. Let me tell you that's darn good working. You put horses on that and they'll take three or four days to do it. The tractor'll make 2½ miles an hour with three plows where a team'll make less'n two—a good deal less—with one bottom.

"Then you've got to consider your feed. You feed your tractor with stuff that comes in bar'ls, but you've got to feed your horses with what you grow on your own land, and maybe you know how much land it takes to feed a horse! No? Well, on a hundred-acre farm all worked by horses you can just nick out twenty good acres to feed the animals. What do you think of that, neighbor? Oh, yes, maybe the gas and oil and repairs and things'll cost as much as the feed you raise on them twenty acres, but there's several things to think about right there. First off you can raise crops that'll bring a sight more'n feed's worth from them twenty acres, and that's enough to settle the whole question. Then there's no trouble getting good prices for good horses, and that goes toward paying for the tractor and other machinery. And then your wages ain't nearly so high at the end of the week. Oh, I tell you that labor question is a peach! 'Course you can't run a tractor without a man, but you can't work horses enough to do the tractor's share of work without a heap more men, and the more men you have these days the more trouble you have, and that's gospel truth.

"Another thing I hadn't much faith in was this here business of running with kerosene. Henry Alloways over on the other side of the mountain got a tractor that they told him 'd run on kerosene, and it done it all right too. Run for a week steady and Henry was the tickledest man in the country when he figured up what he'd saved. But the machine began to act queer, and it got tired and wouldn't pull her three bottoms through the bad spots without coaxing, and finally she just naturally quit. Henry learned a lot right then, and I helped him so I learned something too. The cylinder head, all in one piece, come off nice and easy, and, by gosh, I wish you'd seen the mess inside. Everything was so stuck up with carbon that it was a holy sight. And a funny thing was that there was more oil in the crankcase than Henry'd ever put in, but it was thin and weak-looking. We didn't know then, but we found out since that the kerosene had a smart little trick of workin' down past the pistons into the bottom and mixing the oil, where it didn't do no good at all. I guess a little more and everything that had ought to be oiled would have been chawed to pieces.

"I had a talk with a tractor man that knew I wasn't at all hopeful as a customer, and he told me that tractors that'll burn kerosene is as plentiful as blackberries, but tractors that'll burn it all up, and leave no carbon, and not spoil the oil, and keep on doing that, are almost as scarce as applejack at a tea-meetin', and that's going some. There's a few, he says, but dang few. I don't know whether my machine'll do it or not, in spite of the earnestness of the people I bought it from, who don't mean any harm, I guess, but just take someone's word for it. But I'm just as sharp to save as any other man, and I've tried mixing kerosene with my gas and watching for bad effects. I'm using fifty-fifty now, and I can't see but what she works as good as on virgin gas. There's just a little mite more carbon, but not enough to count or to do any harm in one season, and I can't see any difference in the oil in the crankcase. But I'm not going to go any further just yet. I believe my old Betsy would be just what Henry's machine done on straight coal-oil.

"This night-work stunt ain't so bad, neighbor. I see they're fixin' up tractors now with electric lights and all that, and I guess it's a good stunt if they can make the fixins so's they'll stand the pounding of farm work. There's none on mine, but I tried night work just the same. On Beeman's place next to mine they lost two horses and couldn't get any more in time, and two of his men went off to Portville one Saturday night and got soused and started to do up the town. That got 'em thirty days each and Beeman nearly went crazy. So I fixed up to plow his land nights, making two days out of one. I took one of the acetylene headlights off my car and put it and the gas tank on the tractor, and we made a real good job. It surprised me a little that after we got used to it we could do as much work in a night as we could in a day. My son Tom and I took turns, each working half the night and sleeping the other half. It wasn't much fun, but I figured that it was worth

Digitized by Google

while because Beeman's a good fellow and it saved him from an out-and-out losing season, maybe, and anyway he paid me a fair price and was mighty glad to do it. He considers himself beholden to me, and he's in line for some tractor man to work on, I guess. Ought to be, anyhow.

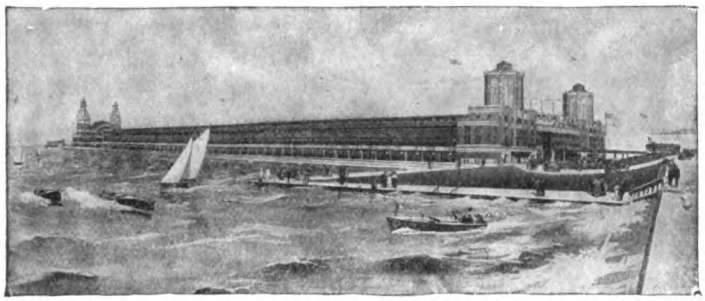
"Well, if you're interested come over some evening and we'll talk over it some more. I could talk straight on without stoppin' if I didn't have something else to do. Maybe I can save you from some experience.

"Say, neighbor, if you're going to be in the city you might do me a favor. Just inquire round a little and see if there's anything to be had in the way of a little motor plow for truck garden work—one of them machines that we used to hear so much about that'd do the work of one horse. I don't hear anything about 'em any more, and I did think there was a good deal in 'em, if they ever got 'em just right. I asked the man that sold me my tractor, but he said they hadn't worked out well and there was no use bothering with them. That don't sound reasonable to me, and I know farmers that would buy 'em quick if they was all right and not too high. If it's no trouble, just ask about it and let me know sometime —oh, any time at all. Good day."

The Gigantic Exhibition in Chicago

A Show of Tractors and Trucks That Bids Fair To Eclipse By Far Anything of Its Kind Ever Staged Before, in the World

DURING the week of September 14th to 21st, upon the Municipal Pier at Chicago, Ill., will be staged one of the greatest shows in the world. We speak of the Second Annual Exhibit of Trucks, Tractors and Accessories, directed by the Automotive and Accessories Exposition, Inc. All of the farmers of the Middle West are looking forward with great interest to this exhibit, for the very reason that they will be able to inspect and make comparisons of the many forms of trucks and tractors which are now being sold.



Never before has there been such a collection of tractors as there will be at this exhibit. The space devoted to tractor exhibits is approximately 42,000 sq. ft., while an equal allotment of space is made for truck exhibits. These two machines are keynotes to the nation's salvation in food production and distribution. Never before in the history of the world has there been such a call for conservation, and so the interest in trucks and tractors will be very intense at this time. There are more exhibitors already signed up for this great exposition than the total number at the 1917 show which was held in the Coliseum, yet there are still two

Digitized by Google

months left before the show opens. It is also interesting to note that the space already contracted for is much greater than the total floor space of the Coliseum.

The first and second days, Saturday and Sunday, will

The Municipal Pier at Chicago.

be "curiosity seeker days." Monday and Tuesday the hardware men of the country will attend a conference, because hardware dealers everywhere are getting in line to handle automobile accessories and fittings for trucks and tractors. Some of them already have agencies for this type of machinery, others carry these lines along with their regular lines of hardware.

Wednesday will be Illinois day, when farmers from that state will have the right of way to all parts of the magnificent pier except to quarters of the U. S. Navy Training School for Ensigns. Thursday and Friday the thresher men of Illinois, Wisconsin, Iowa, Indiana and Ohio will hold a convention in the auditorium nearly a mile from the shore as interests of the exposition committee.

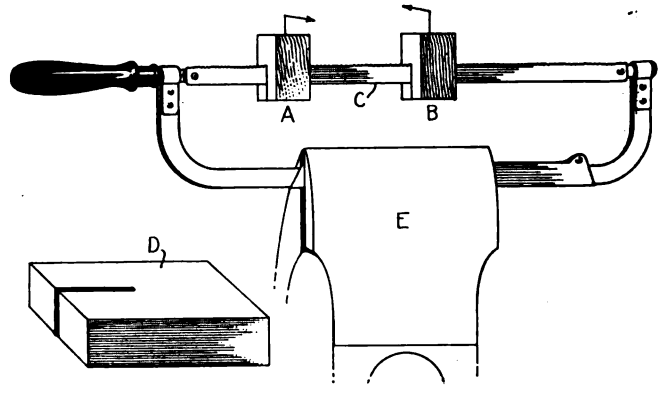
The space devoted to the Motor Vehicle Publishing Company is 9-A and our representative will be very glad to greet our friends and subscribers at this booth.

The various illustrations herewith show the tremendous amount of floor space as well as the appearance of the pier itself. The pier is divided into two sections. At one side is provided an enclosed parking space large enough to house 1,200 automobiles. At the west end of the pier is the tractor section. The middle section is devoted to truck exhibits and the east end to display of accessories. The first two exhibits are divided by a single aisle through the middle, while the accessories are shown in four rows of booths, two at the center and one at each side separated by two aisles. One may walk from one end of the pier to the other and be able to see every exhibit without walking back and forth.

Do you give yourself a reasonable time for relaxation —the kind of relaxation which is really recreation— which will send you back to your work more eager for it and more fit to accomplish bigger things? Take your wife along with you, and your boys and girls if you have any old enough to enjoy good music, an amusing picture or an inspiring play. Don't get to be so hide-bound that all you can see is dollars and cents, and ledgers and day books, and profit and loss!

STRAIGHTENING A HACK SAW.

Some Machinists Say That a Hacksaw Cannot Be Straightened, But It Can Be, With a Little Care and Patience.



A METAL cutting or hack saw as it is usually termed is made of the best and hardest steel obtainable. The teeth are glass hard and will break if hammered in the least. The body of the saw, back of the teeth, is not so brittle, in many cases, as the teeth and the saw may be "kinked" by carelessness.

To many repairmen, a kinked hacksaw really means a broken one, for they had rather throw the blade into the scrap pile than to repair it. In the days when hacksaw blades were expensive, the machinist used the utmost care when cutting with the saw in order to prevent kinking or saw breakage.

Once a saw is bent, it is useless for it will stick in the metal or snap into pieces; then again, one cannot cut upon a straight line with a bent saw blade, even if the blade is still usable.

Where the bend is long, the blade can be straightened with the fingers, that is, if one is careful not to put too much strain upon it at once. But if the saw is kinked, the finger method means a broken blade and so herewith is shown an easy method.

Prepare two pieces of hardwood as shown at D by cutting slits in one end with a new hacksaw blade of the same thickness as the one to be repaired. Place these over the bent blade as shown at A and B and clamp the saw holder into the vise as shown at E. Be sure that the blade C is drawn as tightly as possible in the frame.

Illustrating Method of Straightening Hack Saw Blades.

By moving the two blocks back and forth on the blade, small kinks will be straightened.

If the kinks are deep, the blocks should be brought together upon each side of the bend and by working the blocks back and forth, with a slight twist each time, the blade will be gradually straightened. Patience is necessary, above all other things, or the saw will be broken. Straighten the saw a little at a time without trying to remove the bend all at once.

Two Ideas for the Owner or Repair Man

If You Are a Car Owner, You Should Have These Two Tools, and If You Are a Repair Man They Are Indispensable, Because They Will Save Time and Money

VALVES and compression are two items that go hand in hand, when one falls the other goes down also and the engine begins to burn a hole in the pocketbook of the owner. Not long ago I dropped into a garage where the repairmen followed the old Southern custom and "guessed so" when repair work was to be done. I watched one of the mechanics interview a proud Ford car owner who was not satisfied with the car mileage and who did not care to take his exercise mornings in the shape of cranking the engine for half an hour.

The repairman reached over to the throttle and opened it wide until the engine figuratively "ran a race with itself and came out ahead"; then he shut off the throttle entirely until the engine sputtered along on two cylinders. After ten minutes of this sort of "testing" the engine was stopped and the mechanic resorted to the hand-crank, lifting the engine over each compression stroke in order until he had tried all of the cylinders.

"Compression," said the mechanic briefly, then, in order not to appear too certain, he said, "I guess your trouble is in the second and third cylinders; they don't seem to have as much compression as the other two."

I "Guess" He Was Right.

What an intelligent mechanic that repairman was; he had raced the engine and worked upon it ten whole minutes and then only "guessed" what the trouble "might" be. He didn't know what the trouble really was, until he had pulled the engine all down, then he found that his "guess" was correct.

Suppose that you were troubled with a pain in your abdomen and consulted a physician. After listening to your symptoms the doctor might say: "I guess you have appendicitis, but we will have to operate before we can be sure." I doubt very much that you would let that particular doctor perform the operation, before you were sure of the diagnosis. Also I doubt if any doctor would make a diagnosis without using mechanical means to verify the trouble. And so it should be with the repairman, he should "guess" at nothing and should provide himself with suitable tools and instruments.

A Compression Indicator.

The compression in an engine can be measured, much the same as the pressure in a tire or an air tank, in pounds per square inch. Compression varies in different engines; it should not be less than 40 pounds per square inch and is seldom over 125 pounds per square inch. Each car has a normal pressure point, just as the human body has a normal blood pressure point, and the owner should find out just what this pressure should be in his car.

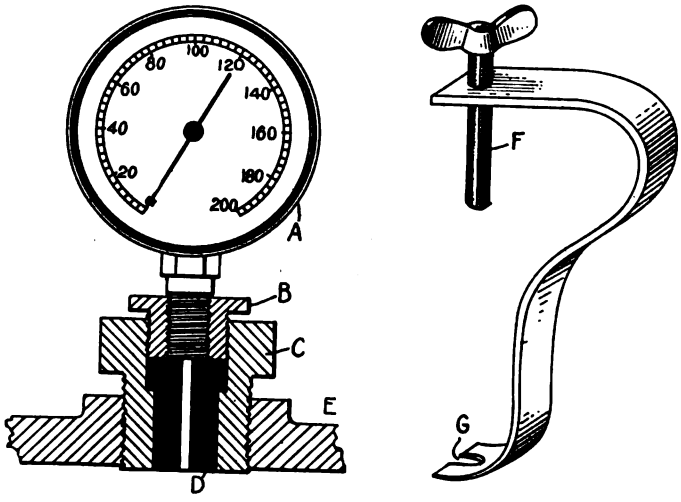
Obtain a pressure gauge, most any sort of a gauge will do if it is calibrated high enough to indicate the highest pressure in the particular engine to be tested. The one shown in the diagram herewith indicates to 200 pounds and is large enough for any engine. A gauge from an old air tank, a Prest-o-Lite gas tank, or a tire gauge will do.

After having removed the porcelain from an old spark plug, have the packing retaining nut B threaded for the gauge, then screw the nut B back into the base of the spark plug C. Put a wooden plug into the nut B, in place of the gauge, and after having cleaned the inside of the plug and nut with a file, smear it over with a soldering paste or acid. Then fill the plug with soft solder as shown at D.

This solder prevents any air leakage past the nut B. Bore the hole through the center of the solder and after removing the wood plug insert the gauge, being sure to screw it into the nut tightly. The compression can then be tested by removing a spark plug and inserting the device in place of it.

A Second Method.

The question might come up, "I can't obtain a gauge such as shown without paying out considerable money." No, you can't now, but you may be able to obtain a second-hand steam gauge. But if you only have a tire gauge of the vertical kind that will indicate up to 100 pounds pressure, don't despair. You can use this just as well as a round one.



In place of the gauge shown in our drawing, place a tire valve. Cut the valve off close to the bottom and remove the insides. You can put it into the old spark plug and pour the melted solder around it, if you don't want to have the nut B threaded inside. Any time you want to use the device, screw the tire gauge upon the tire valve and put the whole into the spark plug hole. Next time you take your car to the garage, show the garageman this article and ask him how he tests compression.

A Handy Valve Tool.

On the market at the present time there are, perhaps, some hundreds of different kinds of valve tools; some of them are so small that they fall through the holes in the bottom of the tool-kit; others so large that they can

Digitized by Google

be used only in conjunction with a block and tackle or by a muscular man. Some of the devices will do anything but repair the engine, others will do nothing except lift the springs, and though the one illustrated herewith falls into the latter class, it is well worth considering if one owns a Packard, a King, or other V type engine.

Two Handy Devices for the Car Owner or the Garage Man.

Some V type engine valves are hard to reach and the ordinary lever type of spring lifter cannot be put into place without removing all of the engine fittings, a waste of time.

The second figure of the illustration herewith gives one an idea as to how a valve lifter may be made that will conform to the shape of the valve side of the engine block. Only a piece of strap iron and a long bolt fitted with a wing nut are necessary. The strap iron should be about one inch in width, 3/16 of an inch in thickness, and long enough to loop about one inch above the top of the engine block. The end G should be forged down to a point so that it can be slipped beneath a spring easily.

With this device, one need not remove the intake or exhaust manifolds, and all of the valves may be removed very quickly. If work is being done on one valve only, the device may be left in place, compressing the spring, and the valve returned as soon as it is repaired.

PROPER LUBRICATION.

A Mixture of Graphite and Grease Is Often a Better Lubricant Than Plain Grease.

TO the motorist who realizes that twenty-five per cent. of the power delivered by his engine is lost in friction, the question of lubrication is one of paramount importance. Grease cups are gone over, oil reservoirs are watched carefully, bearings are inspected regularly and frequently cleaned.

Care in the selection of lubricants is important to him, too, as he realizes that each bearing, gear or spring requires its particular kind of lubricant. Engineers who are experts in the line of automobile lubrication point out that plain oils and greases squeeze out under great pressure and heat. When flake graphite is mixed in, however, the oil or grease serves as a vehicle to carry the graphite to all parts of the bearing or part to be lubricated. The flakes of graphite adhere to the surface, fill all the minute irregularities and form a tough, durable film which prevents metallic contact. The graphite does not squeeze out.

A MOUNTAIN OF RUBBER.

How the Loyal Residents of Cincinnati Hit the kaiser With a Mountain Made of Rubber Junk.

Members of the Cincinnati Automobile Dealers Association developed a successful project in connection with the recent Red Cross drive by appealing to all citizens to dump their old tires, inner tubes and other rubber accessories on Fountain Square to build "Mt. Rubber." The response was generous, as will be seen by the accompanying photograph of "Mt. Rubber."

The picture shows H. K. Shockley, general manager of the Cincinnati Automobile Dealers Association on the pyramid. Equally generous was the bidding for the old rubber, more than $2,000 being realized, all of which

The Mountain of Rubber.

was turned over to the Red Cross Fund by W. G. Welbon, treasurer of the Cincinnati Automobile Dealers Association. One of the unusual contributions to the dealers' collection was a truck, which the owner presented in its entirety because he "could not get off the tires." It brought $5 in the sale.

Thrust Washers for a Ford.

2465

From R. G. Kimball, New Hampshire.—Kindly advise me by mail how I may overcome any possible trouble I may have due to the change I have made as stated below. I have changed my gear ratio from 3.7 to 1, to 2¾ to 1 (Ford car), and had to turn down one thrust washer to about half its original size due to having a larger pinion gear. I find that the thrust washer has worn, causing a grinding noise when turning corners.

I built up the opposite thrust washer to correspond. What I would like to know is if there is any possible way of substituting different washers to overcome the wear. The thrust washer that was turned down is about half its original size. Kindly advise me as soon as possible as I would like to know if there is any danger of stripping my gears running the car as it is.

Reply.—We would advise you to replace the present fibre washer with a single washer made of Tobin bronze. This should be made specially for your car and can be obtained at any small machine shop. In applying or replacing washers in the Ford rear axle, it is always advisable to so arrange the washers that two steel ones do not come together. In every case steel or iron should rust against bronze or fibre. In your case the bronze washer is most necessary or you will have a lot of trouble with the axle. Practically all of your trouble will be eliminated by the use of a singe bronze washer of the required thickness.

Binding Pistons.

2466

From Frank P. Kutschemeuter, Texas.—When the motor in my 1918 Ford is cold the compression is strong and very springy and seems to be the same in all cylinders, when I try it with the crank; but as soon as the engine becomes hot the pistons stick. That is, they don't stick too tightly, but they feel tight and have no more of that nice springy feeling. I am now using light oil instead of medium thinking that that would overcome the tightness, but it doesn't. I have also looked into the cylinders and found the walls slightly oily and smooth. Just how oily the walls should be, I do not know, and would appreciate your answer. The motor seems to lack proper power which I suppose is due to that same tightness, although I get good mileage (about 25 miles per gallon) and believe I could beat this if I could remedy that tightness.

Reply.—The engine is evidently receiving sufficient lubrication or the cylinder walls would appear dry. The walls should be covered with a very even film of oil at all times. Your trouble is probably due to the fact that there is not sufficient clearance between the pistons and the cylinders or because there is not sufficient clearance between the ends of the piston rings.

When the engine is heated the pistons and the rings fully expand. If the clearance is not great enough they will tighten in the cylinders and cause excessive friction. The clearance to be left between the ends of the rings when cold is about .015 of an inch. The diameter of the piston should be .005 of an inch smaller than the bore of the cylinder.

Stripped Differential Gears.

2467

From P. Kliphouse, New Jersey.—I have a Baby Grand Chevrolet 1916. It was running fine, but a few weeks ago it started a grinding sound when running under 20 miles per hour, and this week when I put the lever in reverse, it would not back up and ripped the tread off the right hand rear tire. I have just put in a new bevel gear and the rear end is O. K. The starter will not start the car when it is cold.

Reply.—We would advise you to examine the differential again. Probably when you put in the new bevel gear you made some mistake in assembling the differential and either left a tool or a bolt in the housing.

Adjusting Current Regulator.

2468

From A. F. Sandow, Kansas.—I have a Simms-Huff System on a 1916 Maxwell the generator of which charges too high. It will go up to 30 amperes. Where is the trouble?

Reply.—Your trouble is probably due to the fact that the spring on the regulating device is too strong and requires too much current to break the contact. This device is arranged so that when the current reaches a point from 15 to 20 amperes, the electro magneto draws away the armature and breaks the contact of the direct line and makes contact through a certain amount of resistance. If you find that the charging current after the armature contact has broken in the circuit is 30 amperes, then the reason for your trouble is that the resistance is not great enough. If this is the case we should advise you to send the regulator to the factory for repairs.

A Unique Trouble.

2469

From B. Harrington, Maryland.—We have a Model 37 Hudson four cylinder, which is equipped with a Delco electric system. Every time we use the car the points in the distributor corrode and we have to file same to get the car to run the next day after using. In other words, we have to file the points every morning to start the car, as they get so corroded every time we use it. The points are new and we cannot understand why the trouble

Digitized by Google

is caused, so would ask you to be so kind as to give us some information on this so that we may try to remedy the trouble.

Reply.—We doubt if we have ever heard of such a peculiar case as yours and your trouble with the breaker points in a Delco distributor, and we can explain it in but one way.

From your letter-head, we should assume that you are situated near salt water and as you pack oysters, and perhaps other salt water food, your file or emery cloth has been covered with salt water moisture or oyster broth.

Both salt water and the liquid from oysters is very corrosive, and once it gets into the timer it will continue to corrode the points until they are destroyed. We should advise you to remove the breaker box from the machine and soak it over night in kerosene oil. Wipe it off carefully with a cotton cloth. Be sure to do this work away from your packing house or you will have the same trouble all of the time. You must replace the breaker points with new. Do not file with a rusty file. Dress them off only with a clean piece of emery cloth which has not been near your packing house.

If you follow these directions, being careful to keep your hands free from salt water or oyster moisture, you will have no trouble with the breaker points.

NEW AND INTERESTING THINGS IN MOTORDOM

"Yankee" Ratchet Breast Drill.

No matter how much the automobile manufacturer prides himself on the simple disposition of the parts of his car, the compact construction naturally renders many parts difficult of access; while taking down parts of a car's construction to make repairs is one of the bugbears of garage service. Nevertheless, drilling holes under ordinary conditions raises this necessity most frequently. And inasmuch as with today's scarcity of mechanical help, it is important that repair work be done with the utmost dispatch, the tool that gets to the job and does the work most quickly and easily is in biggest demand.

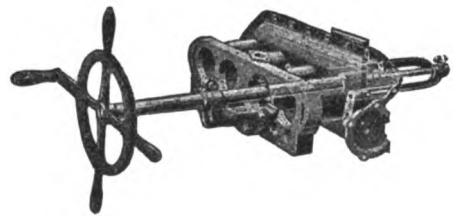
Of the many features in the "Yankee," the double Ratchet is the most unique. It drives the drill on both forward and backward movements of the crank, even the slightest. Thus, there is no idle movement or lost motion.

It is surprising to how many working conditions this highly specialized tool can be adapted. With it the motor mechanic can handle most any drilling job, and it also saves materially in the number of drilling tools required, making his kit less cumbersome and less expensive.

"Yankee" Breast and Hand Drills are made in 14 different sizes and styles from the 10½-inch Hand Drill No. 1530 (which has all five adjustments) to the powerful Breast Drills Nos. 555 and 1555, capable of holding drills up to ½-inch diameter. Manufactured by North Bros. Mfg. Co., Philadelphia.

Jenkins Vulcan Springs.

It is claimed by those who know, that the average spring breakage for all automobiles amounts to one for each car annually. Notwithstanding this high average, however, the car owner does not apprehend spring breakage and when this mishap occurs the car may be put out of commission for a week or more until the proper spring is secured from the factory.



Mr. T. B. Jenkins, President of the Jenkins Vulcan Spring Co., Richmond, Indiana, conceived a new idea some few years ago and put a plan into effect. By this plan dealers and garage owners are furnished an assortment of springs in various sizes and types, duplicates of those used on the most popular cars, and, together with this assortment, a special rack. The manufacturers specialize on service, and advertise extensively that there is a spring in every town for every car. It follows, therefore, that the car owner who knows of this will go to the dealer who handles the Jenkins Springs. Our readers are requested to write the manufacturers for full details of this plan.

Heiser Improved Cylinder Reborer.

The repair man of today realizes that with so many old machines on the market there is a constant call for the reboring of cylinders, but work of this sort cannot be accomplished satisfactorily upon an ordinary lathe. The Heiser Improved Cylinder Reboring tool manufactured by the Heiser Special Tool Co., Department A, Kingston, Mo., is well worth the investigation of our readers. The device is shown in our illustration and is exceedingly simple to operate.

It is self centering, in that it is adjusted to the unworn portion of the cylinder. It is designed to clamp upon the top of removable head cylinders or so arranged that it may be clamped upon the bottom of removable engine blocks and operated by anyone, even though they had no previous experience.

The cutting tools are easily kept in repair and are said to be self-sharpening. Though the whole machine weighs but forty-five pounds, it is very strong and

Heiser Improved Cylinder Reborer

does the work without chattering. The device does not require machine power, since it is operated entirely by hand, so that it is applicable even to the smallest garage or even the car owner may use it to advantage.

Storm Light Weight Pistons.

Because of the curtailment of production and the extreme shortage of new cars, proper shop equipment for the rebuilding of old ones is far more important than ever before. The brisk demand for shop tools, equipment, extra parts, etc., indicate that the repair men in general are alive to this situation and are grasping the opportunity for making increased profits.

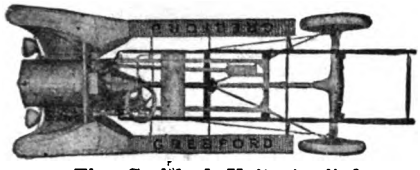
It is important that the motor cylinders and pistons should be given proper attention. Leaky cylinders and heavy unbalanced pistons cause more trouble and waste more fuel than all other defects combined. It is obviously useless to repair other parts and neglect these important items. The motor cannot truthfully be said to be rebuilt unless the cylinders and pistons have been put into proper condition.

The Storm Manufacturing Company, in addition to manufacturing Cylinder Reboring Machines and other motor repair equipment, have established a most extensive piston service for the purpose of providing special light weight pistons of the highest quality for any make of motor, and furnish them in any desired oversize.

When the great number of different makes and models of pistons now in use are taken into consideration, some idea of the magnitude of this service may be had. At the present time core boxes for over 1,000 different styles and sizes are used and about an equal number of patterns, and new ones are being added as required. These are all numbered and careful record kept for immediate reference. This insures the greatest possible promptness in filling orders with the least possible chance of error or delay.

The Storm Light Weight Pistons are made of a special close-grained semi-steel metal. They are made as light as is practical, often as much as 50 per cent lighter than the original pistons furnished by the manufacturer. Yoke-shaped reinforcements are used to provide ample strength combined with lightness. This light weight is a most desirable feature, reducing vibration, stress and wear. They are finished to size with extreme accuracy, can be fitted closely and, therefore, are very durable. A motor provided with these pistons will give the longest and most economical service. They should not be classed with the ordinary oversize pistons so often made by small foundries using the original piston as a core box, making them very heavy and undesirable.

No doubt many of our readers will avail themselves of this opportunity. The manufacturer's address is Storm Manufacturing Company, Thompson, Iowa.



Replacement Parts.

The United Motors Service, Inc., of Detroit, Michigan, announces that they have a complete circuit of service in Delco, Klaxon, Remy electrical replacement parts throughout the country, in various cities. At these various branches one may obtain genuine parts for repairs or replacements on Delco, Klaxon and Remy electrical equipment, as well as secure expert factory trained workmen to make the necessary repairs and adjustments on any of these units.

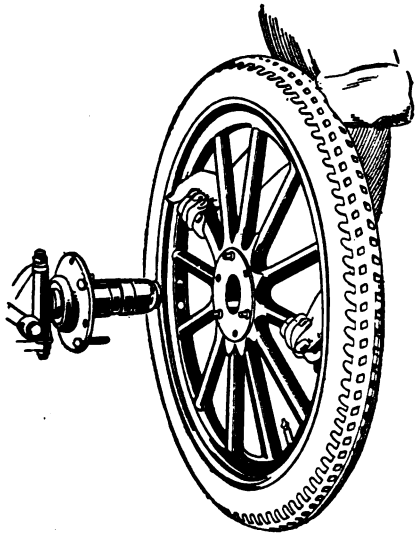
Digitized by Google

The Grebford Unit.

This year will see the conversion of many Ford cars into trucks and every car owner who intends to fit his Ford car with a light truck or delivery body should investigate the Grebford unit manufactured by the Greb Co., 197 State Street, Boston,

The Grebford Unit Applied

Mass. This extension will lengthen the Ford wheel base to as much as 136 inches and comes in a number of sizes.



In putting the Grebford unit into place the regular Ford rear axle, together with the drive shaft, is removed and the sides of the Ford frame are drilled for bolts which fasten the extension frame into place. A special length of driving shaft, together with a universal joint and ball housing, is furnished and the regular Ford rear axle carried out to the length of the wheel base desired. For carrying the rear spring an extra heavy stayrod is used, together with spring saddle and necessary fittings. The whole extension is complete with necessary dressed rods, bolts, nuts, washers, etc., making a complete unit.

E-Z Way Demountable Wheel.

The J. P. Gorman Co., Inc., 382 Canal Street, New York, are manufacturing a product which, if used, places the Ford in the class with many high priced cars in one respect. It relieves the Ford owner of tire changes on the road.

The E-Z Way Demountable Wheels and Wheel Carrier, as the product is known, consists of a complete set of four Ford flanges and special collars, together with bolts, nuts, and other necessary fittings. The flanges are installed in place of the regular Ford wheel hubs. The regular Ford wheel hubs are discarded and the Ford wheels are fitted with the special inside flanges and outside plates. When this installation has been completed three nuts retain the wheel to the demountable hub.

In making a tire change these three nuts are removed and the wheel may be immediately slipped from its place. With the

E-Z Way Demountable Wheel

equipment is furnished a spare wheel together with a wheel carrier which may be mounted at the running board. The illustration herewith shows how the wheel is applied.

Norwesco Twelve-Twenty.

By perfecting a non-freeze solution that the motorist can test with an ordinary Battery Hydrometer, the Northwestern Chemical Co., Marietta, Ohio, feels that it has supplied a need which has been long felt by every motorist who has ever driven a car in freezing weather.

Norwesco "Twelve-Twenty" is the name of this radically different liquid. The easy-to-test feature is the "big seller" back of it, but running close second in importance is the fact that "Twelve-Twenty" requires no mixing or dissolving—it comes ready to use right out of the can.

Because it can so readily be tested, "Twelve-Twenty" does away with all guess work in connection with radiator protection, says the Norwesco Co. No longer need the motorist wonder whether his non-freeze is strong enough every time a cold snap comes. If he has followed the Norwesco suggestions to test his radiator solution at regular intervals, he knows that his radiator is absolutely safe down to twenty degrees below zero—the point at which the Norwesco solution freezes.

The solution is made with a specific gravity of 1220, hence its name. If evaporation or leakage cause changes in the solution the hydrometer discloses that fact and a weak solution may then be restored to standard strength by the addition of "Twelve-Twenty." If the test shows undue strength, dilution with water corrects the defects. Thus a motorist may test his non-freeze solution as he does his tires or his battery and the close check he can keep on the solution should go a long way toward reducing last winter's record of more than 100,000 frozen radiators.

There has been much complaint by motorists over the tendency of the commonly used anti-freezing solutions to "find" leaks. This fault is said to be totally lacking in "Twelve-Twenty." On the contrary, the tendency of "Twelve-Twenty" is to keep the cooling system fluid-tight. Its boiling point is twelve degrees higher than that of water, so it evaporates very slowly. In this way it overcomes one of the chief objections to alcohol mixtures. The claim is made also that it warms the motor more quickly than water, thus reducing the "popping" and enabling the engine to settle sooner into a smooth, easy motion.

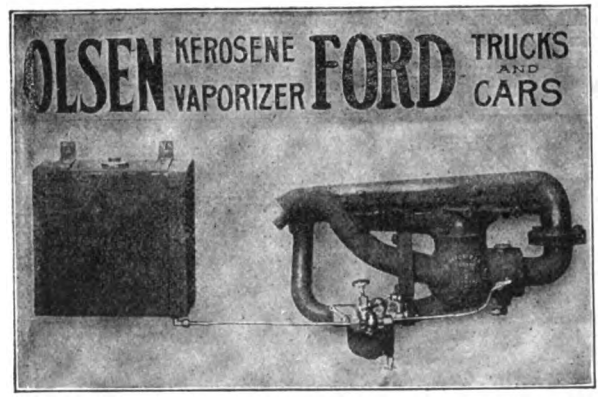
A powerful campaign of advertising in the *Saturday Evening Post* and other publications is expected to put Norwesco "Twelve-Twenty" into the "big seller" class along with Se-ment-ol, the radiator ce-

Norwesco 12-20 Container

ment, with a million users; Shalex the radiator cleaner, and the other well-known products of the Norwesco "Chemically Correct" Line.

The Masters Gasoline Meter.

Something unique in the line of automobile accessories is being manufactured by the Irvin W. Masters, Dept. 3, Muncie, Indiana, and known as the Masters Gasoline Meter. The device is unique in that it measures the amount of gasoline going



into the carburetor. It is mounted upon the dashboard or instrument board and is constantly before the driver. As it gives a record of the amount of gasoline consumed the driver can, at a glance, see just what mileage he is getting.

If the mileage is poor the driver's attention is called to it and he is, therefore, able to make the necessary adjustments to the carburetor. To a certain extent it prevents engine trouble by indicating trouble before the cause affects the engine. It is to the gasoline system what the ammeter is to the electrical system and the autoist of today realizes how indispensable the ammeter is. It necessarily follows, therefore, that a gasoline meter should be just as valuable.

Olsen Kerosene Vaporizer.

One patriotic act which every Ford car owner can do is to use kerosene in place of gasoline and so leave more of the latter fuel for use in aeroplane engines and abroad. Not only is it patriotic, but much cheaper to utilize this lower grade fuel, yet it is said that an engine may be operated just as well and even more efficiently on kerosene.

The United States Vaporizer Co., 214 State Street, Boston, Mass., market a device known as the Olsen kerosene vaporizer. It is easy to install and any car owner may fit his car for kerosene in two or three hours. The outfit consists of a special vaporizer manifold and hot-air attachment for the regular Ford carburetor. In addition to this is furnished an auxiliary gasoline tank for starting. In starting the engine a three-way cock is turned and gasoline used until the engine is thoroughly warmed. Then the cock is again

shut off, shutting off the gasoline and admitting kerosene only.

The manufacturers claim that the engine will operate just as satisfactorily on kerosene as upon gasoline, and are willing to substantiate their statement by a thirty-day guarantee. If the purchaser is not satisfied he may return the device and receive his money back within thirty days.

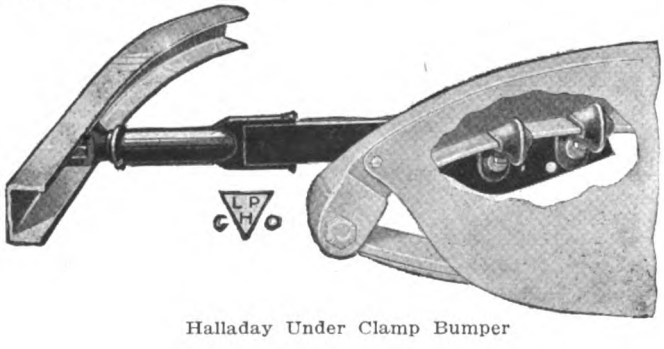
The Gasograph.

If you have ever been caught ten miles from "nowhere" in your automobile with no gasoline in the tank you will appreciate the value of the product called the Gasograph, manufactured by the New Standard Adding Machine Company, 3701 Forest Park Blvd., St. Louis, Mo. This device

The Gasograph Indicator



is attachable to all cars using either vacuum or gravity feed.

The indicator illustrated is attached to the instrument board and shows how much gasoline there is remaining in the tank. The tank is connected with the indicator by a length of tubing. The device operates on a very simple and scientific principle. The pressure created by the weight of the gasoline in an auxiliary cylinder at the bottom of the tank is carried through the tubing to the instrument on the dash. There are no springs, corks, floats or mechanical contrivances to get out of order and the manufacturers claim that it will operate satisfactorily at all times.

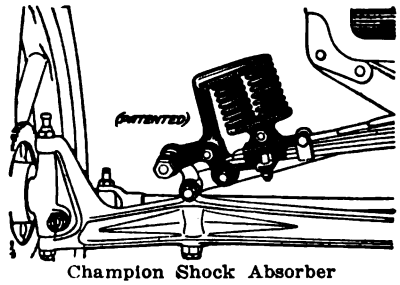
Halladay Under Clamp Bumper.

This is the latest of the Halladay Bumpers and has been designed to meet the ever growing demand for a practically universal bumper. It is secured to the underside of the frame extension by means of two clamps of such design that they instantly conform with any angle or curve of the frame. The side bars are heavy bar steel with the spring carriers of the rigid bar types or the bar clamp of the spring bar pattern securely riveted thereto.

The shape of the side arms is such that clearance is provided for frame rivets and similar parts and the bumper bar is carried in a position low enough to afford thorough protection to the car.

Halladay Under Clamp Bumper

This bumper is supplied with all the various styles and sizes of Halladay bars—all the bars of rigid type being supported by shock-absorbing springs and the spring bar supported by a rigid clamp, as shown in the illustration.



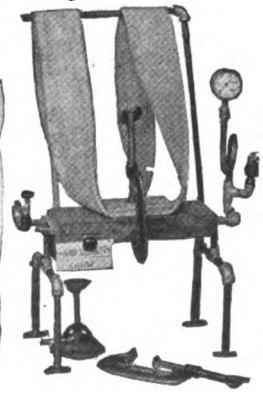
For further details write the L. P. Halladay Co., Streator, Ill.

Champion Shock Absorber.

The average motorist fails to realize the damage that is done to his car by road shocks and ordinary vibration. If he did he would be more careful of his automobile springs and if the springs did not function properly, equip the car with shock absorbers.

No matter how perfect a pair of springs may be, they do not absorb all road shocks or side sway, and so every motorist should investigate the advisability of installing a set of shock absorbers. The Champion shock absorbers are interesting because of the fact that they are designed upon the correct principle, that is to absorb by spring cushion effect rather than add to the bounce of the car. For this reason there is practically no recoil to the car springs or the car.

The shock absorbers are designed primarily for the Ford car and may be attached very easily with practically no alteration to the machine. A main casting fits in place of the regular Ford spring toggle while a smaller casting is bolted to the spring itself. Between the main and small casting are applied two large coil springs. A clever lever arrangement equalizes the shocks while the expansion of one spring in the absorber is equalized by that in the other.



Champion Shock Absorber

For further details write the Champion Shock Absorber Sales Co., Inc., 918 North Senate Avenue, Indianapolis, Ind.

The Handy Vulcanizer.

Every garage or repair shop should be equipped to mend tires. There is probably no branch of the trade which brings in such high returns as tire repair work. The first cost of the vulcanizer is practically the only one and the repair man can spend his spare time working upon tubes and shoes.

Illustrated herewith is a vulcanizer manufactured by the Handy Vulcanizer Co., 4470 Broadway, Chicago, Ill. This vulcanizer is designed to operate upon steam heat, the pressure being generated by a gas

The Handy Vulcanizer

burner beneath the water tank. The vulcanizer shown in the cut is designed especially for repairing tubes. It is light in weight and very compact. The price is low and the equipment should be investigated by every up-to-date repair man.

The H. C. Fuel Strainer.

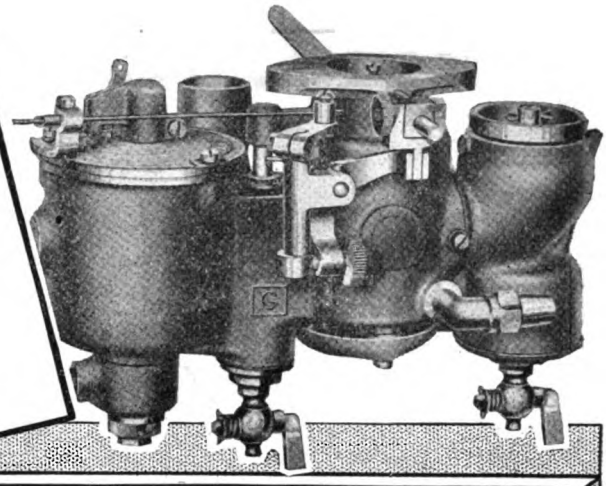
There is nothing that causes more annoyance than dirt or water in gasoline. Dirtless and waterless fuel will give increased mileage, more power and a smoother running engine with a minimum amount of carbon than will dirty gasoline.

The H. C. Fuel Strainer

A device which is designed to prevent both dirt and water from reaching the carburetor and so clogging up the small passages is made by the Holtzer Cabot Co., 135 Armory Street, Rocxbury, Mass. It consists of a large metal body, a cap and a fine mesh strainer through which all of the gasoline must pass. In passing through this strainer water and dirt are separated from the fuel and drops to the bottom of the strainer.

To clean it one need but open the plug at the bottom and the dirt and water drop out. The strainer is furnished complete and anyone can install it in a very short time. Suitable connections are furnished and no changes are necessary in the present automobile gasoline system. It may be used on gravity pressure or vacuum feed systems.

The Panvar Liquid.



In these days when everybody wants his dollar to go farthest, the owner of an automobile is especially interested in those things which add to the life of a car or else decrease the cost of operation. One of the important items is careful preserving of the finish of a car, particularly the leather and upholstery.

If the finish and upholstery is dull and shabby, the value of the car seems to be lessened. It may be compared to a man who wears a shabby suit of clothes. He gives a bad impression. If the paint has not been chipped off, or the upholstery and leather worn too greatly, Panvar will renew the original finish. In fact, often times a finish produced with Panvar is better than the original. Panvar is not a varnish nor a polish. It is simply a renewer and resurfacer where the paint is otherwise in good condition. It may be applied with any soft white brush and dries in a few hours' time. Anyone interested in this product should get samples and further information from the Panvar Co., 603 Bulletin Bldg., Philadelphia, Pa.

New England Directory.

Every automobile dealer, garage owner or repair man who is contemplating the circulation of literature through New England should write the Sampson & Murdock Co., 246 Summer Street, Boston, Mass., for the New England Business Directory. The price is exceedingly low notwithstanding the fact that more than 300,000 names of business firms in New England are in the directory.

W.S.S.

WAR SAVINGS STAMPS
ISSUED BY THE
UNITED STATES
GOVERNMENT

In Our Country's Service

Saving Is Serving

A ***RAYFIELD CARBURETOR*** enables the owner to conserve from 20 to 50 per cent more gasoline than any other make. The gas you save will *drive the tanks* "over there." The money saved can be used to *buy War Savings Stamps* "over here."

RAYFIELD CARBURETORS

"THE WORLD'S BEST"

Rayfield Special for Ford Cars

Thousands of Ford owners are buying the Rayfield Carburetor because it gives them an easier starting car, greater flexibility and more fuel economy. The Ford car owner gets better all around motor performance from a Rayfield Carburetor because it is especially designed to add economical efficiency to Ford cars.

The New Rayfield Thermostat

Thousands of cars are equipped with this new device. The Thermostat insures proper temperature for best motor performance under all weather conditions. Quickly installed as a permanent part of the circulating system, it makes *any automobile* and all year 'round car. Adapted for any make of motor. Write today.

Rayfield Carburetors and Thermostats Are Sold by Dealers and Service Stations Everywhere

YOUR CAR IS ONLY AS GOOD AS YOUR CARBURETOR

Price with Auxiliary Air Control $10.00

If You Want POWER, SERVICE and ECONOMY

Use A

D. & B. CARBURETOR

Designed, Developed and Perfected for the Ford motor exclusively.

Springless, Simple, and Efficient.

Gasoline vapor measured and mixed with mechanical accuracy and nothing left to springs or other unstable construction.

Insures a smooth running, powerful motor, maximum mileage and absolute freedom from carburetor troubles of any kind.

No change in controls or manifolds.

Easily installed by anyone.

Sold by most live dealers. If yours does not carry the D. & B., write us direct with your check for the total cost, and we will ship prepaid on receipt of order.

MANUFACTURED BY

O. C. HARRINGTON CO., 341-345 N. Crawford Ave., CHICAGO, ILL.

Mid-West Distributors: GRAY-HEATH CO., 1440 Michigan Ave., Chicago, Ill.

New England Distributors: THE POST & LESTER CO., 112 Allyn St., Hartford, Conn.

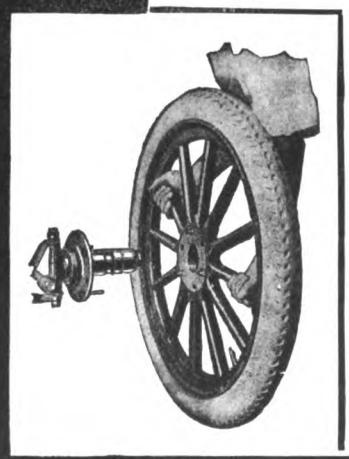
THE PRICE OF VICTORY AND THE COST OF DEFEAT

No matter what it costs in money, we shall find it cheaper to win than lose the war.

The germans are the most ruthless tax collectors on earth. They expect America to pay for the war. Their newspapers talk of an indemnity of $25,000,000,000. When they have the power the prussian autocrats have no difficulty in collecting.

Brussels, after many fines and taxes, was punished by a fine of 5,000,000 francs "on account of the attack made upon a german soldier by Ryckere, one of its police officials."

Luneville was fined 650,000 francs because of an alleged attack by some inhabitants.



Cardinal Mercier complains that 500,000,000 francs were imposed on impoverished Belgium by December of the first year. In November, 1915, the prussians decreed that the contribution be increased to 40,000,000 francs a month from bled-white Belgium. Later it was raised to 50,000,000 francs monthly.

These instances may be increased indefinitely. At last the Belgian men were carried away into slavery. Later this was done in Poland.

It will be far cheaper to pay now than to pay when germany sets the price.

IT'S A GOOD PROPOSITION FOR ANYONE AT $12.50

Demountable Wheels and Wheel Carriers for Ford Cars

E-Z WAY Demountable Wheels are simpler, better and much cheaper than Demountable rims. Your old wheels are used and none of the Ford parts are changed. New inside flanges and collar stud bolts are simply installed. No machine work necessary.

Price, $12.50

The Outfit complete, including 4 wheel changes with inside flanges, extra spare Ford wheel, spare wheel carrier and socket wrench.

Truck-Fords, $10

To make a tire change simply remove three nuts on the wheel flange, slide off the wheel with the damaged tire, put on the spare wheel in its place and away you go in 5 minutes with E-Z Way Demountable Wheels.

CORK INSERT

For FORD cars and for BIG cars

for trucks and passenger cars

WE want to make clear the fact that Cork Insert Linings are made ***for every car that runs.***

For Ford cars there's the Cork Insert Transmission Lining. Sold in boxes containing set of three, all ready for installing.

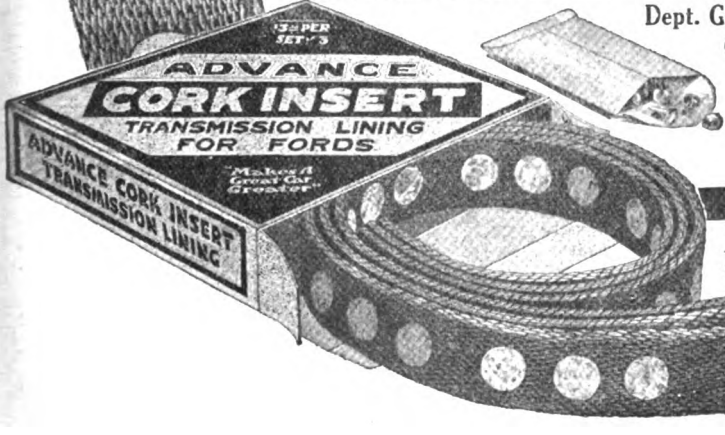
Then there's Cork Insert Brake Lining for all the other cars, sold by the foot from the roll. Made in two thicknesses and thirteen widths.

At the left is pictured a piece of Cork Insert Transmission Lining for Fords. Below it is shown the package.

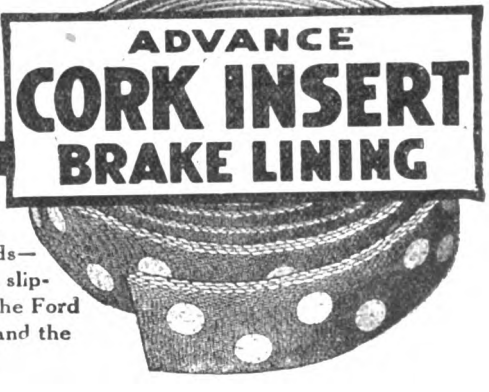
At the right is pictured a piece of Cork Insert Brake Lining used for cars other than Fords, while below is represented a roll of the lining.

Stops grab, slip, chatter, in Ford transmission

Cork Insert Transmission Lining for Fords stops the grabbing and slipping—vibration and chattering. Requires less pressure on the pedal. Makes the Ford Brake BRAKE. Saves the Ford rear end. Outwears several sets of ordinary linings.



Oil, slip, grease proof—insures a safe brake



CORK INSERT BRAKE LINING has the highest co-efficient of friction obtainable in a brake lining. It produces smoother, more positive braking action. Less pressure is needed on the pedal. It is unaffected by oil or grease. No grab, slip, SQUEAK. Gives longer wear and better control of brakes.

DEALERS: The Cork Insert line is a wonderful money maker for the trade. It supplies a staple need with products that serve the user better and mean more profitable business for the dealer.

Any jobber will supply you with Cork Insert. Ask the next jobber's salesman who comes in about it.

ADVANCE AUTOMOBILE ACCESSORIES CORPORATION
Dept. G-5, 56 E. Randolph Street
Chicago, Ill.

Another big seller is Cork Insert Fan Belts for Fords—they stop all slipping—keep the Ford fan fanning and the engine cool.

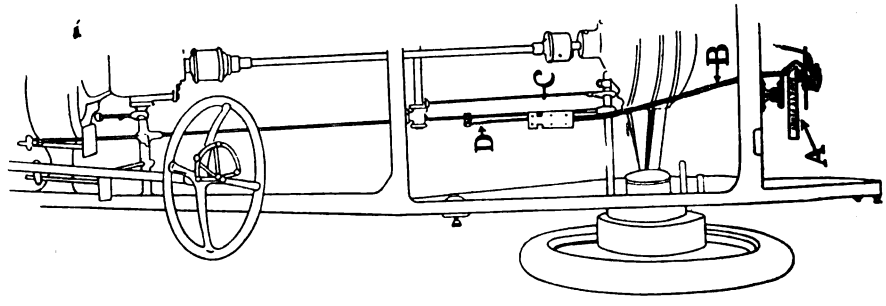
B. F. S. Valve Grinder.

Every up-to-date garage man realizes that the operation of valve grinding occupies considerable time if the old hand method is used. Such work may be accomplished in one-quarter of the time or less if an e'ectric valve grinder is used. Such a machine is manufactured by the B. F. S. Manufacturing Co., 54 Hermon street, Worcester, Mass. This machine

B. F. S. Valve Grinder

may be obtained to operate upon practically any type of electric illuminating current and the results obtained by the use of this machine are considered better than those obtained by hand grinding. We would advise all of our garage readers to correspond with the manufacturers and write them for full details and prices on the B. F. S. Valve Grinder.

Crum Wiley Instant Gun Primer.



We receive requests frequently from our subscribers, asking why their gasoline engines do not start readily and we always answer by saying that it is entirely a problem of vaporization. They must furnish the engine with properly vaporized gas or it will not start.

If your engine is hard to start you should investigate the C-W Instant Gun Primer, manufactured by the Crum Wiley Mfg. Co., Peru, Indiana. This device is essentially an atomizing pump and attaches to the dashboard and takes its supply of gasoline from the regular fuel line. It is so arranged that when the pump is operated, a fully vaporized spray of gasoline is forced into the cylinders. The manufacturers claim that if the device is used an engine may be started even in the coldest weather.

Comer Auto Signal.

Have you ever gone motoring and had the feeling that you were a capable driver but that you were not sure that the trip could be accomplished without an accident because of some other driver's mistake? Often times you stop your car suddenly and the fellow in the back drives directly into you just because he does not know that you intend to stop.

The Comer Auto Signal, manufactured by the Wonder Sales Company, 616 Hippodrome Bldg., Cleveland, Ohio, is a device designed to obviate any danger of this sort. This device is operated by pressure upon the brake pedal. At the back of the car is mounted a semiphore, which under ordinary conditions is hidden behind the number plate. When the brake pedal is applied, this semiphore comes into view. The signal is positive and cannot be misunderstood because the arm is marked with the word "stop." At night this word is electric lighted. The illumination is had only when the semiphore is in the "stop" position. The driver does not have to think of the signal, for the reason that it is entirely automatic, and with this device one can be sure that his trip will not be marred by rear-end collision.

Showing how the Comer Auto-Stop Signal is attached and how it operates in connection with the brake pedal.

A—Comer Auto Stop Signal.
B—Flexible Cable.
C—Lever Attachment.
D—Wire and Clamp.

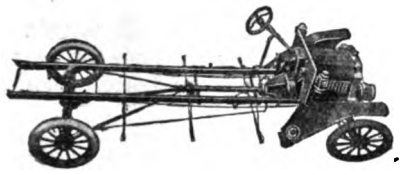
Important New Motor Books.

Laird & Lee, Inc., Chicago, announce that they have now in press the 1918-1919 edition of "The Modern Motor Car," by Harold P. Manly. It will be issued in one compact volume of 536 pages, large 12mo, with 225 illustrations from detail drawings and photographs and a 24-page alphabetical index, durably bound in flexible keratol, with round corners and colored edges. The revisions and additions bring this standard work up to the very minute, making it a complete, practical and handy reference cyclopedia on all matters connected with the care, repair and upkeep of every type of automobile, old and new.

The same firm have also in hand for immediate publication: "The Farm Tractor —Its Care and Repair," by Wallace B. Blood. This will be uniform in style and size with "The Modern Motor Car," and at the same price, $2.00, postpaid.

Gasoline Hose Literature.

The Bureau of Standards, Department of Commerce of the United States Government, recently issued a report in which they commented upon the leaks in valve and piping used for conveying gasoline. Anyone interested in the saving of gasoline, the prevention of leaks or the reduction of fire hazard should write for the illustrated literature just issued by the Metal Hose and Tubing Co., Raymond & Tillary Streets, Brooklyn, New York. This literature will be sent free of charge to anyone sending their name and address.



Detroit Weatherproof Top.

The Sharrer Patent Top Co., 239 West 56th Street, New York, N. Y., are offering an interesting proposition in the shape of an all-around detachable top for a number of well-known automobiles. These tops are made of the best materials in a strong and workmanlike manner and are carefully designed with flexible doors and windows which slide into the roof when not in use. Our readers who are interested in obtaining a stylish top for their car should write the manufacturers, telling them the make of their passenger car.

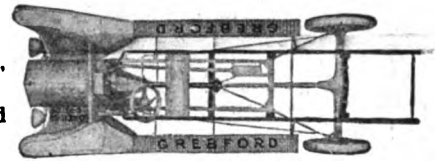
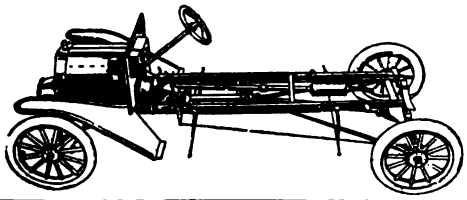
GREB

AUTOMOBILE ACCESSORIES AND GARAGE TOOLS

P. B. B. ASSEMBLY FOR FORDS



Extends any Ford Chassis to 124, 130 or 136 inch wheel base, thus making a 1500 lb. to 2000 lb. delivery truck that will stand up to the wear and tear of every-day usage in a masterly manner.



Shaft is totally enclosed. The equipment is complete down to the last screw and washer, and accompanied by explicit instructions.

GREBFORD EXTENSION FOR FORDS

The Grebford *Unit* will lengthen Ford cars in an hour's time. Wheel bases 112, 115, 118, 124, 130 and 136 inches. Capacity 1,000 to 1,800 lbs.

It is not necessary to even cut or disturb the Ford frame. Shipped all assembled and ready to be instantly installed. Write us today for full particulars.

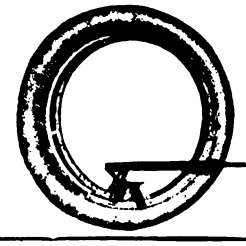
GREB EXTENSION FOR FORDS

Old Ford cars, as well as new, can be quickly converted into first class, efficient, durable, 1000 lb. delivery trucks. Will lengthen to 115 or 130 inch wheel base. Extensions are of riveted channel iron. We furnish with the equipment all bolts, cap screws, lock washers, rivets, nuts, etc., together with full instructions.

BEACH AUTOMATIC GRIP PULLER

Quick, Strong, Durable, Efficient and Simple. Can be locked in any desired position. Positive grip, cannot unhook, and adjusts to work instantly. Three long arms are also furnished, (12 in. from bell crank to hook which open to 18 in.) Flat end screw. Gilt edge guarantee of highest possible quality and insures extreme satisfaction to the users.

GRIP PULLER JUNIOR SIZE



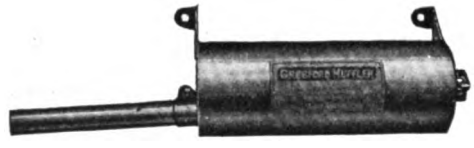
Designed for all types of motors. Will remove timing, magneto and pump shaft gears and couplings. An efficient tool for all small work. Furnished complete with two sets of arms.

The unfailing popular approval of these Grip Pullers is because their gallantry of conduct in action is sure.

BEACH UNIVERSAL RIM TOOL

It opens the rim ¼ inch. It raises one end two inches and carries it over and by the other four inches, thereby contracting the rim. It swings by center and the spring of the rim holds and locks it in the contracted position, so that the tire may be removed. After the tire has been repaired and replaced simply reverse the operation and the rim is forced back to its correct position. It actually contracts and holds the rim, then expands and locks it in its true position in one operation without removing or changing the position of the clamps. About thirty seconds are required to attach and all the hard work is avoided. Proves its value the first time used.

GREBLOX



A Good Solder Cement

Mends radiator and pipe leaks, seals cracks and mends spark plugs, mends tears in upholstery and tops, stops short circuits in starting and lighting systems, restricts head-light glare and windshield rattles, secures loosening nuts and screws.

It holds forever metals, minerals, glass, cloth, wood, paper, etc.

A TOOL BOX NECESSITY. Write for full particulars about all our products.

GREBFORD MUFFLER

This muffler is self adjusting without loss of power at all speeds of the motor. The "just as good" kind have taken a back seat—Grebford Muffler has won all along the line. Be SURE—Look for our Trade Mark. Write for details.

THE GREB COMPANY, 197 State Street, **Boston, Mass.**

SAVES 30 to 50% GASOLINE ON ALL MOTORS

SUNDERMAN
Vacuum Carburetor

GIVES GREAT INCREASE IN POWER AND FLEXIBILITY

Every Mail Brings an Unsolicited Testimonial from User or Dealer

BELOW we print a few testimonials, selected at random from letters that have come to us within the last few weeks. As is true of all commendatory letters we have printed in these pages, these enthusiastic comments have come entirely unsolicited. They speak for themselves better than ordinary advertising copy—so judge for yourself.

Increases Mileage 121 Per Cent

Jan. 15, 1918.

Sunderman Corporation: Was getting about 12 miles on a gallon of gas and my Ford car would balk on hills. Installed one of your carburetors and the results were wonderful. I can make most any hill on high, made forty miles on a gallon and a half of gas. It has paid for itself several times its cost. If I couldn't get another I would consider it priceless.—William J. Buehler, Scarsdale, N. Y.

"They Are Wonders"

May 23, 1918.

Sunderman Corporation: Carburetors sent by Parcel Post received. They are wonders. Kindly rush four more Parcel Post, C. O. D., Ford size.—R. W. Lynn, New Enterprise, Pa.

Makes Good in Gruelling Test

May 18, 1918.

Sunderman Corporation: I have put your carburetor to some very severe tests; want to tell you that I am more than pleased with it. I just returned from a trip in the northern part of the State, and there is plenty of sand there, enough to try any make of machine, but with your carburetor the little Ford acted as though it enjoyed that kind of travel, and had plenty of kick all the time.—W. H. Fisher, 1940 Frances Ave., Grand Rapids, Mich.

Repeat Order the Best Testimonial

May 20, 1918.

Sunderman Corporation: On Jan. 28th I bought a Sunderman carburetor. We like it so well I want you to send me two by express for a Ford car, check enclosed.—J. C. Powell, Fort Meade Cycle Shop, Fort Meade, Florida.

Approval From an Expert

June 1, 1918.

Sunderman Corporation: A customer of ours, Mr. Bauer, placed his order for one of the Model "BB" Carburetors, which order is enclosed. He has been using a Model "F" Sunderman Carburetor on his Ford car for over two years, and is much pleased with it. Mr. Bauer states he has received as high service as thirty miles per gal. on his Ford with a Sunderman, and averages at all times 27 miles. He is chief chemist of the largest independent starch factory in the world, and made the test when the gasoline was cool in the tank of his car, thereby not taking advantage of expansion. He recently made a run from Chicago to Cedar Rapids, a distance of approximately 260 miles, and he states that the carburetor performed very nicely during the whole run. We are merely making this report as we assume you are pleased to receive this information.—Newell Construction & Mchy. Co., Cedar Rapids, Iowa.

Makes Good in Shifting Sand

March 7, 1918.

Sunderman Corporation: I gave the Sunderman carburetor a more severe test than you ever thought of. A few miles out from Live Oak is a nine-mile stretch of sand road (by sand I mean loose dry sand), that auto drivers avoid by driving about five miles around. After the carburetor was adjusted I took my car over that road. I went in at one end in high gear and came out at the other end without changing gears, and without a miss in the engine, and that is what I call "going some." With the old carburetor the car would not perform stunts of that kind. The drivers I have spoken to about it say it sounds "fishy," as they claim it is impossible to drive that road in high. The carburetor is absolutely O. K., and if anyone from this section of the country makes inquiries refer them to me, and I will demonstrate to them what it will do.—A. E. Wrigglesworth, Live Oak, Fla.

Stops Spark Plug Fouling

May 23, 1918.

Sunderman Corporation: Please ship me by special delivery parcel post another Ford Sunderman carburetor. You might like to know what I did with the carburetor I received from you last Tuesday. It was put to a 1916 Ford, which would not run six miles without cleaning one and two spark plugs. I have run this car now about a hundred and fifty miles and have not had a skip from the motor. It really seems unbelievable, and before I announce my find to the trade would like to try a carburetor on a 1915.—Arthur L. Ryan, G. M. C. Trucks, Webster, Mass.

Over 61 Per Cent Increased Mileage

March 6, 1918.

Sunderman Corporation: Send me by express at once C. O. D. one more of your Sunderman Carburetors for Overland car No. 75. 1916. I put the Sunderman Carburetor on my Ford car you sent me on ten days' trial, and I am getting 29 miles on one gallon of gas on the state roads where I was only getting 16 to 18 miles on the other carburetor. I am well pleased.—Fred W. Ward, Wellsville, N. Y.

"Surpasses All Expectations"

April 25, 1918.

Sunderman Corporation: Words are beyond me to express my thanks and appreciation of the Sunderman Carburetor. I must say it surpasses all expectations, and when I first saw it I could hardly believe such a small instrument could run my Stoddard-Dayton, but she certainly moves and keeps on moving with a saving of gasoline.—R. A. Watson, 420 E. 153d St., Bronx, N. Y.

34 Miles on One Gallon

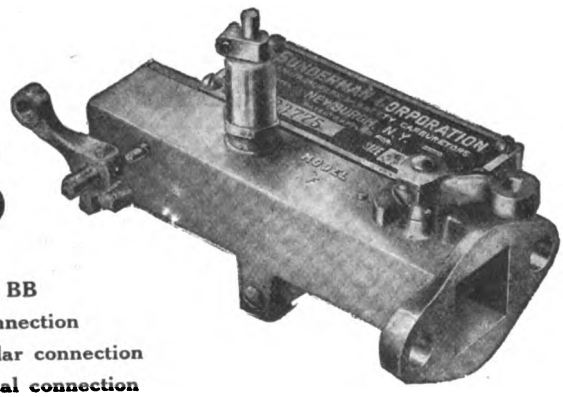
May 29, 1918.

Sunderman Corporation: Will you please quote me best prices on your Ford Manifold? I am using one of your carburetors and will say I have tried several makes and yours has given me the best satisfaction. I drove to Gladbrook and back last Sunday on one gallon of gas, a distance of 34 miles.—R. H. Cheney, Grundy Center, Iowa.

Ran 35,000 Miles Without Trouble

June 14, 1918.

Sunderman Corporation: Send me a carburetor for my Ford car. I have sold my car and the fellow who bought it would not let me take it off. I used the one you put on my car last year and ran it 35,000 miles and never had any trouble at all.—Frank R. Witman, Albany, N. Y.



A Dominie Gives Testimony

June 10, 1918.

Sunderman Corporation: The Sunderman Carburetor which I installed on my Maxwell Model '14 last year has given more than mere satisfaction. It is a marvel of economy, and has practically cut our gas bill down to one-half. We have averaged 30 miles per gallon on Standard Oil Co. gasoline, using exactly 10 gals. on a 300 mile trip.—Rev. G. Mack, Ashton, Ill.

The Quick and Economical Way to Restore the Finish on Dull-Looking Cars

WHEN a car becomes dull because the original varnish has lost its lustre, a coat of **PANVAR** will make it bright and the finish as lasting as the day it left the factory. Because your car has a dull, shop-worn look it does not follow that it needs an expensive repainting job. If the paint is good, all it needs is a final coat of **PANVAR.**

PANVAR has qualities not found in varnishes. **PANVAR** is as thin as water so anybody can "Flow it on" from a wide brush. Being "self-levelling" it will not show streaks or brush marks. It is transparent so it can be used over any color.

PANVAR, when applied to the plated parts, adds to their life and preserves the shine. On the leather seats, and imitation leather, too, it is fine. It makes leather last longer and does not stiffen it, nor will your clothes stick to the seats on hot days. It helps the tops also—they become more water-proof after **PANVAR** has been applied. **PANVAR** will not crack, peel or craze, show flaky or turn white.

PANVAR

Dries Over Night

One quart will do an average car. Price at all live dealers is $1.50 a quart, 4 quarts for $5.00.

THE GREAT FEATURE WE CLAIM FOR PANVAR IS that with **PANVAR** you can refinish your car yourself and know it will be a good job—it's amazingly easy to apply. The finish lasts as long as it would with a costly varnishing job.

THINK OF IT—APPLY TONIGHT AND RIDE AS USUAL TOMORROW—but in a nice, bright, new-looking car.

Should your car need repainting, insist on a coat of **PANVAR** being first applied as **PANVAR IS ELASTIC** and paints are not—so a coat of **PANVAR FIRST,** as an undercoat, will help hold the paint together. **PANVAR IS EQUALLY AS GREAT AS A PRIMER OR FINISH.**

SEND $1.50 FOR A QUART OR $5 FOR 4 QUARTS

(Delivery charges paid to all U. S. points) or send 10 cents for a sample if you wish to try PANVAR before ordering.
(It is guaranteed to do what is claimed for it)

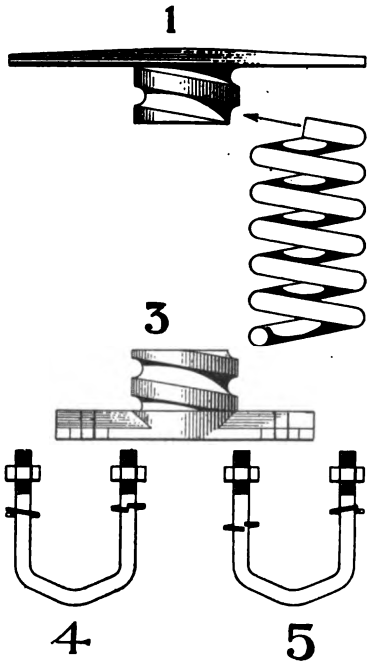
Broken Springs, Delays and Big Repair Bills



THIS

FOR - - - $6.50

Can Be Installed in Less Than 20 Minutes by the Average Layman.

PLUNKETT SHOCK ABSORBERS

"A Shock Absorber and Rebound Snubber in One"

No. 1. Fastens under front spring as shown in illustration below.

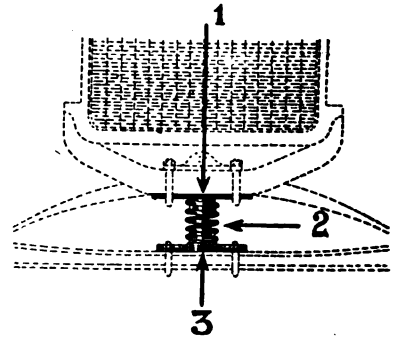
No. 2. Screws snugly into grooves or threads on Nos. 1 and 3 the same as you would screw a nut on a bolt.

No. 3. Is fastened on to axle with U bolts (Nos. 4 and 5) as shown in illustration below.

NOTE. The principle of the Plunkett Shock Absorber is that it is placed into position on the car without any tension or strain being on the shock absorber spring.

In other words—when the car is standing still, the shock absorber is in a normal position; therefore, when the car starts it takes the slightest action or greatest concussion. On the rebound motion of the car, as soon as shock absorber spring reaches its normal position, it starts to stretch or pull, thereby positively eliminating the extensive rebound which is so common on Ford cars.

The Plunkett Shock Absorber can be installed without changing or altering any of the Ford parts or taking away any of the natural action of the Ford spring as intended by the Ford Motor Car Co.



Price, $6.50 each complete

On receipt of check or money order, will ship prepaid to any part of the United States.

The perfect piston ring that makes the motor sing

Worn out, inefficient piston rings leak and waste as high as 25% gasoline—1 drop in 4.

Hi-Comp Piston Rings deliver every atom of power from every drop of gasoline. Its design is logically right and it is mechanically perfect.

HI-COMP PISTON RING
THE RING THAT MAKES THE MOTOR SING

Made from two perfectly balanced eccentric rings into one perfect concentric ring, from secret process grey iron. Each ring ground and polished under oil—not buffeted—to preserve the right temper and insure perfect fit. Each of the two rings subjected to minutest micrometer tests. Every complete Hi-Comp ring is critically examined by experts.

It will pay you to install Hi-Comps. They satisfy. They overcome usual troubles due to carbon—wearing down of cylinder walls, pistons and piston rings; faulty ignition, skipping, knocking; pitting of valves and valve seats; smoky exhausts. Made by an old established piston ring company. GUARANTEED to give MORE POWER on less gasoline and oil.

Write for interesting booklet, specification chart and details of 90 day guarantee.

You Wouldn't Wear a Shabby Hat!

WHY LET YOUR MOTOR CAR WEAR A SHABBY TOP

When it is So Easy and So Inexpensive to have it looking neat and new?

TREAT IT TO *ONE COAT* OF

Frank Miller's Mohair Top Dressing

and its appearance will surprise and delight you.

Not a bright, shiny gloss, but a soft, silky black lustre,—the quiet, rich finish so much desired for cars of the better class.

Note: Never use on a mohair top any dressing which contains ingredients injurious to rubber. Alcohol, Benzine, Gasoline and many oils which are to be found in nearly all dressings attack the rubber insert of the mohair cloth and destroy its water-proof qualities.

Such dressings will ruin your top eventually. Frank Miller's Mohair Top Dressing is non-corrosive. Do not allow your dealer to sell you something "just as good." **There is no other like Frank Miller's.** If your dealer will not get this harmless dressing for you, write us direct and we will see that you are promptly supplied.

Prices East of the Mississippi

Pints, 90 Cents **Quarts, $1.50** **Gallons, $4.50**

One quart is enough for top and side curtains. The finish lasts.

MANUFACTURED BY

THE FRANK MILLER CO.

347 WEST 26th STREET NEW YORK

An Unexcelled Reputation for Over 80 Years Stands Behind All Frank Miller Products.

For black leather cushions, seats and tops use Frank Miller's Bright Water-proof Leather Dressing.

DETROIT DETACHABLE WEATHERPROOF TOP

Storm Tight from Windshield to Rear Window

Eliminates, instantly, all the Ford drivers' former hardships. It is the only all-weather top that does away with the objectionable features of a detachable top and affords the car owner an enclosed or open body for year-round use at a really low price.

Adds limousine comfort to Ford touring cars and roadsters.

It is Absolutely Rattle Proof and Will Last as Long as the Car

Detroit easy sliding flexible doors, which disappear into the roof, are three inches wider than the doors of the Ford; this gives ample entrance for the occupants even though the arms may be filled with bundles. For the other 9 big improvements, see our literature.

SHARRER PATENT TOP CO.

A Fine Fall and Winter Proposition for Dealers

Also for Chandler Light Six, Hudson Super Six, Chalmers 5-passenger, Buick D-6-45, Maxwell '18 Touring and Roadster, Overland '83, Chevrolet 490—'16, '17 and '18.

WILL TIRES GO DOWN? THEY WILL.

VALVE REPAIR TOOL
(Actual Size)

Slow leaks are generally caused by leaky valves due to the plunger not being properly seated. A true threaded valve will never leak.

Make sure your valves are accurately threaded by using

A. & H. Valve Repair Tools

It is just as important to have the valve plunger leak-proof as it is to have the inlet and exhaust valves properly seated to prevent power loss in your motor.

This is what you can do with A. & H. Valve Repair Tools:

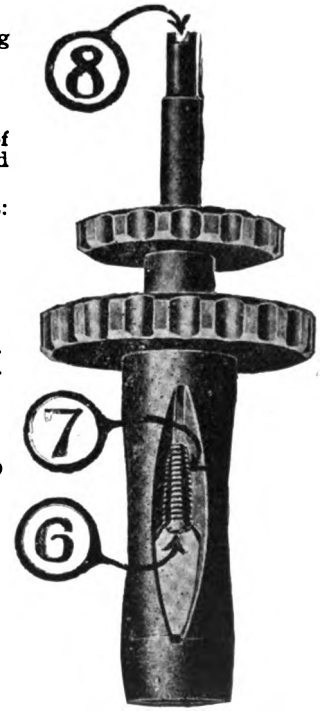
1. Recut outside stem threads.
2. Take off hexagon nuts.
3. Remove broken plungers.
4. Remove broken plungers.
5. Ream off rough nipples.
6. Recut inside plunger threads.
7. Recut outside nipple threads.
8. Take out plungers.

A WONDERFUL COMBINATION

Two Tools for $2.00

To the Trade.

$1.13 each if bought separately.



List $1.50 Each.

Endorsed by all the leading tire manufacturers.

Ask your Jobber.

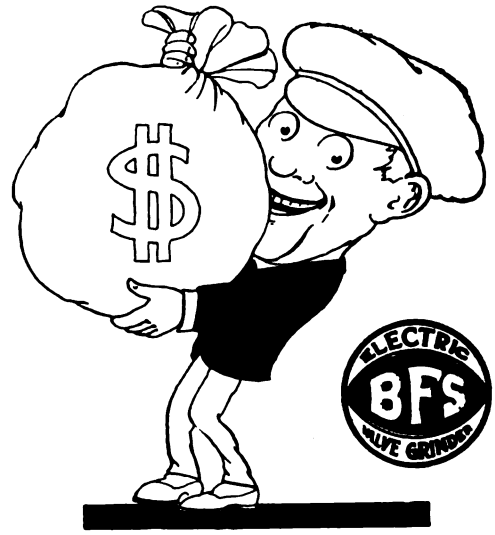
"I'M NOT SORRY

I USE THE B. F. S. VALVE GRINDER"

Here's a rush job!' Now don't go up in the air!—in these days of labor scarcity, all shops *need* help and need it quick.

The B. F. S. Valve Grinder bears the same relation to hand valve grinding that a twin six does to a yoke of oxen in a speed contest.



Saving two-thirds of the time is a conservative claim on our part. Quicker, better, and more uniform results are obtained even when done by less skilled labor.

Hand valve grinding has already become obsolete among Private car and Commercial Truck owners, Service Stations and Public Garages where efficiency counts.

Can you compute the value of getting out a "Rush Job" two to three hours sooner with a B. F. S. Electric Valve Grinder in times like these?

It is a compact, portable motor-driven device capable of grinding perfectly the valves of internal combustion engines, in a fraction of the time usually required by hand methods.

Every day you are without it you are standing in your own light and blocking your own game! So get all the particulars at once—write today.

Manufactured By

B. F. S. MANUFACTURING COMPANY

54 HERMON STREET **WORCESTER, MASS.**

THE RED ROAD BOOK

288 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia	
New York	Maryland	West Virginia	
New Jersey	Delaware	District of Columbia	
North Carolina	South Carolina	Georgia	Florida

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 203 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this freelance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of May.

All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar Address:

MUNICIPAL PIER
CHICAGO

Scene of the
NATIONAL TRUCK,
TRACTOR AND ACCESSORIES
EXPOSITION

September 14th to 21st, 1918

TRUCKS—

This will be America's most representative war-time truck show—embracing the giants of transcontinental fame and the little local delivery hustlers. Trucks are in the lime-light because of their great service at the front and at home—and all the best trucks will be shown at the Municipal Pier from September 14 to 21.

TRACTORS—

Greatest ally of the Allies—all the giants of the farm and battlefield on display. Small tractors, large tractors—America's representative tractor manufacturers will participate in this great exposition—Municipal Pier, Chicago, September 14 to 21, 1918—a stimulant to the broader agriculture necessary to meet war-time needs.

ACCESSORIES—

A big part in war-time conservation is being played by automobile accessories which increase efficiency—mileage and service—and decrease cost of upkeep and operation. The accessories shown at The Pier, September 14 to 21, will bring home to everyone the tremendous strides which American manufacturers have made toward helping to win the war.

SAVE 60% WHEN YOU RUN YOUR FORD

Use Kerosene

DRIVE YOUR CAR TWICE AS FAR AND BUY YOUR FUEL FOR LESS THAN HALF.

OFFICIAL TEST
DETROIT AUTOMOBILE CLUB
June 4, 1918

UNDER instruction of Mr. W. S. Gilbreath, manager of the Club, I acted as observer of a test run made with your Kerosene Equipment on June 3rd.

The equipment in question was attached to a 1914 Model T Ford, which was not in the best mechanical condition at the time.

One and one-fourth gallons of Kerosene were consumed in the test, a distance of 37 7-10 miles being traversed, much of this on ordinary country roads. About eighteen miles of the trip was through fairly heavy traffic. A speed of 22 miles per hour was maintained.

Performance of the car was equal to, if not better than could have been done on other types of fuel.

DETROIT AUTOMOBILE CLUB,
E. W. SULLIVAN, Observer

$3.82 SEVENTH EDITION $3.82
DYKE'S AUTOMOBILE ENCYCLOPEDIA

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 Instructions—Simplified and practical.

3500 Illustrations—the kind you understand at a glance.
3 Supplements, parts printed in colors, treating on the construction, operation, repairing and adjusting of the **FORD** and **PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc. **Airplane Supplement.**

775 illustrations and 279 pages on Electric Ignition, Electric Starters and Generators, etc.

51 pages and 254 illustrations on Adjustments, Tests, etc., of leading Electric Systems.

154 pages and 1189 illustrations on Repairing. Oxy-Acetylene welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and 180 illustrations on Tires and Tire Repairing.

44 pages and 119 illustrations on Carburetion.

89 pages and 291 illustrations on Engine and Parts.

16 pages on Digest of Troubles.

6000 lines to the Index. This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index begins on colored paper, easy to refer to.**

Dictionary is also included, which gives the meaning of motoring terms.

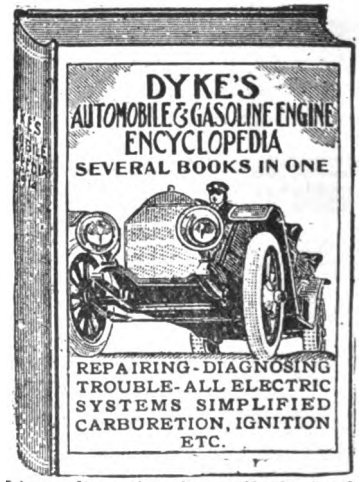
Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS

TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

BUILD UP BIG BUSINESS-MAKE BIG MONEY

Open a tire repairing shop, the great money making business of the age. Work will pour in. Men starting without experience—now making big money. We instruct you free. Outfit pays for itself. We have 1,000 more vacancies to fill. Golden opportunity.

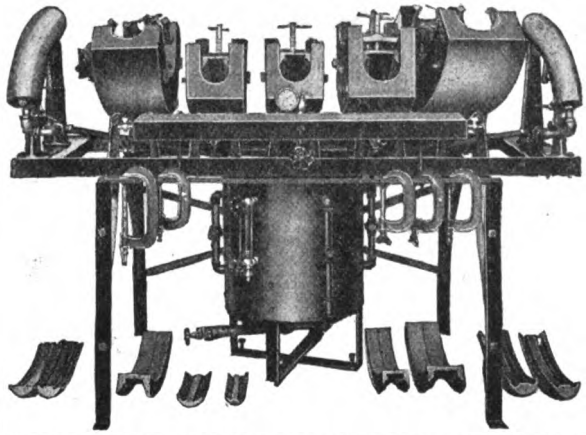

Illustration shows Vanderpool 5 cavity model that does every kind of repairing—($100.00 worth a day). Also made in 2 and 3 cavity (smaller) sizes.

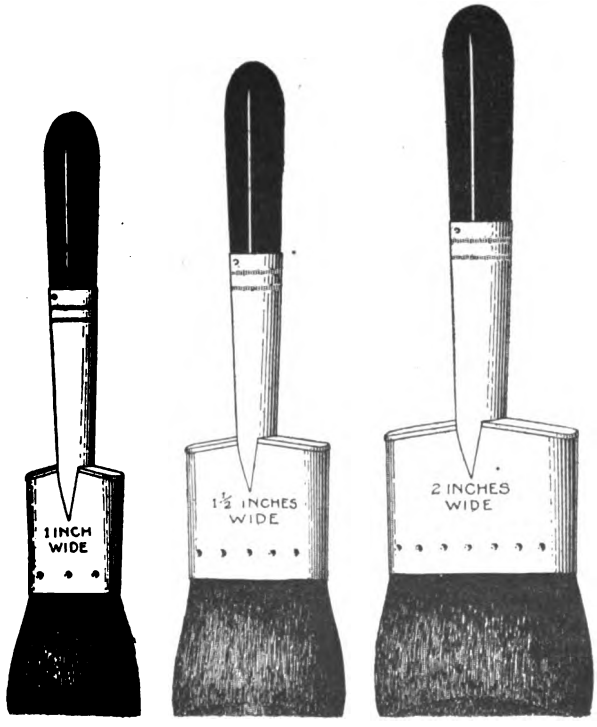
Price of new tires going up so high, car owners MUST have old tires repaired. But be sure—get the RIGHT Outfit. There is but one that operates upon CORRECT principle—the

VANDERPOOL VULCANIZER

Only vulcanizer recommended by leading Tire factories because the only one that repairs tires EXACTLY AS THEY WERE MADE. The VANDERPOOL is the vulcanizer now bought by VETERAN Tire Repairers after trying other makes and DISCARDING them. Cheapest of all to operate. Write for Free Book of instructions. Tells everything. Testimonials from Vanderpool users now making big money. Get into business for yourself. Be independent!



In answering, address Dept. B

The Vanderpool Co., Springfield, Ohio

Don't Have the Constant Fear of Losing Your Job

IMPORTANT POINTS ABOUT PAINT AND VARNISH BRUSHES

A Set of Three Brushes and the Automobile Dealer and Repairer for One Year for $2.00

Brushes Needed in Repainting and Varnishing an Automobile.

Did it ever occur to you that there was much difference between a good paint or varnish brush and a poor one? Probably not. To most people a brush is just a brush. Yet an analysis shows that there is an almost measureless difference between a good brush and poor one.

For instance, a properly made Flowing Fitch brush is hermetically sealed, so as to keep the paint, or whatever may be used, from getting into the brush at the top and loosening the hairs. All such properly made brushes are solidly set in glue cement inside a leak-proof ferrule, and a whole row of neatly clinched nails are driven in at the end of the ferrule to give added security, and a guarantee that the hairs will not pull out.

A Fitch brush is *smooth*, *soft*, and *flowing*, and does not "mush" up or get flabby like a cheap brush, but holds its springiness. The trouble with cheap brushes is that the ferrule is nothing more than a single band of tin, open at the top, with a couple of nails jabbed through. When you use such a brush the cheap hair will pull out and scatter all over your work, because it is not held in securely enough to stand the drag of the brush in painting or varnishing.

A brush may be washed with gasoline or kerosene oil, but to clean it thoroughly turpentine should be used. No brush used for painting should be used for varnishing.

We have recently made arrangements with one of the best manufacturers of these properly made brushes in New York to offer a set of Three in connection with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year for an even $2.00. These brushes sell at retail for $1.40. It will be seen, therefore, that there is a substantial advantage in sending to us for the AUTOMOBILE DEALER AND REPAIRER for a year, and for a set of these brushes.

Present subscribers can have their subscriptions extended for a year, and secure a set of brushes, on the same terms. These brushes are guaranteed in every respect, and though they cost more than cheap brushes would cost, they are far cheaper in the end, because of their lasting qualities and the good work that can be done with them. No man can afford to waste expensive paint and varnish on an automobile by using a cheap and poorly constructed brush, such as is usually to be found wherever brushes are sold. The ordinary dealer in brushes himself as a rule has very little knowledge of the quality of the brushes he sells.

Remit by check or money-order, and your name will be entered as a subscriber to the AUTOMOBILE DEALER AND REPAIRER for a year, and a set of these brushes, which are just the right size and shape (see illustration, which is exactly one-half the actual size of the brushes,) will be sent to you, postage prepaid.

POWER

FROM PISTON RINGS

Good oil engineers have found that 80% of the excess oil and unburned gases pass around and behind reciprocating piston rings. The result is lost power and excessive carbon.

PRESSURE PROOF PISTON RINGS

cannot reciprocate. The spring expander automatically takes up any excess in the ring groove. All possibility of either oil or gases passing between the cylinder walls and the piston is overcome. This is why Pressure Proof Piston Rings permanently eliminate carbon and restore maximum power.

Write for "New Facts About Piston Rings" and special dealer proposition

Big Profits in HB Battery Charging

The demand for recharging auto storage batteries is growing larger every day. The curtailment in automobile manufacture means more last year's cars in use, more batteries to be recharged, and *bigger business* and *bigger profits* for the up-to-the-minute garage.

This HB 500 watt battery charger will recharge any make or size battery, handling 1 to 7 batteries at a time. Operated from city current or engine, without any electrical or mechanical experience. Current costs only 12c to 15c per battery. Autoists pay 75c to $1.50. You make 60c to $1.35 on every battery you charge. Hundreds of HB owners are clearing $40 to $60 extra profit every month. So can you.

$15 Starts You in This Money-Making Business

Cash payment of $15 puts charger in your garage. Balance in 9 monthly payments of $20 each, which earnings should easily more than pay. Tear out this ad and send it with your name for full particulars or send first payment of $15 with trial order. Under *absolute money-back guarantee* you can return machine if it is not satisfactory in every way. Don't wait. Send trial order at once. You run *no risk* and machine itself will convince you that it can easily make *big profits for you*. Write or wire today.

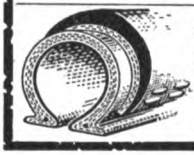
GET ANOTHER 5000 MILES OUT OF YOUR OLD TIRES



Stop throwing away your money!

Save your old tires; for they mean dollars and cents to you. It makes no difference whether they are sand blistered, punctured, rim cut or blown out, **McDaniel will put them back on the job.**

Simply send your old tires **prepaid** to the address below, with your name and address attached. When the tires are received at the McDaniel plant they are carefully examined by experts and all necessary repairs are made. The better cover is telescoped over the other one, then the bead is cut from the outer tire and both are firmly locked together by the SPECIAL McDANIEL DOUBLE TREAD PROCESS. Your old tires are now made into one good tire ready to give you thousands of miles extra service.

DO IT NOW—Send us your worn out tires by prepaid express today and save this extra money.

Conservation Will Win The War

Are You, Mr. Dealer, Loyally Doing Your Share Along This Big Line?

Has the spirit of Conservation permeated your establishment?

Every store, every office, every repair shop, is a front-line outpost when conservation is considered.

Prevention of waste is imperative. It is the basis for wholehearted, continuous support of our flag.

The account that you allow to run—and lose—cripples you and your power to lend to Uncle Sam.

The job that you turn out in sloppy fashion means a "thank-you" job later on, to make good.

That's waste, pure and simple.

Published in the interest of the Dealer by the National Association of Automobile Accessory Jobbers.

Poor equipment that forces you to do makeshift work for inadequate pay hurts your country, because it lessens your ability to make a proper day's income.

Business is good—cash is yours for the asking - repairs, accessories, service; everything that brings in ready money is increasingly demanded.

To win the war we must all work at high pressure and cut out every form of comeback that reduces the daily profits by a single penny.

Real Conservation means more velvet for you—new money with which to back up the United States. **Help to get it.**

Our free booklet—by an expert—on "How to Run a Garage" will help you. Write for it today.

National Association of Automobile Accessory Jobbers

30 minutes after you install

Within thirty minutes after you start your engine after installing Munger "Always Tight" Piston Rings, compression losses, with their attendant wastes, will be forever ended.

Engine troubles that seemed incurable will permanently disappear.

The secret of this super-efficiency is perfect and lasting FIT. Munger "Always Tight" Piston Rings FIT when you install them —and they continue to FIT.

By an ingenious method of peening these rings are made to conform to the shape of any cylinder, even though worn out-of-true. This peening also holds them to their original tension against the cylinder walls, and the wonderful "Always Tight" Expansion Joint compensates for wear as it occurs, preventing the slightest opening through which gas can escape.

Being made in one piece, these rings are not susceptible to the ailments of more complicated rings.

Put Munger "Always Tight" Piston Rings in your engine. Give them a fair trial. If they do not fulfill all our promises—if they do not do ALL you expect them to do—take them back to the dealer from whom you bought them, and he will return the full purchase price.

Trucks Service Satisfaction

Trucks! Are a godsend to mankind, and more so today than ever before, due to the existing conditions caused by the War. They have accomplished wonders—but they must still do more, they must be kept in service under all conditions and circumstances. They must relieve the railroad and express companies. They must carry the wounded to the rear and haul supplies to the front line trenches in France. They are everywhere, doing everything!

One of the most important parts of their construction are the bearings upon which they roll under tremendous loads that they are forced to haul. The bearings that withstand this extreme condition prove their worth as to quality and workmanship, and after being REGROUND AND REASSEMBLED WITH NEW BALLS by our Scientific Method, are better than new.

Don't lay your truck up for the want of a bearing! Get in touch with one of our branches, we have everything in Annular Bearings and if we should not have what you want, we will be glad to make it for you.

We Guarantee Satisfaction

The Right Men in the Right Jobs Will Win The War

THE true American wants to work where he will help win the war. He wants to fit in. America needs the Right Men in the Right Jobs. Only when this comes about can maximum production be obtained to support our armies at the front.

The needs of all war industries can be anticipated and met by the Government if employers and laborers will avail themselves solely of the nation-wide machinery which is at hand. The length of the War depends directly on our Country's ability to supply all War Industry with the best workers the country can produce the moment they are needed.

The U. S. Employment Service is the official bureau of the Federal Government in charge of the distribution of labor. The President has declared that it is the official agency for recruiting and distributing unskilled labor for war work.

PRESIDENT'S STATEMENT

"Industry plays as essential and honorable a role in this great struggle as do our military armaments. We all recognize the truth of this, but we must also see its necessary implications—namely, that industry, doing a vital task for the Nation, must receive the support and assistance of the Nation."

* * *

"Therefore, I solemnly urge all employers engaged in war work to refrain after August 1st, 1918, from recruiting unskilled labor in any manner except through this central agency [the U. S. Employment Service]. I urge labor to respond as loyally as heretofore to any calls issued by this agency for voluntary enlistment in essential industry. And I ask them both alike to remember that no sacrifice will have been in vain, if we are able to prove beyond all question that the highest and best form of efficiency is the spontaneous co-operation of a free people."

WOODROW WILSON.

It has over 500 branches throughout the nation, and 20,000 U. S. Public Service Reserve enrollment agents. Ask the local post office or newspaper for name and address of the nearest representative, or write to the U. S. Employment Service, Washington, D. C.

Those employers in war work who seek to get labor through their own or private recruiting agencies are interfering with the Government's machinery and preferring their interests to those of the nation. Only through strict compliance with the Government's program can the constant, restless shifting of labor from one war job to another, with the consequent diminution in production and efficiency, be prevented.

Above all, the Government urges every man engaged in war work to stick to his job until the Government recommends that he change. Any man not engaged in war work should put himself at the disposal of the nation by registering with the Public Service Reserve. This is a tremendously important duty! The war worker ranks with the fighter in the trenches. He will help beat the Hun.

United States Employment Service
U.S. Dep't of Labor W.B. Wilson Secy.

COME TO
THE LITTLE RED SCHOOL HOUSE

We are teaching thousands the right way to make Automobile Repairs

From FRANK BLUM, Ohio.

"Your paper is better on operating and repairing a car than all the other papers combined that I am taking. Your 'Trouble Department' alone is worth more than the subscription price."

From E. E. CLARK, North Carolina.

"I have had your magazine for a year and will not do without it as long as I can get it. I always look at the 'Trouble Department' the first thing. If a man has an automobile he can afford to pay ten dollars a year for the information he will get out of your magazine, if he cannot get it for less."

Fill out Coupon and mail today

Send us the names and addresses of several of your friends in a letter if you wish to get them in the little red school house for 3 months free.

100% efficiency is solving one of the most vexing problems of motoring.

Pontoklene removes tar like magic! Makes tar melt and run like the proverbial snowball in a real hot place. Is also a perfect grease and oil remover—restoring the original polish of a car without rubbing. Much better than gasoline for cleaning engines.

Successfully established wherever introduced by distribution of samples. Every sample makes a buyer.

Garages supply it to their car washers because it saves hours of time and insures clean work.

The empty can makes a fine reserve oil carrier.

Prices:—1/4 Gallon, $1.00—1/2 Gallon, $1.50

Quantity Discounts to the Trade.

Delivered free upon receipt of price if no dealer in your city can supply you.

Special Proposition to Dealers and Distributors.

Get Pontoklene in stock quick—before the road-tar season starts. We will help you introduce it. After that it sells itself. Write us today.

8,000,000 Tires Need Repairs!

The yearly cost of *repairing* these tires is estimated at ONE HUNDRED MILLION dollars—the greater part of this huge sum goes to the aggressive garage men, accessory dealers and repair shops who are doing tire repairing!

Think what a field there is in tire repairing! In your own locality there are enough motorists to keep you busy—and how many more are passing every day? Every one is a customer—not merely for one job—but four or five repairs at one time!

SHALER Vulcanizer

For Repair Shops and Garages

Successful results are certain with the SHALER Vulcanizer. You don't need experience—just follow instructions—to turn out perfect jobs.

By the new SHALER Wrapped-Tread Method, casings are mended quicker, better and at less cost to you than with other vulcanizers using the old method.

The SHALER Vulcanizer has thermostatic heat control, which regulates the temperature automatically. This makes an explosion impossible, prevents overheating or undercuring the tire—and leaves you free to devote your entire time to repairing.

Any style or size of casing or tube can be repaired. The SHALER Vulcanizer occupies no more space than a bicycle, and can be moved about easily. Equipped for gas, gasoline or electricity—to suit your shop.

Large Capacity—Tubes and Casings

The SHALER Vulcanizer is absolutely high grade—designed for practical vulcanizing and intended for large volume of work. It handles six tubes and one casing AT ONE TIME—a total of 200 tubes and 12 casings in eight hours.

Figure out for yourself what this daily capacity of the SHALER Vulcanizer will mean! Consider the handsome profits it will *earn* for you—*every day in the year!*

Mail the coupon for our book telling all about SHALER Garage and Repair Shop Vulcanizers. It explains fully every detail of the vulcanizers—and tells all about the SHALER Money-Back Guarantee. Fill out and mail the coupon NOW—it will be your first step toward bigger profits.

SUNDERMAN

Vacuum Carburetor

Model F $6

For Ford, Metz and Saxon Four.

Model BB—for all other cars—without connection $8

With regular connection . . $10

With special connection . . . 12

Are You GUESSING at Your Mileage?

Find Out Definitely What You Are Getting

THE next time you fill your gasoline tank, take note of your speedometer reading. Put in 5 or 10 gallons, and when you need more gasoline take another speedometer reading to find out exactly how many miles you got from that 5 or 10 gallons of gasoline.

The Result Will Surprise You

When you actually see for yourself what you are getting, you will be surprised how much less it is than the mileage you believed you were getting.

This is a certainty, no matter what your car. Men who are calmly certain that they are getting 15 miles to the gallon discover they are actually getting 10 or 12 at most.

Here's the Remedy

If you believe you should get 15 miles from your car, equip it with a Sunderman Carburetor, and get 20 to 22.

The Sunderman Carburetor increases the mileage of any motor from 30 to 50%—and it hasn't made any difference whether the car was new and lively or old and decrepit. It is true of cars all the way from a Ford to the heaviest car on the road.

The Sunderman Principle Is Universally Successful

Many cars get mileage increases much greater than 50% when equipped with a Sunderman. We have many letters to prove this. You can prove it yourself by your own car.

The reason is the Sunderman mixing principle. By multiple jets, operating with the automatic creation of a higher vacuum, the gasoline is torn apart into the most minute particles, producing an infinitely fine vapor that gives more power—more drive—from a smaller amount of gasoline. That's the Sunderman principle simply stated.

It Gives Much Greater Power, Too

When you need power—in bad or sandy roads, on steep hills, etc., the Sunderman Carburetor responds for you as surely and resistlessly as the tank of modern warfare.

This extra power is a by-product of fine vaporization. As a natural consequence there is a much greater flexibility, a quicker pick-up, a faster getaway, less gearshifting, less carbon because of more complete combustion.

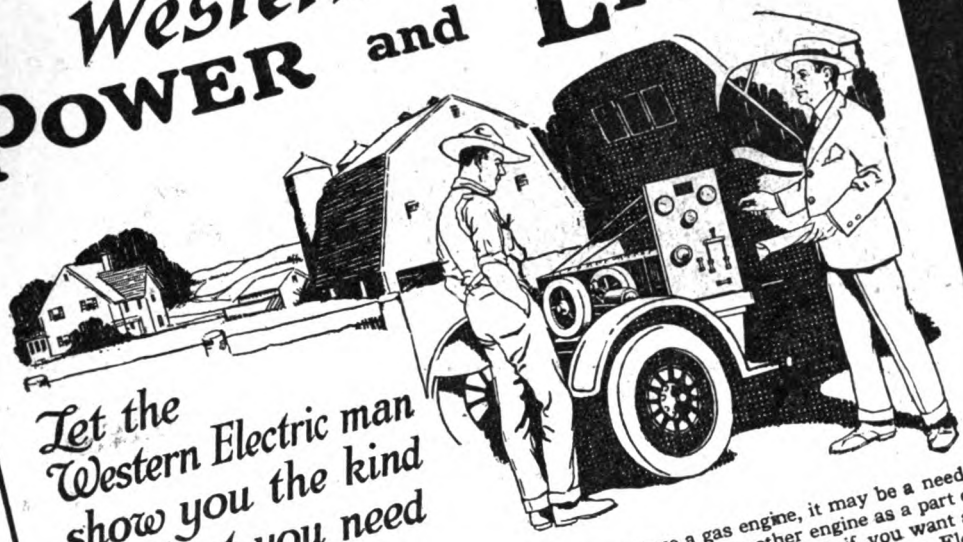
We Want You to Prove This for Yourself

Write in at once if you're a car owner—it's like money in the bank waiting for you. Let the Sunderman Carburetor begin to earn for you immediately.

If You're a Dealer, Listen

The music of the cash register will be more regular, sweeter and greater in volume if you are a Sunderman distributor. Be a live enterpriser—prove it by writing us now for our proposition.

We take care of all orders immediately upon receipt. Write NOW



Sunderman Corporation, 13 Chambers St., Newburgh, N. Y.

DO YOU WANT TO BE THIS MAN?

Western Electric POWER and LIGHT

Let the Western Electric man show you the kind of plant you need

THERE is as much difference in electric light plants as there is in automobiles or gas engines. No one type is equally suited to all farms, and your power and light requirements may be different from your neighbors'.

Like every farmer, you want electric power and light, but you don't want an outfit either too large or too small for your needs. Start right! Get all the facts! *Let the Western Electric man show you the kind of plant you need!*

Our business is bigger than the mere selling of any particular electric plant. We sell electricity for the farm. There are all sizes and types of Western Electric outfits. We are not forced by policy to sell one type for every purpose. We can sell you an outfit with or without a gas engine.

If you have a gas engine, it may be a needless expense to buy another engine as a part of an outfit. On the other hand, if you want an outfit with built-in engine, the Western Electric man will tell you about a new outfit of this type ready for delivery this Fall. In any case, it is just a matter of fitting our equipments to your needs.

More than forty years of electrical manufacturing experience is back of all these Western Electric Power and Light Outfits.

Make your entire equipment "Western Electric." You can get Western Electric Motors, Water Systems, Milking Machines, etc., to save labor on the farm; as well as Irons, Vacuum Cleaners, Washing Machines and other electrical helps to save time and labor in the home.

There is a Western Electric man near you. Mail the coupon for Booklet No. , and we will tell him to get in touch with you.

WE USE A BRUNNER AIR COMPRESSOR
FREE AIR
FOR YOUR CONVENIENCE

The confidence of the motoring public is the garageman's greatest asset. The average motorist knows that Brunner Service is absolutely dependable and has confidence in the Brunner Equipped Garage.

Without the confidence of the motorist no garage can be successful because the present day motorist expects and demands high class service and knows where to get it—he knows that the garageman who places Brunner Air Service at his disposal is a live wire with the interest of the motoring public at heart, and when he sees the Brunner Sign on a garage he has confidence in that garage and stops for air and such supplies or service as he may be in need of, and he never has to drive on his way disappointed.

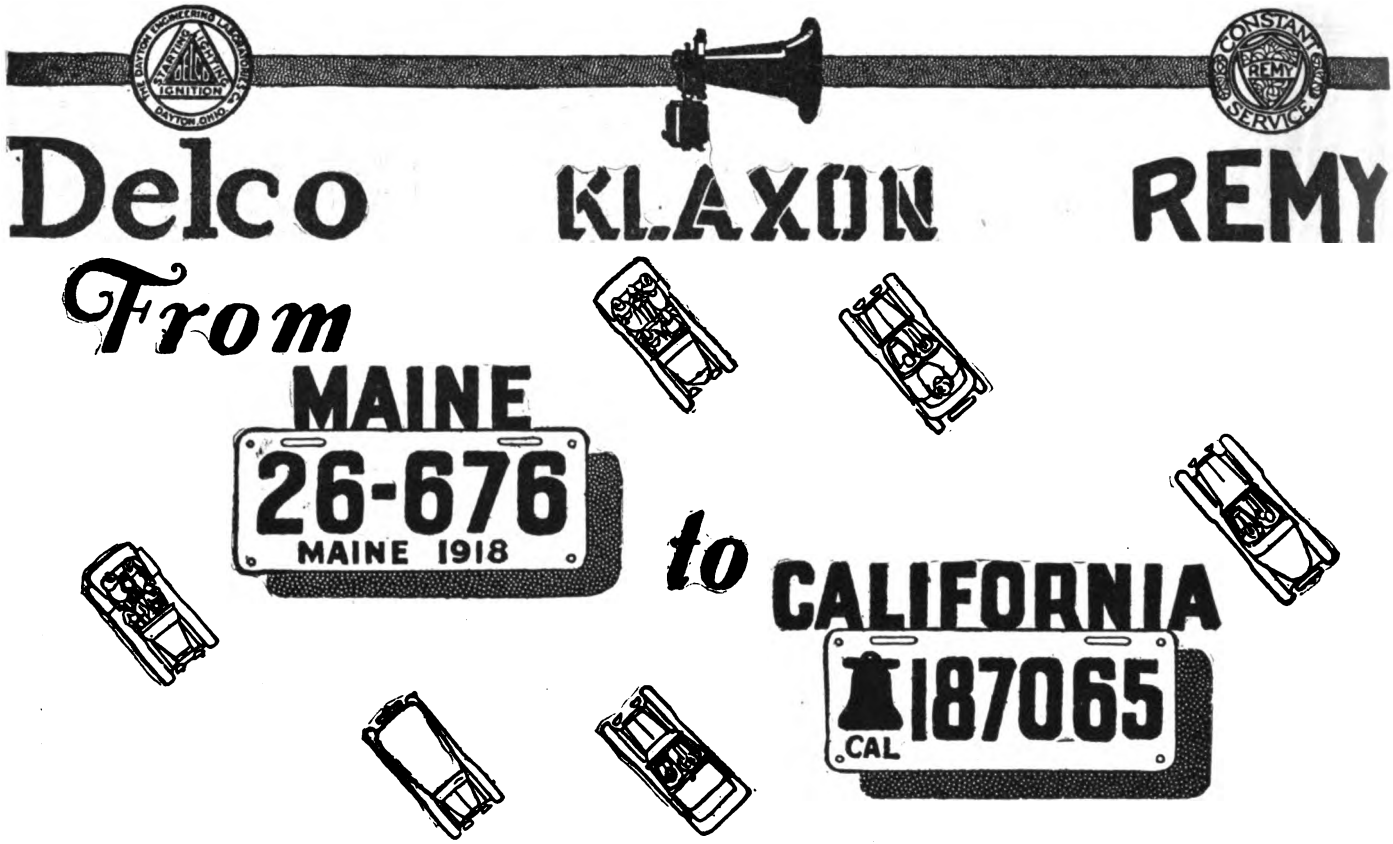
IF YOU INSTALL A BRUNNER AIR COMPRESSOR

You will find it just as dependable and satisfactory as thousands of other garagemen have found it for years. You will find it a wonderful time saver, and you will find it to be exactly as represented in every way.

You will also find the trade of the Brunnerwise motorist both satisfactory and profitable for the reason that he appreciates good service and is a good spender—he is a firm believer in reciprocity—he follows the Brunner Sign.

When you buy a Brunner Air Compressor you buy a quality product which has always been sold on its merit without resort to advertising promises of impossible performances, you receive it with the guarantee of both the manufacturer and the Brunner Jobber who takes your order that it will do the work for which it is recommended and be found exactly as represented—you cannot possibly go wrong with a Brunner Air Compressor.

"The Motorist who is Brunnerwise knows Brunner Service Satisfies"



Write for No. 15 Catalogue and the name of the Brunner Jobber covering your territory. Get acquainted with the Brunner line.

"Red Devil" Chain Drills

Fast Sellers Good Profits

The demand for "Red Devil" Chain Drills is growing daily.

Some reasons why:

They have an automatic feed adjustable to any pressure, like a drill-press. Friction is minimized by hardened tool-steel ball bearings and races. Thread is machine-cut from the solid rod, not cast. Have 3-ft. polished steel chain, extra lengths if required. Heavily nickel-plated Universal chuck holds round or square shank drills and bits 3/16" to 3/8"; alligator jaws of forged tool-steel.

Unconditionally guaranteed against defects in workmanship and to give absolute satisfaction.

If you are not already selling them, write at once for our proposition.

HURRICANE HOOK

Motor Car Door Ventilator

AN INGENIOUS DEVICE

which promotes the motorist's comfort in summer Its simplicity, utility and practicality in permitting good ventilation are bound to create a demand.

The Hurricane Hook is a 5-16 in. rod about 6 in. long. One end fastens to the door, the other to the body. It holds the door open wide enough to let in the air, but not far enough to extend beyond the runningboard. It fits flush, there are no projections to catch clothing, and it will not rattle or chatter. When not in use it can be lifted off or left hanging down. It is mechanically correct, and adjustable to all makes of cars.

Prepare now for the big demand warm weather will create. Price only 60 cents, boxed individually. The discounts are very liberal. Immediate shipments. Write or wire today.

BIG TIRE PROFITS

FOR DEALERS WHO SELL

KIMBALL TIRES

Read This, Mr. Dealer:—

Don't you want to make some real tire money? Then stop handling a few high priced tires that sell slowly and tie up your capital. Meet the cut-rate tire dealers on their own ground. Sell new clean firsts at the prices others get for seconds. Do a big business and turn over your capital several times a year.

KIMBALL TIRES are built to meet the demand for *good* low priced tires. Big dealers in New York, Chicago and other large cities are making more money on this kind of tires than they can make on high priced goods. Why don't you do the same?

There is room for a live KIMBALL dealer in every city and town in the United States. We allow only one dealer in each territory to sell KIMBALL TIRES. Many exclusive KIMBALL dealers are now doing a big business but there is still choice territory to be had. But it is going fast.

Get in touch with us. Send sample order at once. We guarantee our tires to be new firsts and will refund your money if tires are returned in five days in the condition in which they were received. Don't delay.

THE PRICES SPEAK FOR THEMSELVES

	Non-Skid	Tubes

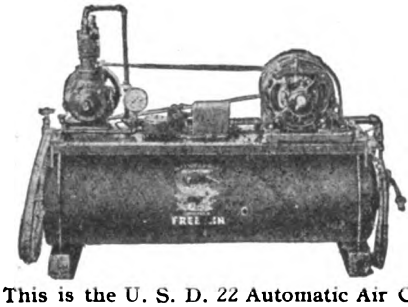
Don't delay. Mail your order today.

The Kimball TIRE & RUBBER CO.



Dept. C **1467 Michigan Avenue CHICAGO**

"Straight Side" Type shown above. Also made Clincher Type

This is the U. S. De Luxe Automatic Air Compressor, leader of the Two-Stage line, which comprises 17 numbers with capacities from 4 to 21 cubic feet per minute.

This is the U. S. D. 22 Automatic Air Compressor, leader of the Single-Stage line, comprising 4 numbers with capacities from 1½ to 21 cubic feet per minute.

Machines of Many Features

EVERY United States Air Compressor is equipped with an efficient device to separate oil from the air; and with thousands of machines in constant use for many years, we have not received a single complaint from this source. We believe the least a purchaser can expect is a machine that will deliver air free from oil, and because of this fact, we do not consider it a matter worthy of extensive exploitation.

The United States Air Compressor was the first machine to contain a Patented Automatic Unloading Device which eliminates the need of starting a motor against pressure and thereby avoids the cause of burned out motors and the attending trouble.

Any unit of the 21 comprising the United States line, contains more refinements and improvements that any similar machine.

We ask prospective purchasers to examine U. S. machines from every possible angle and to compare them, point for point, with others. We ask you to buy them only when you are convinced they contain more points of merit than you can obtain in others. In buying air compressors, don't be mislead by comparatively unimportant argument, but go "beneath the surface" as a mechanic, and demand quality for your money.

The U. S. catalogue, describing both Two-Stage and Single-Stage Compressors in detail, will be sent upon request. Send for it today.

WAR-TIME THRIFT and RISING TIRE PRICES

MEAN MORE AND MORE SALES OF

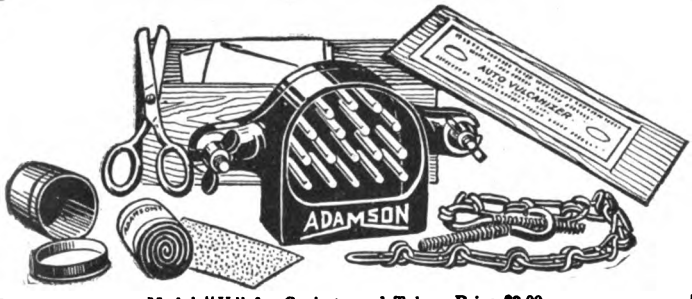
ADAMSON

VULCANIZERS

THE ONLY COMPLETE LINE

THIS YEAR motorists are learning as never before to keep their own tires and tubes repaired to yield the utmost mileage at the lowest possible cost. Patriotic Thrift and Economy demand this.

Adamson Vulcanizers best meet this demand *because:* There's an Adamson for every repair a motorist can make;—every model will use common gasoline, always easy to get and sure in its results;—they are so easily operated as to encourage their frequent use;—and finally, Adamsons are the least expensive to buy and use.



$1.00

Model "E" 5—Minute Tube Vulcanizer.

REPAIR TUBE PUNCTURES

in 5 minutes, anywhere. Pour a measure of Adamson Dry Fuel into the Vulcanizer, touch a match, and the fuel burns with a hot glow—no flame—vulcanizing the patch permanently in five minutes. Use gasoline instead of Dry Fuel if desired. Extra can of Dry Fuel 50c.; extra box of patches 25c.

Model "U" for Casings and Tubes, Price $2.00.

KEEP CASINGS MENDED

by vulcanizing cuts in tread and side-wall; prevent moisture and dirt from getting into the fabric, rotting it and causing blowouts. Conserve tires for thousands of miles more service. Use while tire remains on wheel. Make also ordinary repairs on tubes.

OTHER ADAMSON MODELS

Include Model "T" for repairing inner tubes only, priced at $1.50; and Model "S" for private garage and repairshop use, vulcanize repairs up to 12 inches, price $12.00. Adamson Repair Gum is a special compound for best results with any portable vulcanizer.

ADAMSON MFG. COMPANY

EAST PALESTINE, OHIO

We also make Adamson Ford Brake Shoes, Lined and Unlined

S-M-C

Trade Mark Registered U. S. Patent Office

Maximum service from every car—and maximum economy in operation—are the needs of the hour. Dependable brake action is a big factor in both.

S-M-C
ASBESTOS BRAKE LINING

is your best assurance of dependable brake action, in every emergency.

Look for the letters **S-M-C** on every roll, before you buy brake lining—they mean **"Safety Made Certain,"** and enduring dependable service. S-M-C is closely woven of finest asbestos, with friction wire interwoven; then compressed to exact size by massive steel rollers after being treated with the **S-M-C** Special Compound, which resists heat, water, oil and gasoline.

MADE IN ROLLS OF ALL WIDTHS UP TO 6 INCHES

Dealers, Write for Quantity Prices

STAYBESTOS MFG. CO.

5541 Lena Street **Philadelphia, Pa.**

The Modern Factory—Equipped to Make All Types of Brake Lining and All Widths Up to 6 Inches

aranteed for ,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding qualities as well as economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

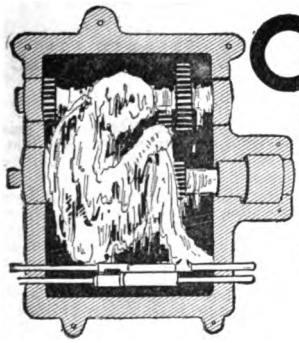
Money Just Rolling In

To Toliver Dealers

2983 Men

are now handling Toliver Tubes, Tires and Accessories—they are rapidly getting a *stranglehold on the business in their community*, they are forging to the front and *making big profits.*



Toliver Products are fast becoming famous—but even more important to you is the fact that we give cooperation and sales-assistance to our hundreds of representatives which practically *guarantees their success.*

We teach you how to start
and
We teach you how to stick

You don't have to have any capital—you can start small and grow big—we help you toward success. Certainly you can do what 2983 other men are now doing. This is the biggest opportunity that was ever offered you to get a quick start in the big tire and accessory business.

Don't let this opportunity pass. Write today for our Tube and Tire catalog—*and our Special Proposition.*

The Toliver Tube and Tire Co.,
847 Toliver Building, Denver, Colorado

Common Grease sleeps between rides

IT has to be melted before it has any lubricating value at all.

You don't have to melt

TRADE MARK REGISTERED IN
NON-FLUID OIL
UNITED STATES PATENT OFFICE

No sir, it starts when the car starts and is always ready to follow gears as soon as they start moving.

And it cushions gears perfectly against the prying force of gear shifting, increasing life of gears and adding to the mileage of each gallon of gas.

The best part of it is that you actually get better lubrication at less cost per month.

Most dealers can supply you with NON-FLUID OIL. It comes in orange cans. Use "KOO" special grade for gears. "KOOO" for all bearings.

IMPORTANT POINTS ABOUT PAINT AND VARNISH BRUSHES

A Set of Three Brushes and the Automobile Dealer and Repairer for One Year for $2.00

Brushes Needed in Repainting and Varnishing an Automobile.

Did it ever occur to you that there was much difference between a good paint or varnish brush and a poor one? Probably not. To most people a brush is just a brush. Yet an analysis shows that there is an almost measureless difference between a good brush and poor one.

For instance, a properly made Flowing Fitch brush is hermetically sealed, so as to keep the paint, or whatever may be used, from getting into the brush at the top and loosening the hairs. All such properly made brushes are solidly set in glue cement inside a leak-proof ferrule, and a whole row of neatly clinched nails are driven in at the end of the ferrule to give added security, and a guarantee that the hairs will not pull out.

A Fitch brush is *smooth*, *soft*, and *flowing*, and does not "mush" up or get flabby like a cheap brush, but holds its springiness. The trouble with cheap brushes is that the ferrule is nothing more than a single band of tin, open at the top, with a couple of nails jabbed through. When you use such a brush the cheap hair will pull out and scatter all over your work, because it is not held in securely enough to stand the drag of the brush in painting or varnishing.

A brush may be washed with gasoline or kerosene oil, but to clean it thoroughly turpentine should be used. No brush used for painting should be used for varnishing.

We have recently made arrangements with one of the best manufacturers of these properly made brushes in New York to offer a set of Three in connection with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year for an even $2.00. These brushes sell at retail for $1.40. It will be seen, therefore, that there is a substantial advantage in sending to us for the AUTOMOBILE DEALER AND REPAIRER for a year, and for a set of these brushes.

Present subscribers can have their subscriptions extended for a year, and secure a set of brushes, on the same terms. These brushes are guaranteed in every respect, and though they cost more than cheap brushes would cost, they are far cheaper in the end, because of their lasting qualities and the good work that can be done with them. No man can afford to waste expensive paint and varnish on an automobile by using a cheap and poorly constructed brush, such as is usually to be found wherever brushes are sold. The ordinary dealer in brushes himself as a rule has very little knowledge of the quality of the brushes he sells.

Remit by check or money-order, and your name will be entered as a subscriber to the AUTOMOBILE DEALER AND REPAIRER for a year, and a set of these brushes, which are just the right size and shape (see illustration, which is exactly one-half the actual size of the brushes,) will be sent to you, postage prepaid.

Address all orders to the

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

PECK'S SUPER HEAT MANIFOLDS
Are Doing Their Bit

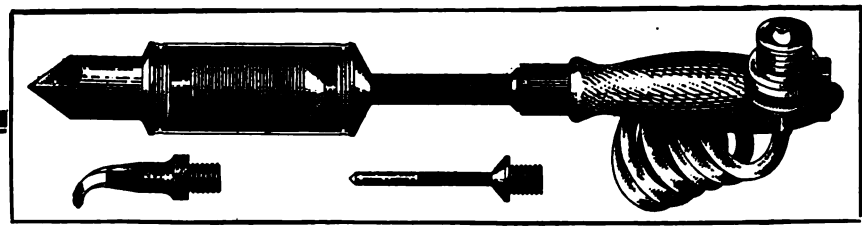
Enable Your Car to Meet War Time Requirements of Economy and Fuel Conservation.

Some of the things that PECK'S Super Heat Manifolds are guaranteed to do:

West of Rocky Mountains, $10.00

If your car is not equipped with a PECK'S Super Heat Manifold, order one today. It is guaranteed to give you from 40 to 60% more miles per gallon, with the same efficiency that could be obtained with high-test gasoline.

Cut fuel costs; increase mileage; eliminate carbon; give more flexibility, greater power; stop over-heat of motor; prevent fouled spark plugs; save trouble and satisfy owners.



With the increased cost of gasoline and with the poor quality, it is necessary to use some means that will vaporize the fuel, so the highest efficiency may be obtained. PECK'S Super Heat is the way.

If Your Dealer Can Not Furnish You, Write to Us Direct.

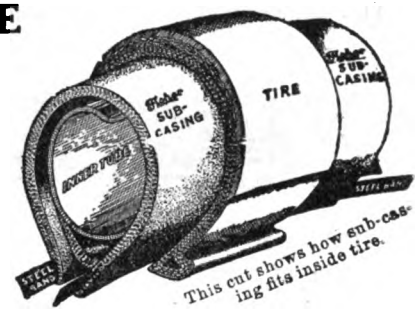
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.



A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

FISHER MANUFACTURING CO.

1706 PAYNE AVENUE, :: :: CLEVELAND, OHIO

This cut shows how sub-casing fits inside tire.

The Car Ambulance and the Patients

The Second of the "Sick Car" Series, Dealing With the Service Truck and Other Important Equipment

IN the last issue of this magazine, I likened the automobile to a person, and compared the garage with a hospital. The idea is not entirely new, for I know of a garage where a sign was posted, "Office hours from 9 A. M. to 9 A. M.," and another where the slogan is "If your car is sick, call us; our phone never goes to sleep."

In the "wee sma' hours" a phone call comes on the line "car disabled, three miles south of Wineville on the Beeville pike." Perhaps if the phone doesn't go to sleep—it gets drowsy and the garageman loses the rest of the message. Like a doctor or a surgeon he doesn't have time to ask for details—he drops the phone and "hustles" for his ambulance and to the rescue.

Away out in the country there is a patient for him; a patient who may be suffering from a broken steering knuckle or a dislocated wheel. A sick car that has been starved nearly to death by lack of lubricant or has been burned badly by lack of water.

It would never do for the repairman to visit the "patient" prepared only to change a tire or scrape in a bearing; if the sick car were suffering from another "complaint." Like a doctor, the repairman must be prepared to meet every contingency; he must be prepared to feed the car with gasoline or to take it to his "hospital" in the ambulance. If the "patient" is able to walk or limp home the garageman must be prepared to give it the necessary assistance in the nature of a tow.

The Car Ambulance.

The service truck must be an ambulance in every sense of the word. In the "car ambulance" must be carried every possible repair tool, and room must be provided for certain supplies. The ambulance must be so arranged that it is a veritable "traveling garage," else it is almost worthless.

A garageman may build up a reputation upon his service and once his patrons feel that he can be depended upon for every emergency his mechanics may be pretty sure that they hold permanent jobs. I once lived in a small country town where there was one garage. The man in charge of this garage was an excellent mechanic—a man who had "lived with" the automobile since 1901 and who knew these machines from engine to differential.

This garageman did a thriving business and depended mainly upon transients and tourists for his trade. There was one big trouble with this man, however, he was very independent. He had work enough in his shop and seldom obliged autoists by road or service trips. If an unfortunate traveler was forced to leave his machine on the road—no prayers would influence the garageman to tow it in and "wished to be" customer had to "fall back" upon the lowly equus domesticus for motive power.

This sort of treatment began to work adversely for the garageman, and when a rival opened a garage in the same town, our first hero met his Waterloo and shortly thereafter closed his doors.

The rival repairman was dependable and tried to be just as obliging at two o'clock A. M. as at two o'clock P. M. At first, he too had to call upon the horse for towing, but unlike the first garageman, he furnished the horse. He did not expect the autoist to bring all of the work to his doors, but went out after it if necessary. This sort of treatment brought its reward and soon he gained a state-wide reputation for obligingness and ingenuity. He it was who hit upon the slogan of "Call me by phone at night or day—if you can't come here, I'll come your way," and it was this garageman that built the first "car ambulance" that I ever saw.

This ambulance was, and is, a marvel of ingenuity. With it about every sort of road work can be done. I

Digitized by Google

have seen a car lifted from beneath a 40-foot embankment and I have seen the ambulance carry a 90 per cent wrecked Packard car to the "hospital."

The ambulance was large enough to accommodate a fully assembled car, and whether the machine stood on its "four feet" or was a total wreck it could be taken care of by the ambulance. I well remember the time when an "Elizabeth car" (often disrespectfully spoken of as a "tin lizzie") disputed the right of way with a freight engine at a grade crossing.

A Badly Injured Patient.

Elizabeth was badly injured, was, in fact, entirely broken up. She lay at the side of the road a total wreck, except for one wheel and the steering gear. An ordinary "Car Surgeon" would have thrown up his hands in despair at the suggestion of getting her to the hospital; yet our friend with his "Ambulance" loaded her into the machine in just 15 minutes after his arrival upon the scene.

This quick work was only made possible by the fact that the garageman had a suitable car ambulance. I will wager to say, that had Elizabeth fallen over a cliff, or anything short of a mountain, her remains could have been picked up and loaded into the ambulance in very short order, as this ambulance or service truck was such an excellent device. In this relation I will endeavor to give a complete description to cover the essential features. For want of a better name I will call the garageman Hagan, simply because this does not happen to be the name under which he is known. In order not to show any favoritism I will forget to mention the name of the truck, which Mr. Hagan purchased originally. As a matter of fact, any two-ton truck chassis may be used, provided the body is made as shown in our drawing.

How the Ambulance Was Constructed.

In the first place, the front driver's seat was moved as closely to the wheels and controls as possible, and the cab for the driver constructed of plain boards, having two panels and one window inserted.

The body proper begins just back of the driver's seat and is constructed upon cross members rather than lengthwise pieces, in all there were nine of these cross pieces. They should be made of two-inch thick oak planks and each fastened firmly to the chassis. Mortised into the lowest edge of these cross members are two lengthwise braces, which carry the last three cross braces, which cannot rest upon the frame.

The cross pieces are so arranged that their tops come above the truck tires, as shown in sketches D and E, Fig. 1, and upon them is constructed the frame as shown

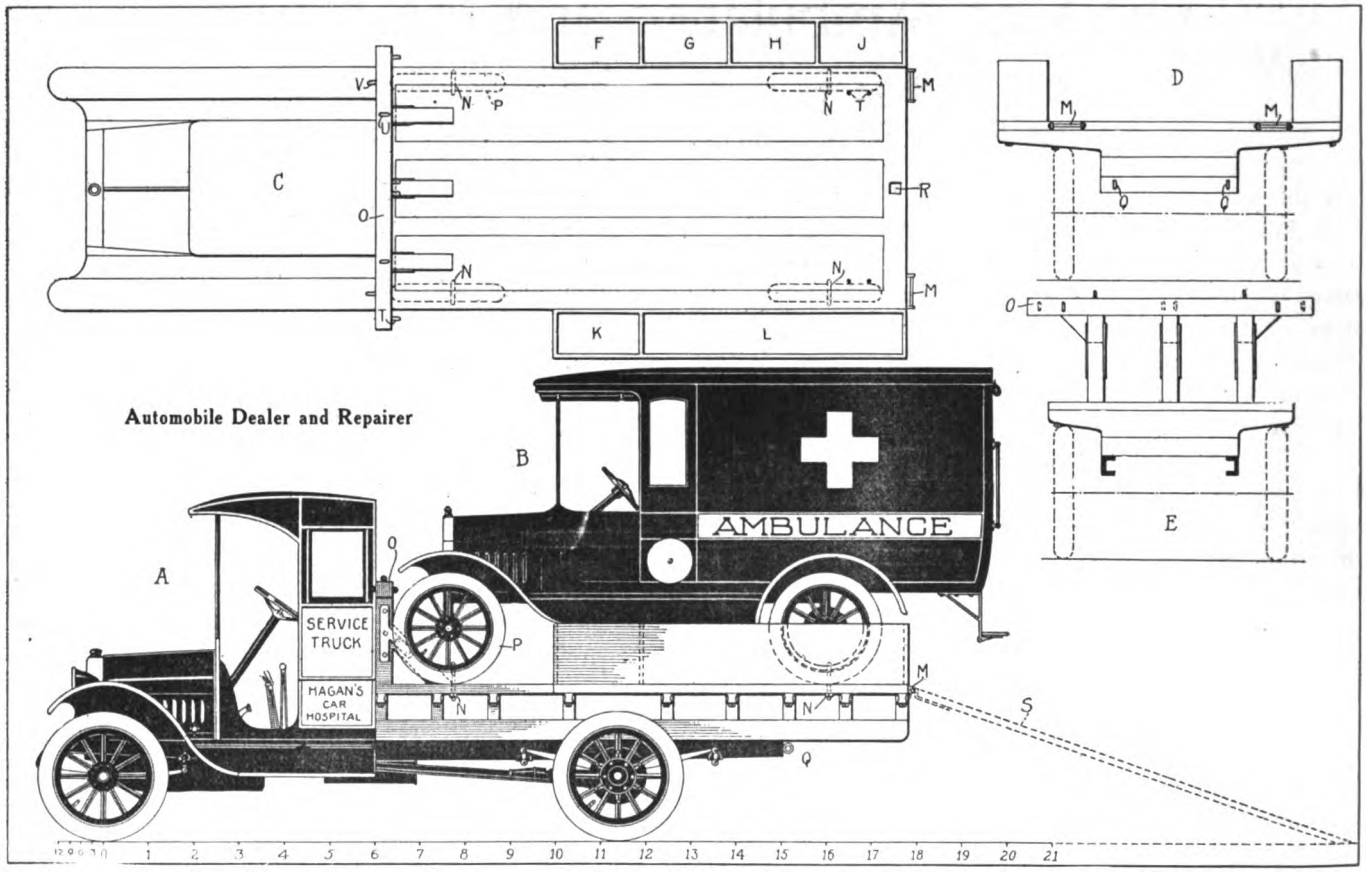

Fig. 1—Details of the "Car Ambulance" or Service Truck, Showing How a Ford Car Could Be Carried in the Body of the Machine.

Digitized by Google

in C. The total width of the frame inside dimension is 62 inches. The two sills at the sides are wide enough to permit the carrying of a standard car, as shown at B.

In the same sketch one will notice that the side boards begin just in front of the fourth cross brace and extend to the back. These sides serve to support the sectional tool boxes, as shown in C, at F, G, H, J, K and L. The depth of these sections may be anywhere from 12 to 15

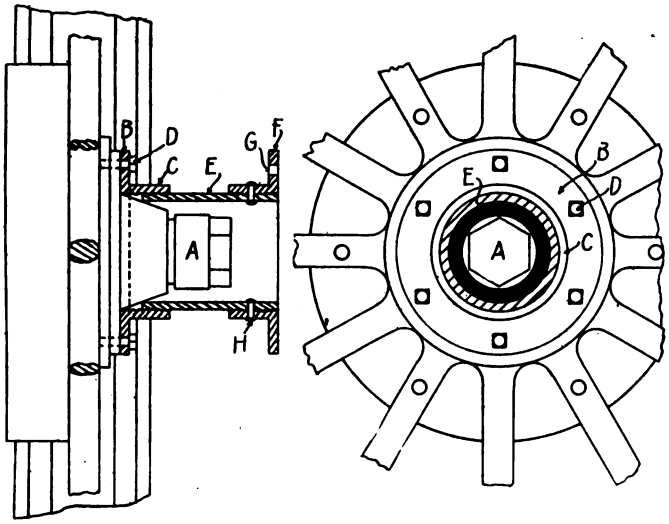

Fig. 2—Showing Details of the Drum Hoist.

inches, while the width need not be over one foot. In order to serve as a support for the tool boxes the widened body and the cross members beginning at the fourth from the front, are considerably wider, as shown at D, than are those nearer, and they are shown at E.

In reference to the sketch C, notice the hooks shown at N, which are shaped like the letter L, so arranged that they will fasten a car into place. At the rear of the body the arrangement is similar except that several holes, as shown at T, are provided for the hooks N. These different holes are arranged so that a longer wheel-based car may be locked into place. An important feature of the body is the front of the truck, a detail of which is shown at E in the various figures.

This dash board, if we may term it as such, is built of heavy oak timbers and re-enforced by three diagonal braces. At the top a 4 x 4 joist is fastened in place, fitted with a number of eye-bolts, as shown on T, U, V.

At the rear of the body there are two hinge fittings, shown at M, which consist of two braces with a bolt passed through them. Two long boards are provided, each with a hook at the end, so that they may be hooked over the members M, as shown at S, in diagram A, by the dotted lines. These boards serve as skids, up which to drag the "patient," and, when not in use, are carried in the body of the truck. A square hole R is cut in the rear body brace, to carry the derrick, of which we will speak later.

The Drum Hoist Feature.

The second feature of the device is shown in Figure 2, and consists of a miniature drum hoist, if we may be allowed to use this expression. In making this drum hoist, for each wheel, a heavy 3½ inch hydraulic pipe nipple is used; upon each end of it is fitted a floor flange. The whole device is firmly fastened to the wheel by the same bolts which fasten the wheel hub in place.

Referring to sketch, Figure 2, C indicates the flange, which is bolted to the wheel by the bolts D. Into this flange C is screwed the nipple E and upon the nipple is screwed the flange F; F should be riveted or welded to the nipple so that the nipple and the flange form one piece. Through the flange should be bored a hole G, large enough to admit the insertion of a rope or cable. The flange C remains upon the wheels at all times, while the rest of the fittings may be carried in the tool box, until used. The flanges on the left hand side of the car are fitted with right hand threads, while those on the right hand side of the car should be fitted with left hand threads.

The Portable Derrick.

The second important feature of the truck is shown in Fig. 3, and we will term it a portable derrick. At the left is shown the open derrick, from the side, in the middle the derrick is shown with the arm folded back, so that it may be carried in the tool box and at the right is shown the front view. The member A is made of oak and measures 4 inches square. Its height should be at least 36 inches. At the bottom is cut a small shoulder so that it may be fitted into the square hole at the back of the truck, shown at R in Fig. 1. The end of this projection has a square hole cut through it to permit the insertion of a wedge E.

The diagram at the left in Fig. 3 shows how the derrick looks when in place. N shows the cross section of the floor bolts of the truck. The standard of the derrick should be strongly re-enforced by two braces at the sides, B, held in place by the bolt D and a single brace at the back, C. The swinging arm is mounted upon a

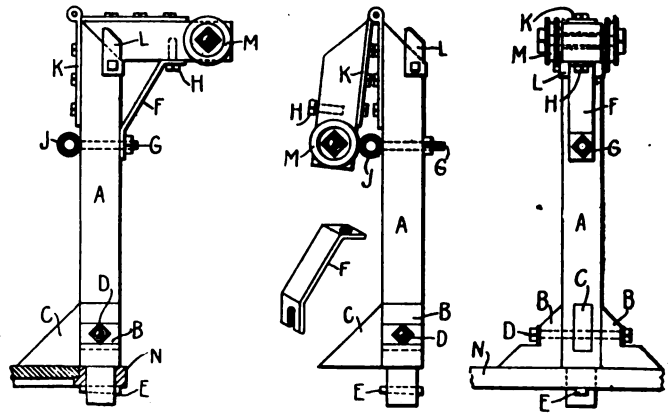

Fig. 3—The Portable Derrick and Its Construction.

large, heavy hinge, K, and held in place at each side by straight iron pieces, L. The eye bolt J, extends 1½ inches beyond the upright, while lagscrew H is screwed into the derrick arm.

A brace, F, of heavy iron is fitted with a hole at the top into which H fits and a slot at the bottom which fits over the eye bolt G. Two wheels, M, are provided upon

Digitized by Google

each side of the cross arm and may be mounted upon a piece of hydraulic pipe, held in place by a long bolt. In order that we may understand thoroughly how these various fittings are utilized let us refer to Fig. 4, which

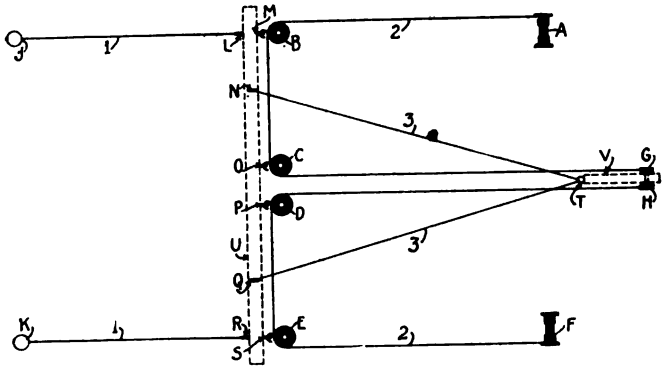

Fig. 4—Pulley Arrangement When Drum Hoist and Portable Derrick Are in Use.

gives a diagram of the rope fittings, eye bolts, and derrick. A and F represent the wheel hub or drum hoists, shown in Fig. 2, the derrick is shown in the center at V. The derrick pulleys at G and H and the cross member back of the driver's seat indicated by the dotted lines. In this case arrangements have been made to lift the car from beneath a straight drop. We will assume that the truck has been backed up a precipice as near as possible and that the back of the truck with the derrick extends over the precipice.

Lifting a Patient Bodily.

The two eye bolts V, shown in Fig. 1, are lettered L and R in Fig. 4, and are connected by length of cable to telegraph posts or pins driven in the ground ahead of the truck, as shown at J and K. These two cables serve as braces to prevent the truck from being carried over the precipice. Four blocks, B, C, D and E, are hooked into the eye bolts back in the driver's seat, while the derrick is fastened to the eye bolts N and Q by the two cables No. 3, fastened to the derrick at T. Cables No. 2 are each fastened to the wrecked car brought up through the derrick wheels G and H, through the blocks B, C, D and E, thence backwards to the wheel drums A and F.

The back of the truck is then jacked up from the ground and the engine started winding the cables, thus lifting the disabled car to the road level once more. As soon as the disabled car has been lifted high enough so that it can be fastened to the back of the truck, through the eye bolts shown at Q in Fig. 1 the truck wheels are put back upon the ground once more and the truck moved ahead.

No ambulance is complete unless it carries with it one or more "crutches." If a car is disabled and should happen to lose one of its wheels it may be just as helpless as a man who has lost one of his feet. If the man is given a crutch he can usually get along, while the same thing is true in the case of the wrecked automobile.

The Patient's Crutch.

The automobile crutch is illustrated in Fig. 5. The body, or main part of the motor crutch, B, is made up of three planks side by side, these planks are bored through at the bottom and fitted with roller bearings and sleeves, as shown at K. Most any sort of roller bearing will do, for it is not necessary to have a tight fit; most any second hand bearing will answer the purpose just as well as a new one. The heavy pipe or iron tube is slipped through the bearing and upon it are mounted the two iron wheels F. These iron wheels are held in place by nuts M and cotter pins O. The bearings are retained by a flange, J. As a towing bar a piece of strap iron, E, is used; this strap iron is given a half twist at H, and when in place, is fastened to the back of the motor ambulance, or sometimes to the car itself.

Three holes shown at G are fitted with bolts so that the length of E may be altered to fit the occasion. To fasten the crutch in place two U-shaped bolts, C, are placed on top of the device. In Fig. 5 is shown a cross section of the "patient's" axle, A. D shows the iron strap used in connection with the U-shaped bolts to hold the axle tightly in the crutch.

For a complete equipment two "crutches" should be carried together with plenty of strong rope or cable. The small ordinary repair tools are carried in the compartments F, G, H and J, shown in Fig. 1; the larger tools together with the "crutches" and portable derrick in the compartment L, while the compartment K is fitted with a gasoline tank large enough to take five gallons of fuel.

Of course there is no need for me to describe the regular equipment of small tools carried. There is one point which should be mentioned, however. Hagan never allowed anyone of his mechanics to "borrow" any of the tools from the ambulance, and he adhered to the rule himself. He realized that he owed his business to his reputation for quick service and he let nothing interfere

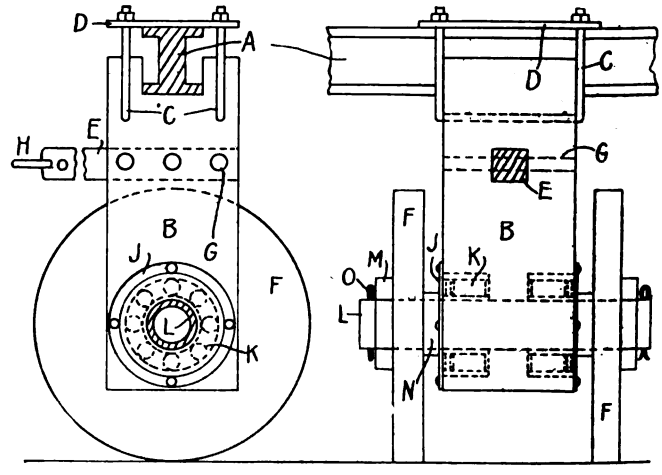

Fig. 5—Details of the Crutch.

with this reputation. A new helper or green mechanic might have taken a wrench or hammer from the ambulance once—but never twice. The penalty for breaking the rule was instant dismissal. Hagan paid his men a

Digitized by Google

good salary, was fair and honest, and men liked to work for him.

Hagan was sympathetic with his customers and I think much of his reputation was due to the fact that he was so anxious to help and prescribe for his "patients." Like a surgeon or doctor he seemed to take pleasure in doing good and repairing wrecked cars.

Hagan always had a spirit of economy mixed with his sympathy and as a proof of it I will always remember the look of grief upon his face when he went to inspect the "remains" of a "departed" Hudson car. The driver made a practice of starting in second speed at all times and had formerly owned a Dodge.

Our readers will recall that the reverse gear position of a Dodge car is in the same location as the second speed position of the change gear lever of the Hudson. The driver had hurriedly changed his gears one day and backed the car over a ten foot wall. Luckily the driver escaped but the car was a total wreck.

It had landed upon its rear wheels and had turned completely over. I reached the scene about ten minutes after Hagan and found him, literally with tears in his eyes. "And to think," said he, "An hour ago that was a new machine, now it's nothing but junk." Hagan did his best, but the machine never regained its health again.

Does It Pay To Buy Seconds?

One Man's Opinion of Low Priced Tires and How He Manages To "Pick a Peach out of a Carload of Lemons"

BY F. L. PHILLIPS

I'M not much of a writer and I can't use that smooth, flowing language of "Bill" Shakespeare, but the editor says he doesn't care, just so long as I tell my little story so that the readers can get some "real dope" on tires.

I dropped into the office the other day to get a sample copy of the "best automobile magazine published" and to have the editor look over a letter which I wrote to a friend of mine. My friend wanted to know what I thought of factory-second tires, and I wanted to see if the editor knew anything about them that I didn't.

He read my letter through a couple of times then suggested that I write an open letter to all of you: here it is; everyone may not agree with me, but everything I say has been proven by quite a few years of automobile experience.

I began to repair automobiles, back in 1908, and it didn't take long to make a little money, for the machines in use at that time sure did need lots of repairing. I caught the "fever" and within two months I owned my first automobile—excuse me, I mean my first machine; and since then I haven't been without some sort of a "gasoline buggy."

Never have I bought a new automobile, they were all seconds, and never have I purchased a new tire—they have all been "seconds" too. I figure that I am quite a few hundreds of dollars ahead of the game, just because I am careful in buying the tires. My brother bought a factory-second tire, *just once,* then he shouted "Never again," together with other words that the editor says had better not go into the magazine.

A factory-second tire, in my opinion, sometimes gives as much actual service, in the long run as a new one, if you want to take the chance. Let me tell you how some seconds get onto the market.

If you will look over a new tire, you will find that the manufacturer's name and a serial number are vulcanized into the tire. The name is usually cut right into the tire mould but the number is separate. When the green tire is put into the mould, to be vulcanized, the workman puts a little metal tag into the mould also, and this tag bears the serial number. When the shoe is taken from the vulcanizer the tag sticks to it and is pulled off afterwards. Sometimes it sticks in the mould, however.

Suppose the workman happened to be thinking of his week's pay envelope, or the happenings of the day before or the world's series and forgets to take out the little metal tag. He looks into the mould and forgets that the tag belonged to the tire that was just vulcanized, and leaves it. Then the next tire also bears the same serial number.

The manufacturer don't like to put out two tires with the same serial number, so that, if they notice the mistake, they throw one of the tires to one side and it goes into the junk heap to be sold at cost price. It is a factory-second.

Rubber is funny stuff, sometimes it runs like molasses, sometimes it won't run at all in places, and the manufacturer's name plate doesn't fill up. Unless all of the letters are clear and plain, such a tire goes into the "second" pile.

In a big factory, the inspectors are pretty strict, they don't intend to put poor tires upon the market and if there are any little flaws in the rubber, if the tread is broken or imperfect, if the fabric seems weak in places, or if the rubber has been overvulcanized the tire is thrown to one side.

Before they sell these seconds, they buff-off the names and numbers and of course they won't guarantee them for any mileage. They send them to a jobbing house that deals in this kind of tires. One jobbing house may have a great many different kinds and makes, all of

Digitized by Google

which cost them only the manufacturer's cost price and freight, so they can sell them way below the price of new tires.

There are about half a million different reasons besides this, that cause a new tire to get into the scrap heap, and it's the customer's business, when he is buying a "second" tire, to find the reason.

If you have decided to follow my advice and try a second, go about it like they do a trial in France. Assume that the tire is no good until you have proven that it contains no real flaws. Don't pay half price and expect a perfect tire and find out afterwards that it was really worth half what you paid. Don't expect the jobber to look the tire all over for you, do it for yourself.

You don't have to know very much, a tire is only a tire (sarcasm), it has only a lining and a tread. You just have to examine the fabric and the beads, and the side walls, and the tread, and the rubber and the color; that's all (more sarcasm). When you get a chance, go into a tire store and ask to see the cross section of a tire, then you will realize that a tire isn't just a tire—it is a "mechanical work of art."

If you intend to spend twelve or more dollars on a tire, spend as many minutes on the examination. First take the tire to a window where there is good light, then stick your head through it as though you were putting on a horse collar. Spread the beads apart and examine the inside of the shoe. Go over every square inch of the inside and see that the fabric is not broken at any point. Work the fabric back and forth with your fingers to be sure that the break or tear isn't filled up with whiting or filling.

Now start all over again and examine the side walls, outside and in. See that the rubber is not torn or the fabric cut with a trimming knife. Sometimes the workmen, in trimming off the ragged edges, cut through the rubber with the knife. Don't buy a tire that has poor side walls or that has the fabric showing on the outside, unless you want to spend your time on roadside repairs. I always spend my time on the examination and seldom bother on the road. If the tire is worn out, I usually know it beforehand and if I am in a hurry I take the tire off in the shop.

Start all over again for the third time and go over every inch of the bead. Make certain that the fabric passes from the inside over the bead and is not cut away from the bead at any point. You can only tell this by the feeling because the fabric is covered on the bead by a thin strip of rubber.

Now you can take your nose and head out of the tire and start upon the outside. First, feel of the rubber and see that it is soft and springy. If it feels like a rubber heel or the bit on your pipe-stem, ask the dealer for another, he'll sell the one you examined to someone that hasn't read this story.

Live rubber feels just like the heel on your foot. It is firm, medium-soft and springy. It is the kind of rubber that you want in tires. Don't take a tire that looks as though it had been painted with white paint, it is dead and the "deader" it is the quicker it will wear out. If you should leave a tire in the sun for a short time the rubber would be just like chalk. Don't accept a tire that has been in the dealer's window, unless he will guarantee it or give it to you for a birthday present.

After you have examined the outside rubber and are sure that it is not cut or broken, work the tire between your fingers, all the way around and try to locate any places where the fabric has separated from the tread. This seldom occurs in a new tire, and if it does occur you cannot always locate it. It is one of the chances you take in buying a second; and if you have followed my directions, it is practically the only chance you take.

If you are not sure of locating all of these troubles—buy a new guaranteed tire; it is safest, that's just what I told my brother because I know that he wouldn't go to the bother of examining a tire before he bought it.

Now I don't want anyone to misunderstand this article and think that I recommend second tires in every case, for I don't. If anyone has the money they should always buy new tires—if they have plenty of time and lack the money, then they should follow my directions and "take a chance" at the seconds.

I own an old car that cost me just a little over $100. It don't appear to be much, but I have often towed home some "real" cars with it. I can't bring myself to invest in a set of tires that cost more than the car did—that's another reason why I buy "seconds."

They say that in the Armour packing house all of the pig is used except the squeal. Well, to make a comparison, I always try to use not only the whole animal, but the squeal as well.

VETERAN INVENTOR KILLED.

Well Known Automobile Manufacturer Is Killed By the Car Which He Invented.

IT IS with great regret that we write of the death of Mr. Francis E. Stanley, the inventor of the steam car which bears his name. Mr. Stanley was killed on July 31 by the overturning of his car on the Newburyport turnpike.

Mr. Stanley was born in Kingfield, Maine, on June 1, 1849, and early in life evinced a tendency toward mechanics. He worked as a carriage maker, then as a photographer, and in connection with this latter occupation produced and manufactured the well-known Stanley Dry Plate.

Mr. Stanley's mechanical ability, combined with intensive study of engines, led him to work upon a small steam engine suitable for installation in a carriage, and early in the twentieth century he produced a practical steam "carriage" which he placed upon the market.

By perseverance and concentration the steam machine was improved with the passing years until it stands today a fitting monument for a great inventor.

Starving the Goose That Lays the Golden Eggs

When a Manufacturer Ceases to Advertise; He Might Just As Well Begin To Cut Down On Production, For His Customers Have Short Memories

BY FRANK FARRINGTON
Illustrated by JATT

THE mourner's bench, in manufacturing circles, is always filled with men who are regretting that they ceased advertising before they got their market fully developed or that they ceased advertising after they thought they had it developed sufficiently. In either case it is to weep over the cessation of publicity. If these manufacturers do not kill the goose that lays the golden eggs they at least stop feeding her.

The Mourner's Bench—Is Filled With Men Who Regret That They Ceased To Advertise.

Of course the example of this most familiar to us is that of the bicycle business. After most of the large manufacturers had combined, they reasoned that they might just as well save the big advertising expense they had been carrying because they had practically eliminated competition. Everybody who bought a bicycle would have to buy from them, anyway, and they thought that everybody was sold on the idea of riding a bicycle.

Well, they doubtless did well to eliminate some of the advertising expenses. It was costing one manufacturer as high as twenty dollars per machine on his output for just that phase of his publicity which took care of the racing end. But when they cut out all advertising, they simply took the shortest method of putting the "kibosh" on the whole business, and bicycles became "dead wood" and remained so for several years, as far as pleasure riding was concerned. Today advertising is bringing them back into favor, and 1917 saw 600,000 of them sold.

Haven't You Heard Small Boys Discussing Cars?

The automobile manufacturers figure that they have learned an important lesson from the bicycle industry. But have the accessory people learned their lesson, too? Automobile advertising is going to be kept up through war or peace, whether the output is oversold or undersold. Are the accessory people, once they get a market, going to reason that their market will endure indefinitely?

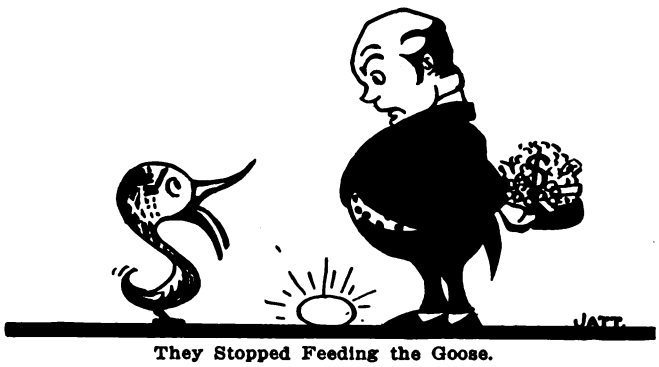
It is only twenty years ago that most bicycle riders thought of the name Lobdell in thinking of wood rims for wheels, and wood rims had just displaced steel rims. The old Lobdell factory, in Marietta, Ohio, has, to the best of my knowledge, been empty and idle most of the time for fifteen years now. I don't know where the wood rims come from, but I know that nobody's name stands for what Lobdell did stand for among riders.

Speaking of rims, it was not so long ago that we were familiar with advertising of rims in the automobile magazines. Since that advertising first began to appear, demountable rims have become so generally used that most manufacturers make them a part of standard equipment, but what kind are they using, and why? At first manufacturers evidently hoped to induce the motoring public to specify their rims in buying a car. Now, evidently, they are satisfied to take their chances of getting their share of the business from the manufacturers. I have demountable rims on a car I've driven 7,000 miles, and I don't know today what make of rims they are. In fact, there is no name on them, and I have asked the agent from whom I bought the car to find out the price of another extra rim, and he has thus far failed to do so because he doesn't know

I Know the Boys Study Those Things.

Digitized by Google

what kind of a rim it is. Exceptional instance? Maybe, but actual just the same.



Just two demountable rims names remain in my mind. One is a name I will not mention, because while I did not find the name on the rims, still the trouble I have had with those rims has compelled me to listen while several garage mechanics have exclaimed with greater or less force, "Those blankety blank ——— rims never were any good, anyway!" The other name that sticks in my mind is included in the phrase "Firestone tires and rims," which has evidently been impressed upon me by repeated advertising in the past.

Displaced by Other Products.

Two things occur to me in connection with this rim matter. One is that any manufacturer of rims who is satisfied with his rim sales today may tomorrow find that a cheaper rim has displaced his with many of his automobile manufacturer customers, and nothing can be done about it because the public neither knows nor apparently cares whose rims are on the cars. The other thing is that an advertising rim manufacturer might give the user many valuable tips on how to use his rims, how to put them on and take them off without damaging them and losing temper and epidermis.

More than this, there are many car owners who would carry two extra demountable rims, two spares mounted, if they were advertised into it; if they were educated to the advantage of having two inflated spares. Here is a big market for extra rims awaiting development and nobody after it. This opportunity is a dealer opportunity, too. There is a chance for somebody to dominate the demountable rim market.

With the arrival of the time when many accessories that were formerly bought and added by the car owner

They Stopped Feeding the Goose.

are made standard equipment on cars, the choice or preference in such accessories has passed in some degree from the buyer to the manufacturer. Perhaps it is this that has led many accessory and parts people to cease impressing their identity upon the ultimate buyer. But there are other manufacturers who are taking no chances of becoming simply nameless parts of the background.

What would Hyatt and Timken and Prest-o-Lite and Willard say to the suggestion that they discontinue advertising to the public and depend solely upon advertising to the manufacturer? They would talk to you about prestige, about the reputation they have built up for their products, and remind you that the constantly appearing new crop of automobile owners and prospective owners must be taught just what the older owners have been taught, that such names as those mentioned, and others I might mention with equal justice, stand for quality and service. They would tell you that for them to stop advertising would mean that in a few years nobody would care whether the new car was fitted with their products or with some nameless and reputationless product made to match the price the manufacturer wanted to pay in order to produce a car at a given cost.

Pride Based on Reputation.

A good deal of the pride one feels in a car is based on the reputation of the maker and on the reputation of the parts and accessories used. If you owned a car made of parts, none of which bore a manufacturer's name, and fitted with accessories of the same sort, would you brag about it? Wouldn't you be apologetic? And if the car itself bore no name—well, the only way you would become possessed of such a car would be by receiving it as a gift, and once you had it, it would stay with you because you never could sell it at any price.

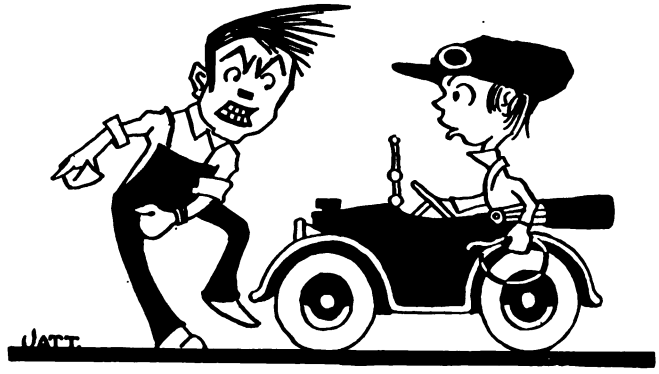
We want reputation in what we buy. Of course that reputation must be based on actual merit, but that merit must be given publicity or it counts for nothing. We want to be able to brag about our car in terms that will be understood by people who have no cars and who know comparatively little about automobiles.

The man who buys a car for the first time must depend upon reputation. He may say he goes by what the automobile salesman tells him, but he judges what that salesman tells him by a reputation. The salesman, in recommending his car to a non-driver must fall back on reputation. If he boasts that his car is equipped with a Bosch magneto, how will that be any recommendation to the prospective buyer if Bosch magnetos are an unknown quantity to him, as they must be if they do not receive advertising? The appeal that is going to get over with the green buyer is that based on something that buyer knows about, or thinks he knows about. That is where advertising of parts and accessories counts even when directed toward a public composed to some extent of non-users.

Keep the Public Sold.

Everybody is a potential automobile prospect or has influence with such a person. Haven't you heard two small boys discussing cars and saying, "Gee, if I was gettin' a car, I'd have Hartford shock absorbers on it. They're the best." When you hear such a conversation about any accessory, you know that advertising has done its work there. The boy really knows nothing about shock absorbers or whatever it is he discusses. He has been impressed by the advertising. And if Hartford continues keeping shock absorbers at the front until that boy becomes a buyer, he is sold on them.

Digitized by Google



Not only must people be kept sold on these things after once they have admitted to themselves certain superiorities, but the public must be sold on parts and accessories, on reputations, in advance of the day when it can be sold in actuality. If I were advertising automobile accessories, I would, provided I expected to stay in the business indefinitely, begin by going into the juvenile publications and getting the boys on my side. I know the boys study those things and they influence their parents, and of course the boys grow up with ideas absorbed when they are young. There is a big interest nowadays in mechanical things among the boys. I saw a new public library opened the other day and the first patron was a boy of ten who wanted a book on electricity, and a large proportion of the first day's visitors were boys like that, looking for just such books.

I have been talking mostly about advertising to the ultimate buyer. It is just as important to keep the dealer sold as to keep the consumer sold. Unfortunately the automobile business is so young that we cannot draw contrasts between two periods ten years apart. Conditions have changed too much in a decade. But go into a garage to-day and note the names you see on tires, tubes, accessories, etc. How many of those names were there five years ago?

Of course the change shows the rapid growth of the industry, but it also shows that many standard articles of five years ago, popular then, have been relegated to the rear or thrown out of stock simply because the manufacturers have become self-satisfied with a prosperous business and a big demand and have stopped advertising, while newer manufacturers in competing lines have been generous in their use of publicity and have secured the trade. Many a manufacturer, keeping his product right up to date, equal in quality and improvements to any, has seen other lines, no better, get the call because of their advertising and his silence.

Do you suppose the Delco people would be where they are to-day if their heads had not brought to the business with them the National Cash Register faith in persistent publicity as well as the N. C. R. selling experience? If they have displaced the magneto ignition in many cases, hasn't it been partially due to their continued publicity, which has popularized Delco with the car owner while magnetos have not been advertised? "Printer's Ink" stated recently that the reason for the decline in magneto equipment on passenger cars is due to the magneto people discontinuing advertising. This may be putting it too strongly, since the increase in use of magnetos on commercial cars, tractors and aeroplanes has kept the demand up to the supply and even above it, still the time may come when magneto manufacturers will be back again after the automobile market they used to have. They will find it more expensive to win back the public than it would have been to hold it.

Practically every manufacturer has his experiences with users of his product who get unsatisfactory results. These dissatisfied buyers condemn his goods and injure their sale to others. The manufacturer who does not advertise suffers most along this line. He who does advertise has his opportunity to win back that dissatisfied customer. I have in mind a driver who equipped his car with a make of non-skid tires that proved unsatisfactory. He had seen them well recommended, and he knew others who had secured good mileage from those tires. But in his case they proved a poor investment, and

Those Blankety —— Rims Were Never Any Good.

he proceeded to knock them at every opportunity. But he kept seeing the advertising of those tires. He continued to note the manufacturer's claims of superiority until he began to wonder if there hadn't been something exceptional about their failure in his case. He made some figures on the weight of his car and load and the size of the tires. He decided he had been under-tired and had received as good mileage as he had a right to expect. In the end he tried the same tires again in a larger size and met with satisfaction and now he swears by those tires as hard as he formerly swore at them. It was advertising that did the trick.

I have known dealers to get the idea that they did not like a certain line, that there were other lines better, and they change over to the other lines and find the change has not been of any real advantage. Then, if they keep seeing the advertising of the first line, there is a pretty good chance of their changing back again. If they see no advertising of the old line it is a safe bet that they will not change back.

Everything points to the need for continued advertising if dealers or users are to stay sold, are to continue to buy and use a product, or to continue of a mind to buy it when they get ready to buy. The manufacturer who keeps up his advertising will not have to spend any time regretting what might have been.

Are you striving to become more efficient, or can the boys who have just learned the business give you no end of tips? Don't be satisfied to become a "has been."

Which habit are you "afflicted with" which lessens your efficiency and makes you fall short of your best? Are you master of yourself, or are you a slave to the habit? How much is it costing you per year?

The Modern Starting Motor

How the Starting Motor Is Wound and Constructed and What Happens When the Starting Switch Is Turned On and Off

BY A. P. PALMER, E. E.

STARTING motors may be considered under two headings. First, where the motor is used simply for starting purposes, and secondly, where a motor and generator are combined in one unit, the generator being used for lighting and ignition. We will consider the one function motor first.

The starting motor is similar in construction to the generator or dynamo, having an armature, commutator, a set of brushes, field magnets and field coils. As more power is required of a starting motor than of a generator, the motor is made larger and heavier. Heavy wiring is also required, as a heavy current is used in starting and a small wire might be burnt out.

The motor is the reverse of the generator in action, as electrical energy is supplied to it, it transforms the current into mechanical energy which is used in starting the gasoline engine. As much as 25% of this energy may be lost in the transformation on a small electric motor. A ¼ H. P. motor, for instance, is only about 60% efficient, while a six H. P. motor is nearly 86% efficient.

High Torque in Starting.

In cranking or starting a gasoline engine, a very high torque must be developed to overcome the inertia of the load and the latter takes the form of intermittent rather than of steady resistance to the driving effort, owing to the alternate compression and expansion in the engine cylinders.

For this kind of work, which is similar to starting elevators and trolley cars, the series motor is found to be the best. In this motor the current passes through the armature and fields in series as through one circuit. The magnetic strength of the fields becomes greater with increase of the starting current and so builds up the torque of the motor. Suppose the magnetization of the field is such that an increase in current flowing in the series field winding will increase the field strength proportionately. If the current be doubled, the motor will exert four times the pull, while the speed will be less than one-half the former amount.

The current used in a starting motor varies anywhere from 50 to 200 amperes, depending on the conditions where a 6 volt system is employed. With higher voltages, the amperage is reduced, as the watts are equal to the volts multiplied by the amperes.

The horsepower required in starting varies from one-quarter to two, depending on the size of the engine and its design. Inasmuch as considerable load is placed on the battery in starting, care should be taken not to keep the switch on for more than a few seconds.

It may take a quarter of an hour running the engine to recharge the battery if the starter is used for thirty seconds. The result of improper use of the starter is a discharged battery, and this condition is exceedingly harmful.

Motor Drive.

In turning over the engine, the motor is connected by means of a spur, bevel or worm gear or by means of a chain.

Where a separate unit starting motor is used, the gear ratio may be such that the starting motor runs from five to twenty-five times as fast as the engine crankshaft is revolved during the cranking operation.

Combined motor-dynamos have lower ratios and in fact in some cases may operate at engine speed. A very common ratio for motor dynamos is between two and one-half to one and three to one.

An end view and section of the self-starter and Bendix drive are shown in Fig. 1. This self-starter attachment is automatic in its action and may be described briefly as follows:

It consists of a hollow shaft having screw threads on the outside and a hollow gear having screw threads on the inside, so that the gear screws on the shaft like a nut on a bolt. A circular weight is fastened to the gear and is slightly out of balance. A spring coil connects the electric motor shaft and the hollow screw shaft.

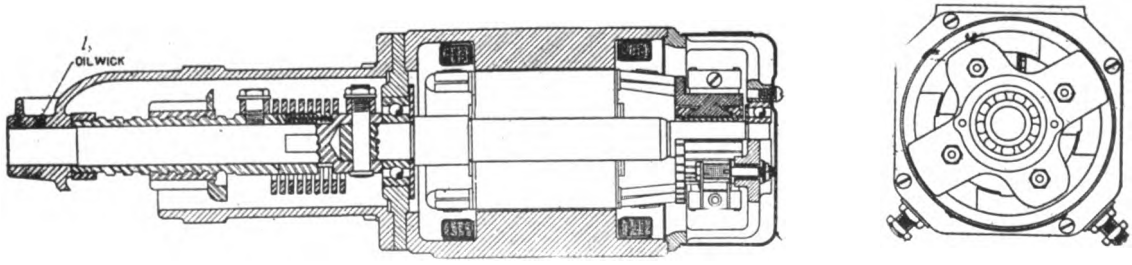

Fig. 1—A Cross Sectional and End View of Starting Motor With Bendix Drive.

When the starter switch button is pushed down, it brings the electric motor in action, which drives through the spring and turns the screw shaft. On account of the unbalanced feature of the junior gear it does not turn with the screw shaft; therefore, it moves along the

Digitized by Google

screw shaft until its teeth engage with the teeth on the flywheel gear.

The resistance of the flywheel gear then causes the screw gear to be moved still further until it reaches the stop at the end of the screw shaft. The two gears are then meshed and the screw gear, having reached the stop, must now revolve with the screw shaft. At this particular moment the screw shaft and the electric

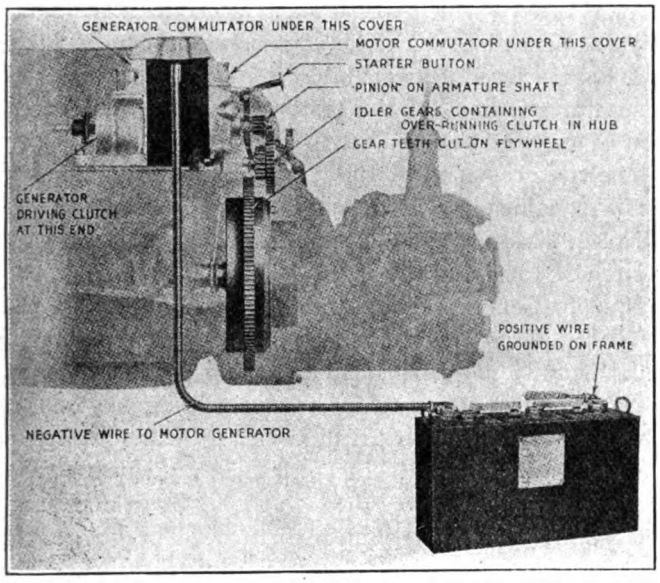

Fig. 2—Phantom View of Single Wire, Single Unit Motor-Generator.

motor are revolving at a high rate of speed and the resulting shock therefrom is absorbed by the coil spring which drives the screw shaft for that purpose.

Action When Engine Starts.

As soon as the engine explodes and runs under its own power, the flywheel turns much faster than it was cranked by the starter, and increases the speed of the screw gear over that of the screw shaft, thereby causing it to screw back out of mesh and into its original position, which position it retains on account of the automatic clutching function performed by the centrifugal force of the unbalanced weight, before mentioned, and a part of the screw gear.

When the electric motor stops running the screw gear has been fully moved away from the flywheel, and it remains in that retarded position until it is again required to start the engine. The screw shaft should never be oiled or lubricated, as it works to the best advantage when dry.

Another make of car uses the following system: When the starting button is depressed the current flows through two switches which permit the current to flow to the starting motor magnetic switch. In the magnetic pinion shaft is a powerful electromagnet having a series or pull in coil. Around the field poles of the starting motor is a short circuited winding. The pull in coil becomes energized and pulls a soft iron core into the magnet winding; the short circuit coil of the field poles prevents the starting motor from turning rapidly, as the first rush of current passes through the motor. It acts somewhat like a magnetic brake for a very short period of time.

The current which flows through the magnetic shift also flows through the starting motor, with the result that the starting motor turns slowly as it shifts the gear into mesh and then rapidly picks up speed and cranks the engine. Now, as the engine commences to fire, the current used by the starting motor falls rapidly and consequently the magnetic shift loses its excitation and a disengaging spring overcomes its pull and pushes the gear out of mesh.

In order to make the meshing positive, the teeth on the starting motor pinion and on the flywheel are cut at an angle. The effect of this is that when the starting motor drives the engine, there is a tendency for the gear to be drawn into mesh. When the engine commences to fire and tries to drive the starting motor the effect is to help push the gear out of mesh. This makes the motor fully automatic and practically foolproof. As the motor has ball bearings and there are no gears in mesh after the engine is started, its operation is practically noiseless.

When the engine commences to fire and speed up, the voltage of the generator builds up and the cut-out switch closes, grounding the positive side of the

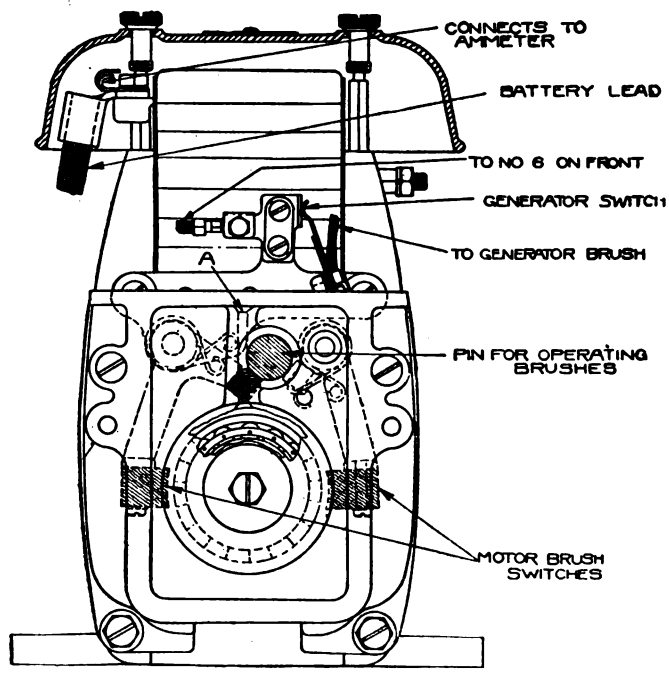

Fig. 3—Motor End of Motor-Generator.

generator. The instant this occurs, the wires on the generator, being grounded on both ends, cease to carry current to the primary relay switch magnet which allows the switch to open. This opens the circuit and allows the starting motor to come to rest. With this system no harm can result from leaving one's foot on the starting button when the engine speeds up, and no harm can result from depressing starting button when engine is

Digitized by Google

running, unless car should be throttled down below eight miles an hour.

Motor is Series Wound.

The starting motor is series wound and develops about .7 horse power at 5.25 volts. It turns the engine over at about 125 revolutions per minute, which is fast enough to start on the magneto.

The following system is the use of a motor generator and does not employ a separate starting motor or a magneto. This is called the single wire, single unit system. Figs. 2 and 3.

One side of the motor generator, storage battery lamps, horn and ignition apparatus is connected to some part of the frame of the car or the engine. The other connections are made with copper wires or cables.

The motor generator serves both as a generator of current and as an electric motor for cranking the engine when starting. The principal elements of the motor generator are an armature and a field. There are two windings on the armature and two in the field—one on the armature and one on the field are used when the motor generator is used as a generator and the other windings when it is used as a motor.

Action of Motor Generator.

The motor generator, when acting as a motor, has the sole function of cranking the engine. In starting the first thing the operator does is to push down the ignition lever on the combination switch. This closes the ignition circuit and the circuit between the storage battery and the generator windings on the motor generator, causing the armature to revolve slowly.

A ratchet clutch in the front end of the generator allows the armature to rotate ahead of the driving shaft. The clicking noise that is heard when the ignition switch is turned on comes from this clutch.

Next the operator pushes down the starter button. The first movement causes the starter gears to mesh with the teeth on the flywheel. The probability of the ends of the teeth striking and failing to mesh is overcome by the slow rotation of the armature which began as soon as the ignition was turned on.

As the starter button is pushed further down the current between the storage battery and the generator windings of the motor generator is broken. Upon the last movement of the starter button the circuit is closed between the storage battery and the motor windings on the motor generator, causing it to act as a powerful electric motor which cranks the engine rapidly.

As the gear ratio between the armature shaft and the crankshaft is approximately 25 to 1, the armature would be driven at an excessively high rate of speed after starting the engine and before the operator let the starter button back if it were not for an over-running clutch in the hub of the idler gears between the flywheel and the armature shaft. The electric motor cranks the engine through this clutch, but after the engine has started and begins to run faster than the electric motor, the clutch slips.

When the starter button is let up, as soon as the engine is running under its own power, the first movement of the button breaks the circuit between the electric motor and the storage battery, a further movement causes the starter gears to slide out of mesh and the final movement completes the circuit between the generator and the storage battery which was broken when the starter button was pushed down. The engine running and the circuit being closed between the storage battery and the generator windings of the motor generator, the generation of current begins.

The motor generator has three distinct functions to perform, which are as follows:

No. 1. Motoring the Generator.
No. 2. Cranking the Engine.
No. 3. Generating Electrical Energy.

The cranking operation takes place when the starting pedal is fully depressed. The starting pedal brings the motor clutch gears into mesh and withdraws the pin which allows the motor brush switch to make contact on the motor commutator. Instantly a heavy current from the storage battery flows through the series field winding and the motor winding on the armature. This rotates the armature and performs the cranking operation. The main cranking current is not conducted through the ammeter as this is a very heavy current and the ammeter on the dashboard must be small enough to show the battery charging current and the current for lights and ignition.

The Starting Switch.

The function of the starting switch is to permit the current to flow from the storage battery to the starting motor, when it is necessary to start the car. The starting switch is operated by a lever and push button operated by the foot. The lighting and motor starting wiring systems are independent of each other and may be easily found as that used to convey the high amperage starting current is of heavy round single conductor cable, while the lighting wiring is usually a light multiple strand cable.

One manufacturer of starting motors has two forms of pinion shift. The Bendix mechanical shift, a worm shaft mechanism to throw pinion into mesh automatically without shock when the motor starts and to throw pinion out when the engine picks up. Also an electro-magnetic shift, composed of a solenoid on one end of the motor which throws a spirally cut pinion into mesh with a gear on the flywheel when the starting switch is closed and which releases it when the engine picks up. Either a foot switch or an electrically operated switch with push button control can be used. The motor is entirely enclosed, protecting the interior from dirt, oil and water. The frames are of wrought iron. High magnetic permeability reduces the weight required.

The end frames are machined die castings light and

Digitized by Google

strong, fastened with heavy set screws and lock washers. Insulation and baking treatment of the windings make them a solid mass that cannot work loose. It will withstand high temperatures for short periods. The commutator is of ample size to last several years. The brushes are of metal for high efficiency and more power. Sleeve bearings are furnished because of the small amount of use and general satisfaction given by greater simplicity.

The motors are made for use with engines of any capacity up to 1,000 cu. in. piston displacement at a ten to one reduction. They vary in size according to the type of engine they are designed for. The frames are all of wrought iron pipe pressed and machined to size. The commutator end brackets are of aluminum; the rear end brackets are of wrought iron and are arranged to support the motor according to the S. A. E. standard design.

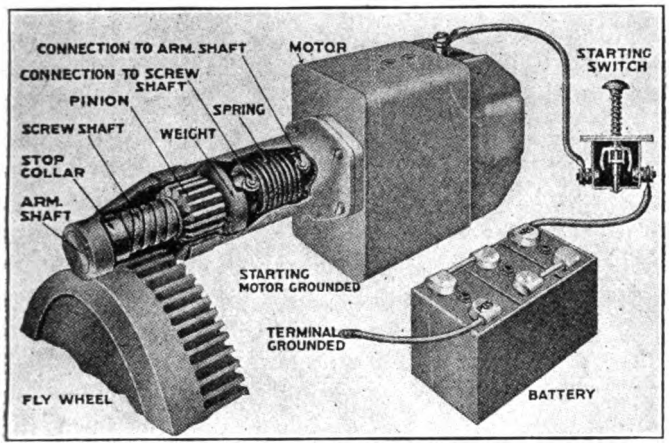

Fig. 4—Motor Starter and Bendix Drive.

Either outboard or inboard Bendix are furnished. The following table shows the motor weight and torque with different engine piston displacements:

Engine Piston Displacement	Battery Voltage	Torque at Standstill	Weight In-board	Weight Out-board
200 cu. in.	6	12 ft. lbs.	20	22
350 cu. in.	6	14	26	29
550 cu. in.	6 or 12	21	30	33
600 cu. in.	6	22	43	—
1,000 cu. in.	6 or 12	31	37	42

To meet the requirements of the varied demands of automobile manufacturers the Bendix drive is made in several standard sizes in both right and left hand models. An inboard application is where the gear moves toward the starting motor when meshing. With the usual position of the starting motor alongside of the engine, ahead of the flywheel, this requires a left hand drive.

An outboard installation is where the gear moves away from the starting motor when meshing. Fig. 4. With the usual position of the starting motor this requires a right hand drive. With the outboard application an outboard bearing is required.

The Bendix drive is divided into two classifications: The "Large Hollow" and "Small Hollow" types, with an added "Special Small Hollow" type. The "Large Hollow" type, R-13 or L-13, is mounted on an armature shaft .802 inch (nearly 13/16 inch) in diameter and is used where such a large starting motor is required.

The "Small Hollow" type, R-12 or L-12, R-11 or L-11, is mounted on a shaft ⅝ inch in diameter and is the type of drive for general purposes.

The "Special Small Hollow" type, R-10 or L-10, is mounted on a shaft ½ inch in diameter, and is used where the special conditions warrant.

Considering the motors alone the efficiency of the single unit set as a motor is lower than that of the motor alone of the two unit sets. This is on account of the greater amount of material subject to losses, the friction of the idle commutator and to the fact that the design is somewhat a compromise between what is desirable for the generator and for the motor. The relative figures are 76% and 74%. Considering also the gearing efficiency, the net efficiency from the motor terminals to the engine shaft is in the one case 68% and in the other only 45%, most of the loss in the latter case being due to the gears. This is a rather serious matter since the cranking speeds with a given current output would be in the same ratio as the efficiency. Thus if the single unit set turned the engine over at a speed of 100 R. P. M., the two unit outfit with the same current would give a speed of 151 R. P. M. In other words, the use of the double or triple reduction gearing leads to a great loss in efficiency. Where a starting motor may be geared to the flywheel at a ten to one reduction the generator would be geared at a one and a half to one reduction.

Summing up for

Operation: The single unit set as ordinarily arranged has a slight advantage.

Weight: For the same cranking speed and the same generator output the two unit outfit is probably 20% lighter.

Efficiency: The efficiency of the single unit set is less than the two unit set.

A Bright Repair Method.

From A. E. Ludwig, Illinois.—The gasket at the front of my differential housing became "chewed" up, probably from loose bolts, permitting grease to leak through. It would require at least ten hours work to take down parts and substitute a new three-cent gasket. I cleaned the parts with gasoline and smeared the joint with a paste made of litharge and glycerine which hardened over night, and have had no more trouble.

Lack of ideas in your think-tank will retard your business just as lack of fuel in the gas tank will stop your car.

Connecticut Farmers Find Trucks Useful

How Two "Land-Poor" Farmers Owe Their Success to the Motor Truck and Rewarded Their Faithful "Hired-Man," the Collie Dog

BY W. L. ALMY

DOWN in the lower part of the Connecticut Valley where the wooded hills rise on every hand, there is a small village of perhaps eight hundred inhabitants composed of farming folks and the owners of a few necessary stores. In the warm summer evenings one could visit the old corner grocery store and see typical Yankee farmers, tipped back in old wooden chairs upon the piazza, smoking clay and corncob pipes, discussing politics, religion, crops and the war, indiscriminately. During the long winter evenings this same "old guard" may be found sitting around the air-tight stove in the grocery store itself.

Usually during the winter time the air is blue with smoke and all of the groceries taste and smell of this aroma. Whether it is winter or summer the topic holding the most interest is that of the war and sooner or later the talking always drifts round to the fact that the farmer is the fellow who is doing the most to assure victory. These old Connecticut farmers generally have some pretty good ideas and it is certainly interesting to listen in to an evening's conversation.

Two of the men who hold the most attention usually, do not happen to have very many years back of them. They are brothers and own an extremely large farm within a few miles from the village. Their farm is situated upon one of the green hills and their old farm house looks down upon the village far beneath it. Ten years ago these boys ran about barefooted and helped their uncle milk the cows and gather the eggs. Today they own a farm together, and are considered among the wealthiest of the neighborhood. Their success is much greater than many of the older farmers who have been content to till their soil in the good old-fashioned way.

Almost Bankrupt.

Five years ago or just before the outbreak of the war, these boys found themselves in a rather precarious position. They held the title of the farm while a number of other farmers held mortgages upon different parts of it. With the outbreak of the war, the hired man problem began to crop out and the boys saw that unless they did something quickly, their farm would belong to someone else and they would be thrown out upon the world to earn their livings.

They worked from sun-up until darkness prevented them from doing anything more. They did not have time for vacation nor did they have time to attend church on Sunday. The taxes on the farm together with the interest on the mortgages ate up about all they could earn, and the only clothes they had were overalls and rough shirts made for service and not for appearance.

By the time they had weeded one garden the weeds in the other fields were weeks old. When they came to harvest their crops in the fall they found that they had undertaken an impossible task. Many of the potatoes were left in the ground and the fodder corn left standing in the fields. Oftentimes they were forced to feed the milk to the pigs and turn the stock loose into uncut hay.

Their only helpmate was a collie dog and the poor collie worked just as hard as the boys themselves. He would herd the cows together at night, pick up any stragglers and chase them into the barn. The only assistance that he required was the removing of the bars at the field and the bars were arranged near the house. In the morning the collie would make sure that all of the cows were in the field before he had his breakfast.

He seemed to have a mania for watching the turkeys and never permitted them to go very far away from the farmyard. He raised great objections when the ducks chose to swim in the ice pond. He seemed to feel that this was going against all the laws of nature.

The boys themselves certainly had their troubles and though they hated to dispose of any of the farm, they decided that unless they could arrange some way to cultivate all of the land and harvest all of their crops they would be forced to sell a portion of their land. By a strange coincidence, they decided to visit the above meeting of the Yankees around the air-tight stove one night, the first time in many weeks, and this happened to be the evening when an enterprising truck dealer visited the town. When the boys arrived the truck dealer had the floor and in glowing terms was outlining the possibilities of this vehicle.

Like a stock salesman the dealer was showing that all a farmer needed was half an acre of land and one of his trucks to make a fortune. Of course the boys accepted his statements "with a grain of salt" but they began to see the light and decided to "take a chance" at a two-ton truck. For two weeks they bent all of their energies and spent their time in going among the neighboring farmers to obtain another mortgage on their already overburdened farm. They finally succeeded in scraping together enough money for a truck. This was early in July just at the time when the boys were worrying the most.

They had succeeded in hiring two transients who had helped plant the crops and the transients had moved along to bigger fields and more pay at Bridgeport. The boys knew that they would be unable to dispose of all of their

Digitized by Google

crops in the usual methods and had about all they could do keeping the weeds away and the crops growing.

The first benefit that the boys derived from the truck was a tremendous saving in time. Previously they had taken the milk to the nearest railroad station, a distance of slightly more than a mile from the farm. They rose at four o'clock in the morning, milked the cows, harnessed the horses and hustled down to the station. With the truck, however, they more than cut the time in two. The truck did not require any harnessing and it went considerably faster than the "old nag." Instead of missing the first train two mornings a week and losing considerable of the milk, they disposed of all of it.

A Fulton Motor Truck. This Particular Style of Body Should Be of General Utility to the Farmer as Well as the General Merchant or Small Manufacturer.

Disposing of Eggs.

Previously they had depended upon a traveling collector for the marketing of the eggs. At times the collector would go around once a month, other times, once a week. He was entirely undependable and the egg money frequently showed a loss. With the truck, however, they carried the eggs to Westerly, a small city about seven miles away and took the profit themselves. As they made this trip once a week they took the opportunity of bringing back their grain and other necessities. They disposed of two horses, keeping one for work in the fields, and when they needed any special field work they co-operated with the neighbors for a draft horse.

As a general rule they collected farm produce from the neighbors when they made their weekly trip to Westerly and in this way saved time for the neighboring farmers who repaid them by giving them a certain amount of labor in their own fields. When hay time came the boys thought that they were "up against it," to use a slang expression, but the problem was easily solved. They made a deal with three of the neighboring farmers and all of the farmers worked together to gather the hay.

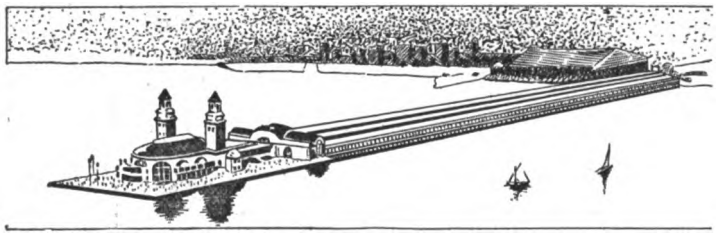
The hay was piled into the teams and the truck used to haul three of the teams to the barn where another set of men threw the hay into the mows. One man only was required to drive the truck and a constant stream of teams was kept running between the fields and the barn. All of the men working together harvested the hay in two days and then the boys used their truck upon the next farm where the procedure was practically the same. The truck replaced at least four horses and released at least three men for working in the fields.

The apple crop might have been a failure had it not been for the truck, for the very reason that the price of apples was so low that it hardly paid to market them. However, when the apples were taken to Stonington the

Digitized by Google

prices obtained were large enough to give a liberal margin of profit for the trouble.

The same thing was true of the peach crop, except that the peaches brought considerably higher prices and the main problem was to get them to the market before they spoiled.



The Collie's Reward.

The only one who did not profit greatly by the introduction of the truck was the poor collie. He still had his regular chores to do and perhaps was just as well satisfied. He did derive considerable pleasure, however, or seemed to at least, in sitting upon the truck seat "talking" to the engine. The boys have not as yet taught the dog to drive, but doubtless sooner or later he will be able to take up this branch of the work too. Nothing pleases collie so much as to be allowed to ride on the seat, or more literally, the dash, for he usually has his nose about six inches ahead of the machine most of the time, and he seems to be willing to run about the farm all day provided he can get a ride to the station, on the truck, in the morning.

GOVERNMENT APPROVES.

The Government Has Reserved Display Space at the National Exposition of Trucks, Tractors and Equipment, at Chicago.

THE Federal and various state governments have given their approval to the national exposition of trucks, tractors and automobile equipment at Chicago's Municipal Pier, September 14 to 21, by reserving display

space in which to exhibit war-time features of governmental work. The United States government will also, in all probability, take advantage of the thousands of visitors at the exposition to maintain a complete recruiting office on the pier.

With six weeks to wait before the opening of the greatest automotive exposition ever held, the management is already confident of establishing new records in every department. As a matter of fact, the number of exhibitors who had signed up for space by July 1 exceeded the total number of exhibitors at the exposition last year.

Last year's show, the forerunner of this exposition, was held at the famous Coliseum. It would take three or four Coliseums to house the 1918 war-time exposition. The Municipal Pier, being the largest exhibition place in America, is the only building large enough to accommodate an event of such magnitude as the truck, tractor and accessory exposition has already attained.

The entire northern section of the pier—a floor space half a mile long and about seventy-five feet wide, without a single obstructing pillar—has been reserved for display spaces.

The great auditorium, which seats 4,000, has been reserved for the meetings of hardware men the first two days of the week, and for the threshermen of Illinois, Wisconsin, Iowa, Indiana and Ohio on Thursday and Friday.

Musical programs have been provided for the exposition and, with the music of the Jackies' band stationed just across the driveway on the south side of the long pier, visitors to the show will have plenty of musical entertainment.

The Pier is very easily reached from any railway station or hotel in Chicago. The surface cars all give transfers and make direct connections for the Grand Avenue line which runs clear out to the end of the Pier, almost a mile from shore. Automobiles and taxi-cabs use the broad concrete roadway, while the street cars run on elevated tracks. The north shore bus line stops at Grand Avenue within easy walking distance of the Pier, and no one need fear that it will be difficult to reach the exposition. The Pier is just outside the "loop," but it is the easiest place in Chicago to find because all Chicago is justly proud of its $5,000,000 recreation center and show place.

THE RATTLED KING.

By WALT MASON.

"MY kingdom for a horse!" he yelled, the king who once a scepter held. His frantic cry has won renown; by poets it is written down, and it is thundered on the stage by actor kings of every age.

Why was his royal nobs so sore? Why did he put up such a roar? His touring car had broken down, and he was nineteen miles from town. He knew not how to make repair, so he could only stand and swear, and cry, "Oh, harken to my rede! I'd give my kingdom for a steed! For I am sick of choo-choo carts; they're only made to break men's hearts, and put the whole world on the blink, and drive poor dippy kings to drink.

"Ods fish! Gadzooks!" the monarch cried, "How happily I used to ride, on my old swayback sorrel mare! I traveled on her everywhere; she galloped, trotted, loped and walked, her carburetor never balked, she never called for gas or oil, however hard she had to toil, her steering gear was always true, in age she was as good as new.

"But since I got a motor car I never travel very far; the differential's out of whack, or else a tire splits up the back; I'm always paying hard earned scads to husbandmen and other lads, to haul my bumboat back to town,

Digitized by Google

because the blamed thing's broken down. And so I stand and chew the rag, and cry, My kingdom for a nag!"

Then came Sir Galahad that way; his car was running smooth and gay. His motor sounded slick as grease, and his brave spirit was at peace. He heard the monarch's doleful cry, and said, "My liege, 'tis vain to sigh. Why fool with that old tinhorn boat, which always gets your royal goat, when you might drive a Haynes, like me, and find your life a thing of glee? Why monkey with that punk old barge, which shouldn't be allowed at large, when you could shed your spirit's pains by driving round a Light Six Haynes? I never have a care or woe; my car runs sweet, where'er I go; it takes the highways as they come, and it is never on the bum. Get in my liege, and take a jaunt, and then you'll see the car you want."

The monarch rode nine versts or ten, and then he cried, "Oh, ne'er again will I go snorting o'er the plains in any wagon but a Haynes!"

Practical Suggestions from Mississippi

Our Happy Southern Friends Are Strong Competitors of the Connecticut Yankees For Ingenuity in Automobile Repair Work

BY JAMES F. HOBART, M. E.

IN most garages the practice is followed of using a box for containing the small pieces of the mechanism and a good deal of time is saved by having the pins, collars and other small pieces thus safely isolated from other jobs which might be in the shop. But still more satisfaction may be obtained, and a good bit more time saved, by using boxes of similar size and shape, and made as perfectly adapted as possible to the work they are intended for.

The box shown by Fig. 1 is about 20 inches long, 10 inches deep and 10 inches wide. In either end there is a till, made by rabbiting in two pieces when the box was made. The body of the box A was made of 13/16 inch cypress lumber, the tills B and C were of stuff slightly thinner, say ½ inch thick. It was suggested that these boxes be made of galvanized steel, but the garageman suggested that he had used steel boxes himself and did think they were good—until he tried a few. He summed up the business by saying: The wooden boxes don't last quite as long as the steel ones, but the latter are rattling abominations—always making a clatter and getting bent out of shape, and I do not care to have them in the garage. The wooden boxes are O. K., and if a man would spend a bit of time in binding the top edges and the corners with strips of metal, the boxes would be practically indestructible and last as long as the garage.

In either end of the box the tills B and C serve as containing places for the smaller parts of the mechanism. The till C is seen to be a bit wider than till B, and may be used for the coarser of the smaller parts, while till B is used for the nuts, washers, pins and set screws and other smaller parts of the machine. In setting up the car again, it is found very convenient indeed, and there is very little time lost in selecting the required pieces when setting up the automobile again after it has been pulled apart for overhauling or repairs.

While Tungsten contact points are not as good as those made of platinum, it cannot be contradicted that tungsten points last longer than those of platinum because they are so much harder. But tungsten points, in order to do good work, must be ground (you can't file 'em) perfectly flat and true, and in such a manner that the two opposing points will come together fair and square. Fig. 2 shows how the points should and should not be fitted.

In Fig. 2, the two points shown at E fit together so perfectly that scarcely a line can be seen at E, where the two points touch each other. This is the way the

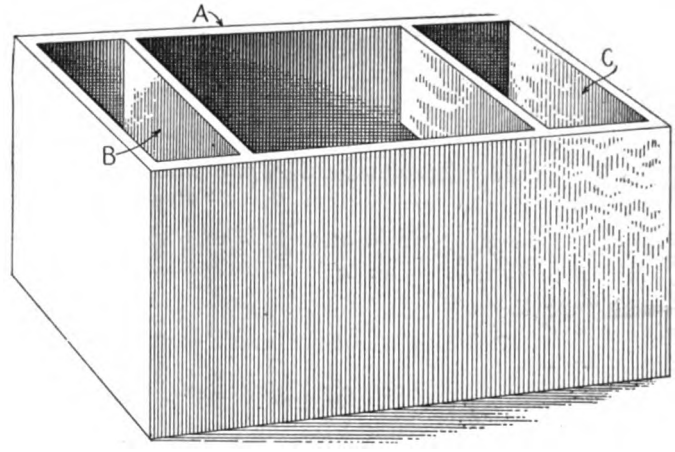


Fig. 1—A Handy Parts Box.

points should be fitted. But when points are left as shown at F, touching only at one side, there is every possibility that a weak spark will be the result of such fitting.

As stated, it is almost impossible to fit together by grinding two points and have them appear as shown at E, Fig. 2, unless the grinding be done in a well made jig which has been specially constructed for the contact points of the engine under repair. It is possible to fit points by repeated grindings and testing, but it is not a profitable operation and the mechanic is pretty apt to quit the attempt long before the points fit together as they should.

The contact points to be ground are shown in Fig. 2

Digitized by Google

at D and M. That at D being the movable point and mounted upon the lever N, which in turn is hinged at O. In grinding this point, it is absolutely necessary that the plane of the point-end shall lie along line (dotted) P Q, which passes through the center of pin O, and lies fair with the end-face of pin D. In like manner, dotted line P Q will pass across the end-face M of pin L.

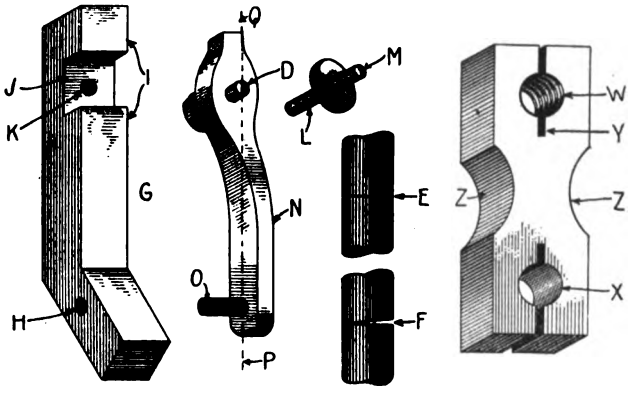

Fig. 2—Jigs for Grinding Points.

The jig G serves the double purpose of holding both pin and lever G and the movable point L M. To grind the lever-pin, slip pin O into hole H, then apply pin D to the grinding wheel or to the surface of an oil stone, if the grinding is to be done in that way. Then, the face of jig N will guide the point, hold it and lever N, fair and square at all times, and cause the grinding to be done square, no matter how much of pin D may have been worn away, for the shorter that pin may be, the more lever N will swing down, and as shown at E, Fig. 2, will always be kept squarely in line.

The grinding will of course cause some wear to jig G, Fig. 3, but if properly handled, the wear will be very slight and negligible for a long time. Eventually, a new jig will have to be made or a piece of metal soldered or welded to face I, so as to keep hole H directly in line with face I.

Grinding the Stationary Point.

For grinding point M, the pin L is simply slipped into hole K in jig G, the slot J having been made sufficiently large to permit the check-nut of pin L to enter the slot in question. Then the check nut is adjusted so end M projects slightly above the surface I, after which the pin is ground right down smooth with that surface and pin L will be found so square-ground that end M will fit perfectly against point D, when replaced in the auto mechanism.

If a bit of care be taken when using jig G to keep the surface I as it grinds away always in line with hole H, then the swing-lever point D may be ground indefinitely, but this scheme will not work with the stationary point M. The hole K must always be kept square with the dotted line P Q, in order to grind the end of L pin properly. A little care in using jig G will take care of the wear and the jig will last for years with a good deal of use. But, with a little carelessness, the jig may be put out of business in ten minutes.

By rigging bearers for the jig G, on either side of the grinding wheel, the jig may be made to last indefinitely, as all wear therefrom will be prevented. It is easy to arrange a guide for that purpose. A piece of metal with a hole in it may be clamped in place over the grinding wheel, the strip adjusted exactly level with the surface of the wheel by clamping it to the tool rest, then the jig G should be made long enough that it will reach across the width of the wheel and bear entirely upon the metal placed there to receive the jig. With this arrangement, the jig can be used until the holes become worn. There is no wear at all upon the jig itself.

Tool and Display Rack.

While in the shop where the point-grinding jig was found, the writer noticed a fine rack of shelves, then doing duty for the storage of tools and auto parts. But the rack of shelves had evidently been originally intended to be used in some exhibition.

The manner in which the rack was constructed proved very ingenious. The four corner posts R, R, Fig. 4, extended from top to bottom of the rack and each of the shelves were cut to a true miter, as shown at U, between the shelves S and T. Then the corner post was cut right into the end shelf S as visible at V, leaving the front side of each shelf and each leg flush and smooth as shown at U.

This form of construction proved very easy to handle and the stand or rack was easily put together in that manner with little trouble in obtaining good joints and solid connections between the legs and the several shelves which were placed about seven inches apart, thus leaving a trifle more than six inches clear, between each row of shelves.

Each end shelf was nailed firmly to the legs, then the front shelf was nailed both to the legs and the end-shelves, making a very strong and stiff form of construction. A strip of board not shown in the engraving was placed across the rear legs, near the bottom thereof, when the first or lower shelf was put in place. Then the top shelf was put in place and this, with the strip across the back, served to hold the construction firmly, not only during the setting-up, but afterwards as well.

This rack, placed against the wall, and loaded with tools and auto-parts, proved a very interesting and convenient piece of property which might be frequently used in shops or stores.

Run a Die Over Studs.

When taking a radiator off, some of the stud bolts came out, while others stayed in place and their nuts came off as was desired. But it was noted that the careful mechanic who was doing the job "freshened up" the stud threads before he replaced the nuts thereon. Those which stayed in place he treated by running the thread-

Digitized by Google

die over them. The die stock was not needed, a square die being used and turned by a wrench, a common monkey wrench being used for the work.

The stud which came out (because the nuts were stuck fast) had their nuts removed in a very simple manner. A square nut was selected which fitted closely to the thread of the stud. A cut was made with a hacksaw right through one side of the nut, after which it was screwed upon the stud, close to the end which should not have come out of its thread in the radiator foundation.

The vise was screwed tightly against the split nut, which was thereby forced against the stud thread hard enough to so hold the stud that the "stuck" nut could be removed. After that had been done, the stud was treated to a run-over with the die and was replaced in the foundation. The split nut proves a mighty good thing with which to hold studs and other screws upon which work is to be done and which are to be held in a vise. When work, either filing or polishing, is to be done upon a screw head, the screw may be securely held in the vise during the work by making use of a nut, split as above described.

Vise Clamps.

For holding round rods, pins, valve stems and "sich like," the garageman may easily make up vise clamps by drilling or reaming square nuts or bits of bar steel, until they will slide snugly over the round articles to be held. Then, by clamping the split smooth nuts around the object in a stout vise, the round shapes may be held securely and safely. It costs very little to make up a set of such vise-clamps, both for threads and for smooth rods, the clamps varying in diameter according to requirements of the work to be done, from one-eighth of an inch up to an inch or more, by sixteenths, or by thirty-seconds of an inch, as required.

Also, there should be both smooth and threaded vise clamps for the several sizes, and it would be well to make a case to keep them all in, something like a printer's type case will answer pretty well. One of these, a "cap case," will be found mighty convenient in the garage, not only for vise clamps, but for containing many other small things as well.

If you are willing to provide a little time and stock, you can easily make up a set of vise-clamps which will prove far ahead of the split-nut clamps in convenience and in utility. These clamps may be cut from bar steel, something as shown by Fig. 5. Thus, instead of using a nut for each size, and separate nuts for the smooth and threaded clamps, get out some pieces of steel long enough for two clamps as shown, then drill and thread hole W for a certain size of screw and drill hole X just large enough to slip over the body of the screw. It will be well to grind or mill out the sides at Z Z, thereby giving more spring to the steel between the holes W and X.

After the drilling, threading and grinding has been finished to suit, saw in at Y, at each end of the clamp, letting the saw run some distance below the holes as shown. This will still increase the spring-action of the clamp. After completing the clamp as above, be very careful to remove every corner and every vestige of roughness and sharp metal from the clamps. Indeed, it is well to put them into a tumbling barrel and let each and every corner be worn and smoothed off, after which the clamps are ready for use and the great efficiency and convenience of these appliances can only be fully obtained by arranging some means for keeping the clamps in such a manner that any one required may be instantly selected for use with absolutely no hunting therefor. If you lose time in hunting for things like these, then their efficiency is greatly reduced, if not entirely destroyed. Therefore, arrange some method for storing and keeping the vise-clamps so the hand may be placed at will upon any one. Then they will be efficient and worth having.

Cutting a Gasket.

The usual practice, when cutting a gasket, is to place the sheet of rubber or fiber over the surface to be fitted, hold in place with one hand and pound around the edge

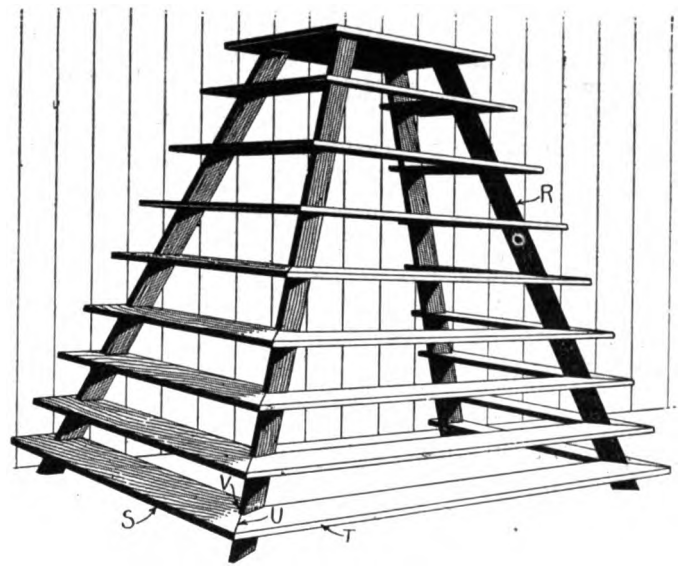

Fig. 8—A Handy Display Rack.

of the casting with the first hammer you can lay hands on, then pull off the rubber around the body of the gasket and put it in place.

But that is not the best way. Place the gasket sheet in position, lay a bit of heavy metal on the gasket to assist the hand in holding it in place. Then select a small light hammer with a well rounded face and carefully hammer around the edges of the casting until the gasket is well separated from the excess material.

But the gasket is not yet ready to be put in place. Do not use it with the edges rough and ragged. Place the cut-out gasket on a smooth board and trim the edges with a very sharp knife, or, if you prefer, with a pair of scissors. A gasket made in this way fits well, does not collect dirt along its edges and with the light hammer there is less danger of battering the edge along which the gasket has been hammer-cut.

MISSING NUMBERS—Our readers are requested to remember that we are always pleased to re-send numbers which have gone astray in the mails.

MAY THE WORLD BE ILLUMINED BY THE LIGHT OF LIBERTY

The Arabian Nights' Tale of Alladin and His Wonderful Lamp Modernized

ONCE upon a time, in a fertile valley, surrounded by green hills and filled with golden grain, there lived a man whose first name was Alladin. Like the old Arabian, Alladin was shiftless and could not see the piles of gold around him—until—one day there arrived at Alladin's house a wonderful magician who imparted a secret to him and gave him a talisman, which Alladin had only to touch, to obtain wealth and riches.

Alladin simply mingled with his friends and amassed great wealth and his name stood for money. Alladin of this tale, did not live in Arabia, he lived in America and the wonderful magician was a tractor salesman who gave the opportunity to Alladin—his secret was—"Sell Tractors."

The Proposed Normal Tax on Gasoline Should Not Cause Us Much Worry

THE new proposed tax on gasoline and upon automobiles is exciting considerable comment, but we trust that it will be accepted philosophically when the people realize just what it means. What automobile owner is there who feels that he is not willing to support our boys at the front? Is it our place to complain because the Government asks for our support? Is it our place to complain when the boys on the other side are sacrificing their lives? Even more than that, many of these boys are sacrificing their business and their glowing futures for the cause.

We should be proud of the fact that we are able to furnish the money. What is your automobile worth to you? What is your home worth to you? What is your business or all of your property worth to you if germany conquers? Absolutely nothing!

Consider this tax as an investment which will bring you 100% dividends. The more money we pay, the more men we put upon the field, the sooner we will win the fight and then our troubles will be over. Every time you pay a tax of any sort, remember what France is doing!

Everyone Should Be Loyal, Help Us To Spread the Feeling of Patriotism

WE publish an automobile magazine and it is our intention to make this magazine the best on the market. We feel that you agree with us when we say that there is no magazine which gives as much real mechanical information, or to use the slang phrase, "good dope," as the Automobile Dealer and Repairer.

At times we feel that we are badly handicapped in our editorial pages. We are torn between two forces. We want to be patriotic and at the same time we do not want to be misunderstood by our readers. Patriotism today should be the ruling factor and we willingly bow to this force. We trust that our readers will bear with us, if in our editorial pages we happen to give considerable space to our patriotic expression.

We are not on the fence, neither are we neutral. We are for America, and we try to do our part in arousing public sentiment for America. We mean to express this sentiment so thoroughly that should the villain of Potsdam read our editorial pages he would be ready to consign us to the fate of the defenseless Poles and Belgians.

America must win the war and every civilized person in the world today should be made to realize that the fight is between civilization and barbarism. We appeal to our gentlemen readers, to our subscribers who are real men and who do not agree that the bayonetting of children is royal sport—to fight the hun and his creed.

Let every sentence that you say contain the American spirit of ability and courage. Spread this courage through your community. If you meet a pacifist or a half-hearted American, bring forward some of the facts about the war. Make his blood boil with these facts. You don't have to hunt very far to obtain these facts. Read your daily papers.

Read of the sinking of hospital ships, the slaughter of stretcher bearers in the field of battle, the abuse of the American captives in german prison camps. Call the attention of your wives to the german atrocities

Digitized by Google

practised upon their defenseless women captives and the peasants of Belgium. Preach Americanism and civilization in your pulpits. Spread this doctrine so widely that the question arises, "How can we afford NOT to fight?" and put your argument so strongly that no single voice brings up the question of WHY do we fight? Add your voice to the general clamor for victory.

America wants peace. We want peace, but we don't want peace until we are sure that hunism and vandalism is buried so deeply that its ghost can never frighten our children in the future. We want peace so badly that we will sacrifice all of our wealth if necessary to conquer germany, for only in this way can we secure peace. German promises to us will be just as valuable as they are to the Ukraine. We want peace—but we intend that VICTORY shall come first!

Fight for Freedom !

Two Articles To Be Published That Every Car Owner Should Obtain

EVERYONE who reads this magazine will notice the leading article which presents the service truck in an entirely new light. Surely every reader will enjoy reading about the "Patients and the Diagnosis," our leading article for next month; all about the sick cars, their numerous ills and troubles and how to be the physician to your own automobile. The story will tell you of the "various diseases," their "symptoms" and how to "diagnose" them, in fact—but read it, then you will appreciate it the more.

Above all, don't fail to read our first October article entitled, "The Undertaker and the Graveyard;" it reads like a story, but it contains some real "honest to goodness" mechanical information.

You can get these numbers of the magazine free if you care to—read the 15 months for $1 subscription offer. Like the moving picture theatre, we announce,

"Coming: The Patients and the Diagnosis."

"Coming: The Undertaker and the Graveyard."

One of the Big Things That Automobiles Have Done Toward Winning the War

WE feel safe in saying that the great success of the Allies can be traced directly to advanced engine design. This means that those countries which are fighting for justice are more advanced in the science of automotives, both as regards land vehicles and airplanes.

The motor truck has been an important machine, its descendant, the tank, has been more important, while the airplane, both figuratively and literally, has soared high above. Supremacy in the air means success in war, and it is our superior knowledge of machinery that has enabled us to produce superior airplanes. And when we say "our," we refer to the Allies.

The civilized world owes much to the humble automobile. In this machine we find the nucleus of mechanics. Those nations which produced the best automobiles, now produce the best airplanes, because their people are educated in automotives.

Our young American "fighters of the air" owe their ability to their familiarity with the automobile. At the present time, hundreds of mechanics are needed, men familiar with gasoline engines, and our country can produce this sort of men, because so many of our people own automobiles and know how to operate them.

One Way of Conserving War Materials Is to Employ Substitutes Wherever Possible

IF you are a repair man you should realize that the price of leather is going up very rapidly. The reason for this is that this product is badly needed for army shoes, leggins, etc., and you should be governed accordingly. When one of your customers comes into the garage and asks you to re-upholster his car, don't suggest that it be upholstered in leather. There are many grades of imitation leather on the market today which are practically as good in every respect as real leather.

These fabrics resemble leather and wear as long if not longer than the real product. Imitation leather fabrics are easier to work with than leather skins. Much of a skin is wasted in cutting, whereas imitation leather may be had in various weights and lengths. Imitation leather is pliable, and does not age or crack upon weathering. Aside from the fact that you will be doing a favor for your customer, you will be doing a loyal deed for the boys at the front. They must have shoes or they cannot win the war and every year that the war is prolonged your expenses will increase.

Conservation—If You Read This Magazine Thoroughly, You Won't Need Any Other

WE don't care whether you are a dry-goods salesman or an automobile owner, whether you are an actor or a machinist; you should read this magazine. Perhaps you think that our statement is rather broad, but we have a reason for our lavish claims. Our magazine is original; if you don't believe it, turn to our first story and read it through. Don't you think that this article is different from anything you have ever read? Even if you are not interested in things mechanical, doesn't this little story appeal to you?

We try to have our whole magazine appeal to our readers in the same way. There are two ways to write a mechanical story. We might fill the book with a lot of mechanical facts and long rows of figures; items that would give even a machinist a headache to read—but—that is just what we won't do. We make every mechanical article, a story, easy to read, yet containing mechanical facts and suggestions.

The Metal Turning Lathe

Part 1.—The Metal Turning Lathe Is an Essential Tool in the Modern Repair Shop and This Article Tells How To Install It

BY J. F. SPRINGER

THE most useful of all power-driven tools used for cutting metals is the turning lathe. There may be other power tools which the repairman will have to purchase before he invests in a lathe, but they are not many. He may have to buy small tools and perhaps a drill press before installing a lathe. However, small tools cannot be used to turn and shape metals, while a lathe will do a large percentage of the work done on a drill.

An engine lathe has but few power driven parts. The spindle in the headstock is the principal one. Its function is to provide rotation for the work in order that a tool may be held against the piece and metal removed. The work may be held on a face plate or in a chuck or between centers. In any of these cases it is the spindle that provides rotation. In fact, rotation of the work is, on the ordinary lathe, provided in no other way. The spindle then is a most vital part of the lathe.

Other moving parts of the lathe have to do with the lead screw. All the movements have to do with the feeding of the cutting tool to the work or the reverse. No rotations of the work are dependent upon the lead screw or related parts. Cutting tools are fed to the work, as a rule, either by the hand or by means of a tool holding device controlled by the hand. But whenever considerable force or great regularity of feed is sought, the power driven lead screw is naturally brought into service.

Relation of Lead Screw to Spindle.

Now it so happens that the lead screw is driven by the spindle or the mechanism concerned in driving the spindle. Moreover, in general, the rotation of the lead screw is absolutely controlled by the rotation of the spindle. The speed of the latter absolutely controls the speed of the former. Thus, when the spindle turns round once, the lead screw will turn round a certain definite number of turns—as three turns, two turns, one turn, or half a turn.

It may be gathered from the foregoing that the spindle and the lead screw are two vital parts of the moving mechanism of the lathe. This is true. If we are about to purchase a lathe, we will advantageously center a very large part of our attention upon these parts and the parts with which they connect.

The spindle is in the head stock and if it runs true and at desirable speeds, we know that a large part of the essentials of a first rate lathe have been covered.

In order that the spindle may run true and continue to do so in spite of wear, the following specifications should ordinarily be met. (1) The two bearings should be wide apart. If one wears faster than the other, the distance between the bearings will tend to minimize the effect upon the work. (2) The bearings should be broad. The inevitable wear will then be spread over a considerable surface with the result of lessening the depth of wear. This is what we want.

Figuring Spindle Speeds.

As to proper speeds. If the lathe spindle is driven by means of a cone-pulley, then the fastest speed will be secured when the belt is on the smallest step, and the slowest speed (in case there is no back gearing) when it is on the largest step. If there are four steps, we can very readily get a good range. Suppose the countershaft runs at 130 revolutions per minute (R. P. M.). It will not be difficult to determine the speeds of the spindle corresponding to the various possible positions of the belt.

Divide the diameter of the step of the countershaft cone-pulley by the diameter of the lathe cone-pulley and multiply the result by the number of revolutions per minute of the countershaft. Suppose, for example, that the smallest step of the lathe cone-pulley is 5 inches in diameter and that the corresponding step on the countershaft cone-pulley is 15 inches and that the countershaft speed is 130 R. P. M. We divide 15 by 5, giving 3 as a result and then multiply by 130. Then the spindle speed will be 390 R. P. M.

Let us now consider the slowest speed. Suppose the two steps have diameters of 7 and 14 inches, the countershaft cone being the smaller this time. We first divide 7 by 14, giving .5, then multiplying by 130 we find that the spindle will run at 65 turns per minute.

These speeds may be suitable or they may not. Note that the fastest speed is six times as fast as the slowest. We can't change this relation between the fastest and the slowest without changing the lathe or countershaft cone-pulleys. See Fig. 1.

However, if we simply want to make all the speeds of the spindle faster or all slower, we may do that without altering either cone-pulley. We may simply arrange to run the countershaft itself more rapidly or more slowly. We may do this by using a smaller or a larger simple pulley on the countershaft to correspond with the pulley on the line shaft.

It is important to have the speeds of the lathe right. If the lathe cannot be slowed down sufficiently, we may expect difficulty or loss of time. Similarly, if it cannot be speeded up to the proper point.

If the slowest and fastest speeds are both right, then

Digitized by Google

we may rest fairly content. The maker of the lathe will naturally arrange matters for suitable intermediate speeds. A four-step cone will give four speeds. For general use in an automobile shop, four speeds will be sufficient. Five steps will only serve to enable the workman to change a little less abruptly from one speed to the next. However, if the shop is going to do work where very slow speeds are required as well as the faster ones, then it may be well to consider the added expense of installing a lathe fitted with back gearing.

Back Gears.

Back gears arranged at the head stock of the lathe provide another set of speeds. If we have a four-step cone, then with back gears we can obtain four slow speeds in addition to the four fast speeds. We have a complete new set of speeds. The back gears may be so arranged that we get a reduction of say one to eight. Or, it may be stated that the back gear ratio is 8. Either way, the meaning is the same. The new slow speeds are one-eighth as fast as the old fast ones without the gears. That is to say, we get a new slow speed for every position of the belt on the cone pulley.

It will be one-eighth as fast as the speed for the same position of the belt with no gears used. In the example, we had before, the slowest speed was 65 R. P. M., obtained at the time when the belt is on the largest step on the lathe cone. If the back gears are now brought into action and the belt remains in the same place, then the new speed will be slightly over 8 R. P. M. (that is, ⅛ of 65). When the belt is on the smallest step, we get instead of 390 R. P. M. the speed of about 49 R. P. M.

In selecting a back-geared lathe, an important matter is the jump from the fastest back-gear speed to the slowest speed without gears. In the present case we have about 49 for the one and about 65 for the other. That is a big jump. Unless we absolutely know that this jump will not be too big a one, it will perhaps be better to obtain a lathe with back gears having a ratio of 7 instead of 8. With 7 (or 1 to 7), we shall now have new speeds that are one-seventh of these of the old set. Thus, corresponding to 390 and 65, we shall get with the gears 56 and 9 (about). The jump from 56, the fastest speed, with gear to 65, the slowest speed without gear, is a reasonable one—one that is a very great improvement over the jump from 49 to 65.

Let me summarize some main points. If the lathe in contemplation is driven by a cone pulley and does not have back gears, then we shall have exactly as many changes of speed as there are steps on the cone. If the lathe is back geared, we get an additional set. Find out what the fastest speed on the lathe is and also the slowest, when the countershaft is rotated at the speed at which you propose to rotate it.

If the fastest speed is not fast enough, or the slowest not slow enough, then consider what to do. It is possible that a change in the countershaft speed may give you what you desire. Make the calculations, or get some one to make them, and see whether the fastest and slowest speeds will now be satisfactory. If not, then leave that particular lathe alone. Further, if you are about to get a lathe with back gears, find out what kind of a jump in speed is made when you go from the slowest without gears to the fastest with gears.

If it means a doubling or anything like a doubling of the speed, it will be well to consider before you buy.

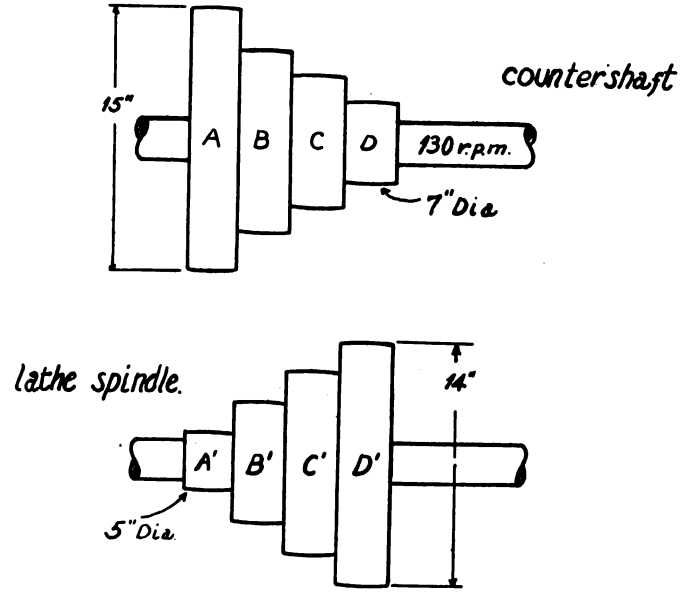

Fig. 1—Countershaft and Lathe Pulleys.

The jump may be a permissible one for you or it may not. At any rate, stop and consider. A back geared lathe costs considerable more money. It will be well to make sure you are getting what will prove satisfactory.

The speeds desirable on a lathe will depend upon the work to be done. Hard cast iron and tool steel will require comparatively slow speeds. Soft brass should be cut at a comparatively high rate of speed. Machine steel is properly cut at intermediate rates. We can vary the speed some, but not to a very great extent, if we propose to operate economically.

We must consider what kind of work we are going to do. If there is going to be a good deal of soft brass work of small diameter, then we will want some pretty rapid speeds. Soft brass should be cut at the rate of, say, 100 feet per minute. This means that the chip should come off at that rate. This is a different thing from 100 revolutions per minute. If the brass work on the lathe is 1 inch in diameter, then the chip taken off in one turn is about 3 1/7 inches long. To get 100 feet of chip, we will have to have as many turns as 3 1/7 inches go into 100 feet. One hundred feet is 1,200 inches. Dividing by 3 1/7 inches, we get 382 turns (about). If we want 100 feet of chip in 1 minute, then we will have to rotate the work fast enough to get 382 turns in 1 minute. From this is will be seen that the spindle speed of 390 R. P. M., mentioned a little while back, will not be too rapid. We obtained that speed from a countershaft speed of 130 and pulley steps of 15 and 5 inches on countershaft and lathe cones.

THE POOR MAN'S WAR.

The curbstone critic fished a 5-cent cigar out of his pocket and aired his views.

"It's not my war—or yours. It's a rich man's war. Let him fight it."

The man in the overalls with the dinner pail, who had stopped to wait for a car, butted into the talk.

"Where did you get that hunch, friend? My boss has two sons. Both of them are at the front. Neither could have got exemption if he had tried, and to give them their due they didn't try. Now take me. I've got three grown sons. One has a wife and two kids. He'll stay at home to support them. One works in a shipyard. He'll stay in this country. The third drives a truck. He'll go to France. You've got to show me before I'll believe it's a rich man's war."

"He's making money out of the war and we're paying for it, aren't we?"

"Some rich men are making money. Some aren't. I notice stocks are away down. That hits them. When it comes to paying for the war, I reckon we're all doing our share. The income tax and the supertax, and the excess-profits tax all hit him. It's the first war I ever heard of where the capitalist pays his proportion. Of course the workingman pays, too. I pay on tobacco, and the wife and kids pay when they go to the movies. That's right, too. They're not necessaries. I like to think I'm taking a wallop at the kaiser every time I light up. No, sir; the rich man hasn't any monopoly on this war. It's my war, too."

And the man with the dinner pail swung on to a car so as to get home to work in his war garden.

Concerning the Heart of the Automobile

The Automobilist Should Familiarize Himself With His Machine and Thoroughly Understand the Battery

BY WM. H. STEWART, JR.

IT is a very peculiar fact but true nevertheless, that a hard-headed business man will invest two or three thousand dollars in an automobile and then cease to take necessary precautions in safeguarding his investment. Such a man may be likened to a minister who invests in mining stock without trying to learn anything about the stock market or the output of the mine.

A man who owns an automobile should familiarize himself with the machine if he expects to drive it himself or even ride in it. Last night as I walked down Broadway, near Times Square, I noticed a crowd of people gathered around a large car, the price of which is well over $2,000. The owner apparently was driving the car himself and evidently was in trouble, so I stopped to see the reason for it. At the time, his car was in the middle of the street, all of the lights were out and the man was evidently pressing on the starting button and getting absolutely no response from the engine. To add to the man's confusion, the traffic officer arrived upon the scene and scored him heavily for driving the car with no lights.

The man protested, saying that it was not his intent to break the law but that the electrical system had evidently failed. Naturally, this made little or no difference to the traffic officer, and I do not doubt but what the man was, or eventually will be, hailed into court and fined for breaking the law. I claim that the man was entirely to blame because he did not know his car. In fact, he didn't have any suggestions. The only thing that he did know how to do was to press on the starting button. Naturally the engine would not start because the whole electrical system had gone wrong. The man suffered and so did the storage battery.

If the man had been wise he would have traced the wiring from the storage battery to the ignition switch, since it must have been that the trouble was along this line, else all of the system would not have failed. At the switch, all of the wires branch off to distribute the current to the various lights and the ignition unit. Since all of the lights and the unit failed, the trouble must have been between the distributing point and the battery itself, but since the battery operated the starting motor. the battery must have been in condition, going to show that the wiring was at fault.

This wiring could have been traced inside of three minutes and the trouble averted, had the man educated himself.

Storage Battery Important.

The storage battery is one of the most important units of the car, yet it is a device which seldom receives the proper attention. All that the average car owner knows about this unit is that it requires a certain amount of distilled water occasionally. I have often seen storage batteries in use that did not receive even occasional attention. Literally, they were starved to death.

The electrolyte, unless it is replenished frequently by the addition of distilled water, will drop below the upper

Digitized by Google

edges of the plates, cause excessive sulphation, and result in lost capacity. The general tendency is to blame the battery for the trouble. In the first place every new car owner should test his battery at least twice a week in order to familiarize himself with the conditions existing on that particular car. If the charging rate of the generator is high or if the starting motor is used excessively, the electrolyte will be dissipated rapidly, thus requiring frequent additions of water.

The storage batteries upon some cars, particularly those that are used steadily during the daytime and only occasionally in the evening, may require an addition of water twice a week, some batteries only once a week, while still others only twice a month. All of the construction books make a strong point of this fact and if the owner cares to protect his investment, he will spend the time himself or be sure that his hired mechanic will take care of the battery.

The Heart of the Automobile.

The battery may be considered as the heart of the automobile and when it fails the automobile stops. Storage batteries today are badly abused. The owner jumps into his automobile, pushes on the starting switch and waits for results. At times he waits for three or four minutes before the engine starts. He seldom makes sure that there is gasoline in the carburetor or that the ignition switch is turned on.

When an engine is in good condition it will start within fifteen seconds. If it does not, then the operator should locate the trouble before he abuses the storage battery, for continued use of the starting motor means the abuse of the battery. When the starting button is pressed, as much as 200 amperes of current may be drawn from the battery. This means excessive chemical action in the battery and if continued any length of time, the battery is sure to overheat. Continued abuse soon results in a damaged battery. The plates will buckle, the separators will disintegrate, and the electrolyte be boiled away or dissipated in the air. The active material is driven from the plates and falls to the bottom of the cell, resulting in decreased capacity.

Sooner or later the battery becomes a useless piece of junk unless it is used carefully. Excessive use of the storage battery is one extreme. The other extreme is had when the storage battery is used but little and the car used much. Every time a battery is charged and discharged, a certain amount of the active material is driven from the plates and falls into the basin at the bottom of the cell. We have seen that if the discharge is rapid, much of this active material is thrown off. If, on the other hand, the battery is excessively charged, the same thing will result in a minor degree.

Suppose for instance, your car is operated for ten hours a day, the engine may be started in the morning and operated until evening, then put into the garage until the next day, the only current drawn off from the battery is for ignition purposes and occasionally starting. You have noticed that the ammeter indicates anywhere from 5 to 15 amperes charging current. This means that if the battery has been fully charged, current is still driven through it and necessarily the plates are slowly but surely used up. The electrolyte, too, in this case is dissipated into the air. The specific gravity of the electrolyte at any time will indicate a full charge. In other words, your battery is just like a wooden pail kept full of water at all times. The pail soon is rotted away.

Rule for Long Battery Life.

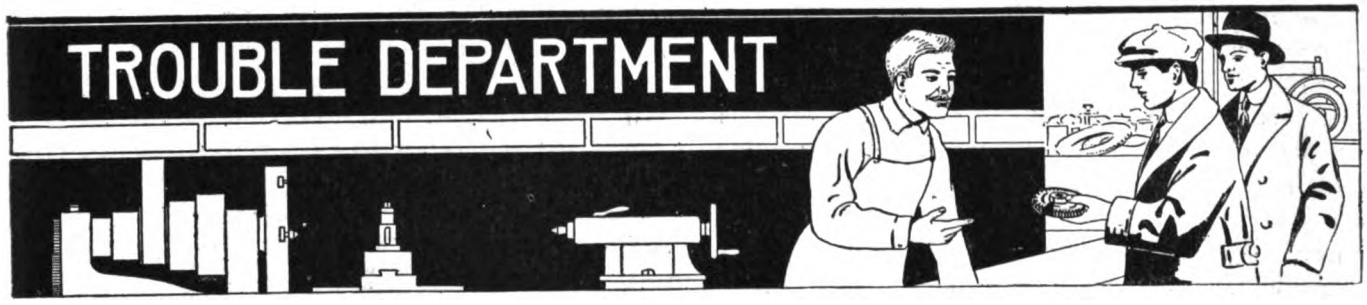
To secure long life in a storage battery, the unit should be charged and discharged frequently. If you should find that you are overcharging your battery, turn the tail light on occasionally during the daytime or even when you leave the car at night. This will serve to drain the battery slightly and keep it in condition.

Always bear in mind that your battery can be likened to a wooden pail. If it is drained too much it will be like a pail left in the sun; it soon falls to pieces. If on the other hand, it is kept too full, like the pail it will rot. Try to secure the happy medium by filling and emptying it occasionally.

There is one more point which might be made, and which few autoists realize, and that is the value of a storage battery charging station. The storage battery man's duty is to keep your battery in condition. He is the man who can "pour the water out of the pail and fill it again." Every time you pay the storage battery man fifty cents, remember that it is an investment which pays big dividends.

Don't let your automobile have heart trouble.

---



*President, Stewart Automobile School.

Are you teachable? Oh, I say, are you teachable? If you are not, then your wife and family and business associates deserve all the sympathy which all their friends can give them, for if there is anything that is nerve-wrecking, and happiness-destroying, and success-killing, it is to be continually associated with an individual who never learns by experience or observation or reading.

It is said that many people know as much when they are born as when they die, except for the few acquired arts of speech and locomotion. They simply are not teachable. You cannot tell them anything—they know it all. And the queer part of it is that it never dawns upon them that they are their own worst enemies. I pray you, whatever else your faults, BE teachable!

Poor Differential Adjustment.

2470

From W. E. Touhil, New York.—I have a Studebaker 1913 car, Model 25, and have trouble in breaking or stripping the bevel gear pinion or ring gear, one or the other. I have never had them stripped but once on a hard pull. The stripping usually occurs just as I start, or when I am running along on high. Clutch works very nicely. Can you give me any cause for this, and is there any way to overcome same?

Reply.—Your trouble in stripping the gears was probably due to the fact that the pinion gear did not mesh deeply enough into the ring or master gear. Examine the adjustment of these two gears and see that the pinion gear teeth mesh into the master gear teeth almost their entire depth. They should not mesh so deeply as to cause a grind, but they should mesh deep enough so that there is little or no back lash.

To adjust this, bring the gears together with their backs in line. You can tell by the feeling whether the backs of the teeth come together. You can bring them still further together until the teeth of the pinion gear bottom against the space between the teeth of the ring gear. Then back each gear away from the other about 1/64 of an inch. Fit a handle to the pinion gear shaft and turn it by hand. Listen to the gears and if they grind, back them away from each other a very slight amount until the grind stops. If you are unable to stop the grind, it is because the gears do not fit each other properly or are worn out. The only thing you can do in a case of this sort is to replace both gears or else to let them grind until they are worn out. The two points to be careful about are, first, not to have any back lash, and second, not to allow the gears to mesh too deeply. Be sure that the pinion gear bearing fits the shaft tightly. There should be no side play in either this shaft or the differential. If this car is not fitted with differential and pinion adjustments, the gears may be adjusted by placing thin bronze or fibre washers between the gears and the housings.

Low Tension Magnetos.

2471

From Joe W. Cobie, Iowa.—In an Overland car, model 41, 1911, four cylinder, the differential seems to lock every revolution, if one wheel is jacked up and the other left standing on the ground. If I drive in the mud when the wheels slip, it seems as if every time the power changes from one wheel to the other, a sharp jerk occurs in the differential. Are there supposed to be blank teeth on the small bevel pinions?

Can a low tension magneto like the Remy or Splitdorf be used successfully on a low tension igniter on a stationary engine? Would it burn out the primary winding if the current could not get back to the magneto every time that the armature was cutting the most lines of force? Do the igniter points have to be closed when it is not igniting? I am referring to an engine that has been used with batteries. I want to make a small wooden pulley on the armature shaft and run it against the flywheel of the engine. Please let me know how to fix it, if it can be fixed successfully?

Reply.—Your trouble with the differential is probably caused by broken gear teeth in the differential housing. We would advise you to remove this unit, clean it out and replace such gears as have been broken. There should be no blank teeth on the gears. It is impossible to say whether the small bevel pinion gears are stripped or whether the differential gears on the axles are stripped. The only way to tell is by inspection.

It is hard to say whether a Remy or Splitdorf magneto would give satisfactory results when used with a low tension coil for make and break ignition work. There are a number of things to be considered. The main point is that the break between the points in the engine must occur at the point where the armature winding is cutting the most lines, else the spark will be very weak.

The next point is that the breaker points in the magneto itself would probably be burned away very quickly. You would have to arrange it so that these points separated at the same time as those in the engine. However, you might remove the breaker box entirely or remove the breaker points and wire directly from them to the engine through the low tension coil. We doubt if the magneto coils would be burned out because current would be generated only while the breaker points were together, and the machine will not generate any more current than is needed. The armature winding is heavy enough to stand considerable of an overload. In fact it will stand more than the magneto can generate. As a suggestion for the winding of this magneto, we would like to have you try the following:

Remove both breaker points in the magneto leaving the cam in place. Then connect the insulated portion of the

Digitized by Google

breaker box with the low tension coil. Connect the other low tension coil terminal with the engine breaker mechanism through a switch. Be sure to ground the magneto on the engine. You will have to drive the magneto either by gears or by a sprocket in such a way that the breaker points in the engine separate just at the time when the armature winding is cutting the most lines on force. The spark will occur at the time when the ignition points separate and the points should be separated during that portion of the stroke in which the engine is not firing.

Starting on Reverse.

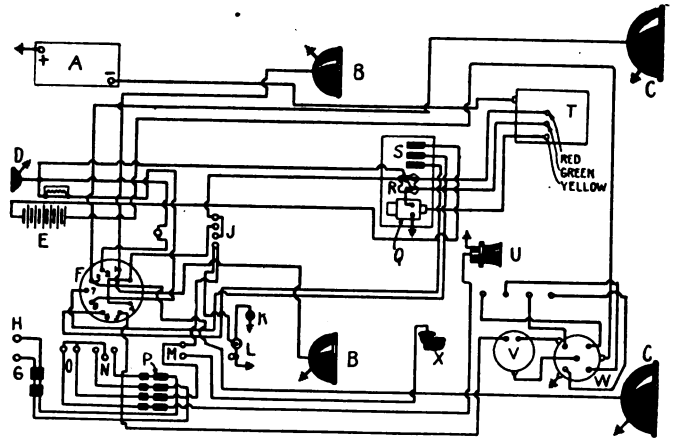
2472

From Harvey M. Wineberg, Pennsylvania.—I have been driving a few cars with three speeds ahead, and one reverse, and when I have stopped on a hill with a dead engine I was able to start the engine again by shifting in reverse gear and allowing the car to run backward a few feet, then letting in the clutch. The engine would then start on reverse. With a Ford car I have never been able to start the engine on reverse, backward down a hill. I have asked a few men that run Ford cars about this but could not get any information. I would like to know why the Ford engine will not start in reverse with the car running backward down a hill just the same as any engine in other automobiles, and would thank you very much for any information I can get on this question or on the Ford transmission.

Reply.—The reason why the engine cannot be started in this way is because of the fact that with the reverse ratio the momentum of the car is not great enough to turn over the engine. The power required to turn the rear wheels with the reverse gear engaged is a great many times larger than the power required to turn the engine over with the hand crank. If the hill were steep enough and the wheels do not break, the engine could be started. If you will notice some time when you throw in the low speed forward on a slight grade, the car will be stopped before the engine is started and the low speed forward gear ratio is considerably lower than the reverse gear ratio.

Faulty Ignition System.

2473



From Lorenzo French, Wyoming.—I have a 1914 Ford that is awfully hard to start. It is equipped with a Rayfield carburetor and I get good mileage. It pulls well after it is started and everything seems to be in good shape so far as I can see. What would you think is the matter with it? It has also a K W master vibrator, is wired for batteries too, but positively will not run on them. Why? Sometimes a little white smoke will come out of the breather pipe when the cap is taken off to put in oil. What does that suggest? Might it mean a broken or worn ring, and does it do any harm?

Reply.—We should advise you to examine the wiring of the car very carefully. Be sure that one side of the dry batteries are grounded to the frame and with the other side is connected with the proper terminal on the master vibrator. Be sure that the batteries give at least eight volts. The car is started easily upon batteries in warm weather. If you find that it does not, examine the carburetor float level and see that the gasoline level is not more than one-eighth of an inch below the needle valve outlet. If all the manifold joints, the valve stems, spark plugs and porcelains are tightly fitted and do not permit the passage of air through them, the engine will start easily. The reason for the smoke from the breather pipe is probably a leak in one of the pistons. It is hard to tell whether the cause is a broken ring or not. If the engine runs well and does not knock, we should advise you not to worry about the white smoke.

Cadillac Wiring Trouble.

2474

From E. G. Noth, New Jersey.—I have a 1914 Cadillac. The other morning in attempting to start the engine I found that the battery had run down. I had same recharged and in connecting it found that the armature of generator (Delco) started to revolve and continues to do so until I disconnect the battery, or wire to the generator commutator to the brush. Where is the trouble? The starter fails to turn the engine over. Is this due to the short circuit? Would it damage the generator to run it in this condition until arrival at a service station?

Wiring Diagram of 1914 Cadillac. Delco System. A, Battery; B, Side Lights; C, Head Lights; D, Tail Light; E, Dry Cells; F, Switch; G, H, Gear Shift Coils; J, Cut-Out; K, L, Hand and Gauge Lights; M, Horn Button; N, O, Gear Shift Buttons; P, Door Connections; Q, Regulator; R, Cut-Out; S, Ignition Relay; T, Motor-Generator; U, Horn; V, Coil; W, Distributor.

Reply.—Undoubtedly there is a short circuit in the wiring of your car, and we would suggest that you examine the wire leading from the ignition switch to the motor generator. We doubt if any damage will be done to the engine by driving same to the nearest service station.

What we think has happened is, that either through some fault of the ignition switch or because of grounded wire, the ignition line is turned on at all times when the batteries are connected. As soon as the generator commences to operate, an automatic switch inside prevents the current from running through it. A wiring diagram is given herewith and we would suggest that you compare it with the present wiring on your car.

High Tension Magnetos.

2475

From J. H. Gittens, West Indies.—Will you be good enough to send some information, by return mail, to a far away subscriber who takes much interest in your publication, and looks forward to each new copy from which he gains very useful information?

Recently there has been in our garage two magnetos, each with the same trouble, one of these a Simms, and the other a Bosch. Both were four cylinder high tension. These magnetos gave a fair spark when the armatures were rotated, but when placed on the respective cars they run for only a few miles, stop, and pick up again.

We have put them through all the tests at our disposal and tried out the tests for a broken armature wire, as prescribed in one of the issues of the Auto Dealer and Repairer. We found a deflection on the ammeter from the interrupter point test but none from the collector ring test. The Simms magneto, however, after being put through the foregoing tests, seemed to get new life, and ran the car splendidly for two days afterwards, but is now just as bad as ever. Please tell us what is wrong and if we could remedy same, and by what means?

We also have a 12 volt dynamo, with which we want to charge storage batteries. Please let us know what horsepower motor, of 120 volt alternating current would be required, what would the of same be, and what regulating device we would require when charging 6 volt batteries?

Reply.—Your trouble in both cases is probably due to punctured insulation upon the secondary coil winding. Under the test it is very possible that the heat generated by the passage of current through the wire melts the insulation to a certain extent and for a time prevents the passage of a high tension current through the winding or to the base. However, as soon as enough current is generated in this winding, the spark under tension short circuits. The only remedy is to remove the high tension winding in both cases and replace it. Before doing this, however, we should advise you to test this winding very carefully with a telephone receiver and a very weak cell. If there is a break in the winding, you will get no current through it and it will be safe for you to replace the armature. Make sure that the secondary winding is connected with the collector ring.

The writer has in mind a Simms magneto which he repaired some time ago in which the secondary wire had broken away from the collector ring causing intermittent action.

In answer to your second question relative to the power required for operating a 12 volt dynamo. As you do not say what the output of the dynamo is in amperes, we cannot tell you, but can give you a formula for finding it yourself.

We will assume that the dynamo generates ten amperes, then at 12 volts it generates 12 times 10 or 120 watts. An electrical horsepower is approximately 746 watts, and you will find that to generate 120 watts it will require 120 divided by 746 watts or slightly over .16 horsepower. The only regulating device which you would need would be a generator cut-out, and if you paid proper attention to the machine while it was in operation you would not need even this. This device is so arranged that when the dynamo stops the cut-out breaks the circuit and prevents the batteries from discharging through the generator. A hand switch would answer the purpose if you were careful to throw the switch off before you stopped the generator. This device should not cost much more than ten dollars and you may find that you can remove one from an old automobile. Generators cost anywhere from ten dollars up to two or three hundred, and you should be able to obtain a two horsepower electric motor for about thirty-five dollars.

Main Bearing Trouble.

2476

From A. R. Frank, Nebraska.—Will you kindly tell me what is the common cause of a knock in Ford cars? It is a sort of a hammer knock and occurs when the engine is running idle at good rate of speed, when under heavy load, and when at high speed. After having installed over-sized pistons the car was run about 2,000 miles and again overhauled. The main bearings have been tightened, also the connecting rods, the carbon removed, valves adjusted, and the pistons are still tight. After having run about 20 miles the same knock could be heard, getting worse continually. The bearings were tightened up by an experienced mechanic. Do you think that the oil not feeding properly might be the cause?

Reply.—We doubt very much if your trouble is due to poor lubrication. In our opinion your trouble is caused either by a loose flywheel or wrongly adjusted main bearings. If the flywheel is loose on the shaft, the knock will be noticeable while the engine is running idle, but will not be noticeable in high speed when the car is going up a slight grade and the engine is "pulling."

If the knock grows worse while the engine is working hard, indications are that there is trouble in the main bearings. Are you sure that the main bearings are lined up properly? If one of them is out of line, the crankshaft will knock at every revolution. The knock will be very heavy and resemble a carbon knock. If the knock is sharp and metallic, make a careful examination of the connecting rod bearings. After new bearings have been installed, trouble frequently develops and the bearings must be tightened again. Sometimes it requires five or six hundred miles to work the bearings into place for they are not fitted very carefully in the first place.

If after following the above directions you still have trouble, advise us and we will write you again. Be sure to tell us just what you have done.

Don't be afraid to mix a little generosity with your economy. It will help hold your patrons. Nobody likes to do business with a tightwad.

Maxwell Gear-Set Trouble.

2477

From Ray H. Weikel, Pennsylvania.—I have a 1917 Maxwell. I have had the second gear stripped and replaced it with a new one, but when I go up hill it will fly out. The gears all look all right. The only thing that might be the trouble with it is that the shaft isn't quite in the right place. How much valve clearance has a Maxwell car?

Reply.—We do not see how the gears may be placed wrongly upon the shafts and are pretty sure that your trouble is located in the gear shift levers. Remove the gear-set cover upon which is mounted the gear-change lever. You will notice that the gear shift yokes are attached to sliding shafts. These two sliding shafts are operated by the gear shift lever and each of the shafts have one or two grooves cut in their ends and into these grooves fit pins held in place by coil springs in the cover. When one of the shafts is pushed so as to mesh one of the speed gears, the spring pin drops into the groove so as to hold the shaft in place. Your trouble will be found at this point. The groove in the shaft may be worn round. The pin may be worn smooth or the spring may not be strong enough.

Regarding the valve clearance, the distance between the valve stem and the tappet should be adjusted so as to permit the insertion of a business card while the engine is cold. This distance varies from .003 to .005 of an inch when the engine is cold.

Excessive Vibration.

2478

From George H. Pike, Massachusetts.—Will you kindly help me by giving your opinion as to what would cause excessive vibration of mud guards and the entire front of my Ford car. This was overhauled in winter and only run about 300 miles since. Before it was overhauled everyone remarked how free from vibration it was when running idle, but now there is a decided vibration. Would faulty timing do it? It does not sound good when I get up to about 28 miles an hour, but a repair man says it is O. K.

Reply.—We doubt very much if your trouble is due to faulty timing. The timing of the engine should be in the order of 1-2-4-3 and if you connect the wires up any differently from this, the engine would not run on all four cylinders. Your trouble may be due to any one of a great number of reasons. We would suggest that you remove the engine from the car and go all over it again. Weigh each one of the piston and connecting rod assemblies. If one of the piston and connecting rod assemblies weighs a few ounces more than the rest, or if no two weigh the same, you must find some means for balancing up the various assemblies. Each assembly should weigh within a fraction of an ounce of the others, or the engine will vibrate.

The main bearings must be lined up properly. In replacing the pistons you may have more compression in one cylinder than any other. The flywheel must be centered up properly. If you have replaced any part of the transmission or left out one of the triple gears the engine will vibrate. In testing out the engine, proceed as follows:

Remove the engine and transmission unit complete from the car. Remove all of the pistons and connecting rods as well as the cylinder head. This will leave the crankshaft and the transmission assembly in place. Mount the engine upon your work bench and so arrange it that you can turn over the crankshaft very rapidly. You might arrange to turn it over by means of outside power. If the engine vibrates while it is being run in this way, remove the transmission unit, leaving the flywheel and crankshaft in place. Try the engine again. If it still vibrates your trouble is in the flywheel or the crankshaft. If it does not vibrate your trouble is in the transmission. If it does not vibrate while the transmission is in place and the connecting rods removed, we believe that your trouble will be found in the pistons and due to the fact that one or more of the pistons do not balance properly.

Gasoline and Tires.

2479

From Myron Roller, Ohio.—Does gasoline cause inner tubes to rot?

Reply.—Gasoline or oil will cause inner tubes to depreciate very rapidly. Either of these two liquids will rot rubber and cause as much depreciation as actual damage in many cases. Many tire manufacturers claim that the reason why tubes or tires do not give satisfaction at the present time or mileage is due entirely to the fact that gasoline or oil is brought into contact with the rubber while the car is standing in a garage.

A Peculiar Skip.

2480

From F. B. Konhaus, Pa.—I have a 1917 Ford that has been run for about a year. It has developed a miss and we cannot locate the trouble. I have had competent mechanics tear down the engine, clean, regrind and reseat valves, etc. We have tried all new plugs and all new dash coils, carburetor has been removed, cleaned and examined. In fact we have done everything we know of, tried different grades of gas, etc.

The trouble is not constant, as sometimes it runs fine for ten or fifteen miles, but most of the time it has, not a full miss, but just about a fourth of an entire miss. This, like all Ford engines, leaks lubricating oil in front cylinder. What is the cause of this and which is the best remedy, over-size piston, over-size piston rings or non-leak rings? Compression is good and equal on all cylinders. The car has not been run over three thousand

Digitized by Google

miles. We have tried about everything we know to remedy it, and any information you may be able to give will be greatly appreciated.

Reply.—We should advise you to examine the timer, for usually intermittent engine action can be traced to timer trouble. In fact the only way to be sure that the trouble is not in the ignition system is to install a new timer and new ignition winding.

We know of no way to prevent the oil leakage in the first two cylinders of a Ford engine, unless you install over-size pistons and leakproof piston rings.

There is one experiment you may try, though we cannot vouch for its effectiveness. If your trouble is bad you may try changing the oiling system in the following manner. In the first place the Ford oiling system is different from anything else on the market. Oil is fed to the timing gears at the front of the engine through a tube from the flywheel, where the oil is pumped by centrifugal action into a funnel-like cup upon the end of the tube. All of the oil reaching the various splash pans must first pass to the front of the engine through this pipe. Our suggestion is that you bore small holes through this pipe over each connecting rod pan and fit a plug into the end of the pipe. Through this plug bore a small hole to supply the timing gears with oil. A little experiment will enable you to determine the size holes to use. In this way you will distribute the oil evenly to all of the splash pans. This is only an experiment, however, and we cannot vouch for it. It is a personal suggestion from the writer.

Removing Carbon from Studebaker.

2481

From James Ruis, Michigan.—What is the best and easiest way to get at, clean the carbon out, and grind the valves of a Studebaker 4, seven passenger car?

Reply.—First remove the secondary wires, then drain the radiator and remove the top water jacket manifold feed which is fastened to the top of the block by studs and nuts. With this removed you will be able to remove the plugs in the tops of the cylinders in which are mounted the water jacket manifold studs. Then remove the spark plug and priming cup valve covers, and you will have two holes in each cylinder through which to work for scraping out the carbon. The valves may be ground after stuffing a piece of cloth in the cylinders to prevent the grinding powder from reaching the cylinders.

Third Brush Regulation.

2482

From George F. Mims, South Carolina.—Will you please let me know if there is any way to increase the charging rate of the generator on my Overland 90 car? I use the car principally around town where starting is frequent, and the speed too slow to keep up proper generating power. Can any adjustment be made in the third brush, or is there anything I can do to give me slightly more current in the battery?

Reply.—The charging rate on any third brush regulated generator may be increased by adjusting the third brush in the direction of armature rotation. The charging rate may be decreased by moving the third brush in the direction opposite to the direction of rotation.

Connecting Rod Knock.

2483

From D. Fay Davis, Oregon.—I drive a 1918 Studebaker four, and in climbing a hill that is rather long there is a knock in one of the cylinders. It sounds as if it were in the piston of the third cylinder. I do not think it is in the crank. What would cause the knock? Changing the spark does not seem to help much. After running for about 20 minutes, should smoke come out of the breather pipe? The engine is getting oil all right. What kind of oil is best to put on a cone clutch?

Reply.—We are of the opinion that your trouble is due to a loose connecting rod or a loose wrist pin, and would advise you to inspect these two parts of the engine. Before doing this, however, clean out all of the carbon in the cylinders. The reason for smoke coming from the breather pipe may be one of two things. Either there is a leakage past the pistons, or more likely a certain amount of the oil is vaporized by contact with the hot pistons. If the engine is getting plenty of oil you need not worry about the smoke from the breather pipe. There is but one kind of oil suitable for a cone clutch. This is called "Neatsfoot Oil" and may be purchased at practically any drug store. After cleaning the leather fabric thoroughly with kerosene oil and a stiff brush, rub the Neatsfoot oil into the leather very thoroughly until the leather is soft. If the clutch is faced with Raybestos, multibestos or any of these types of fabrics, we would advise you to consult a service station before putting any oil on them.

E. M. F.-Adjustment.

2484

From R. J. Kefferly, Illinois.—I have an E. M. F. 30 car and have much trouble with the rear axle. At present there is an awful growl and howl. It is all right in first, second and reverse, but in the third speed it sounds as though the ring and pinion gear mesh too closely. This is not the case, however, as I have examined it thoroughly. Could it be possible that the clutch engages too far into the flywheel, as it is very hard to release? When I ease the clutch out a trifle it seems to help reduce the noise.

As it is now, the clutch when fully engaged is inside the outer rim of the flywheel at least ¼ to ⅜ of an inch. The bearings, ring gear and pinion all seem to be in good condition, but I am at a loss to account for this trouble. I have made adjustments on torsion rods as the rear axle

Digitized by Google

would jerk forward upon starting the car. I had an idea that this would cause the axle to get out of line. It sounds as though when making a revolution in reaching one spot the ring gear causes the noise.

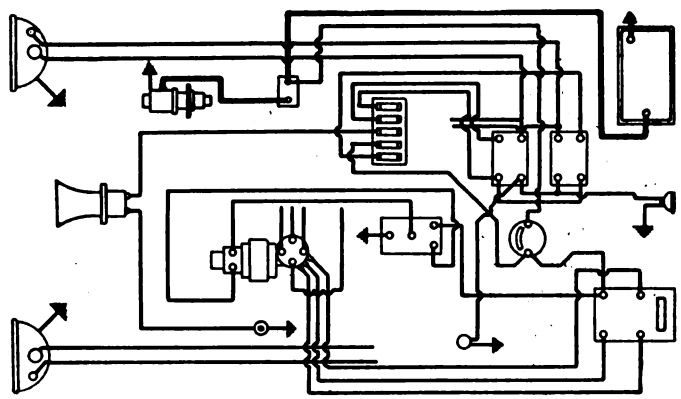
Reply.—We are of the opinion that the master gear or differential housing is out of line and we should advise you to inspect this part of the car again very carefully. It is very possible that the pinion gear bearing does not fit the shaft properly. Again it may be that there is too much side play in the differential. We do not think that your trouble is in the clutch. The correct way to test the differential is to remove the axle from the car and fit the pinion gear shaft with a handle by which you may turn the unit by hand. If the wheels are in place you can very easily adjust the differential to the point where it makes the least noise.

Ford Ignition System.

2485

From G. J. McQueen, Oregon.—I want to ask a question in regard to the Ford ignition system. A friend and I were talking over the different types of ignition and the "Hunk-a-tin" variety came up, and what really struck us was this: The magneto is an alternating generator. Is it not? And the coils are vibrating coils. Then why is it necessary to have the vibrating coils? Would not a non-vibrating coil do the stunt, or is there a reason for using the coil they do. We have asked several garage men or rather fellows who put in their time at such places and we have not found anyone who can give us any satisfactory answer. Can you give us any light on the subject? We are not electrical experts although we have a common working knowledge of gas engine ignition.

Reply.—It is very true that the current generated by the Ford magneto is alternating but the difference between the alternating current generated by the magneto and the ordinary alternating current such as we are accustomed to in lighting systems is considerable. As you doubtless know, the high tension secondary current is generated when magnetic lines of force are cut or interrupted. In other words, every time the current in the primary winding of a coil drops from maximum to minimum and increase to maximum again, secondary current is generated. This is the first fact to be considered. The second fact is that the passage of electrical current takes a certain amount of time.



With these two facts in consideration, let us see what happens in an induction coil through the primary winding of which is being passed an alternating current. First, we will assume that the current alternates sixty times a minute, that is, that it is 60 cycle. There will then be sixty fluctuations in the secondary coil. Let us increase the fluctuations in the primary coil to 120. We will get as many fluctuations in the secondary coil, but the interval between the fluctuations will be only half as great as they were before. Suppose we increase the cycle up to 1,000 or more. The current will hardly have time to pass through the coil before it is changed to the opposite direction and the effect upon the secondary winding will be greatly retarded. One fluctuation will overlap the other and neutralize it to a certain extent so that the secondary spark will be very weak in comparison with what it would be were the primary current to be 60 cycle or less.

We have another fact to contend with and that is residual magnetism. Unless the iron is extremely soft, the core of the coil will resist such a rapid change in polarity. It may be said that alternating current of such high frequency as that produced by the Ford magneto has an effect upon an induction coil similar to that of direct current. This is why a vibrator is necessary.

Wiring of Allen Car.

2486

From L. F. Hardesby, New Mexico.—Will you give me through your next issue a wiring diagram for the

Wiring Diagram for Allen Model 37, 1916.

Allen car, Model 37, 1916, with a Westinghouse generator, two brushes and ignition unit combined?

Reply.—The wiring diagram of the Allen car is reproduced herewith.

The Meaning of A. L. A. M.

2487

From A. Kohler, Ohio.—What does A. L. A. M. mean in its different uses? It is used on dies, bolts, wrenches and also in rating motor cylinders. Please give the form of rating the horsepower of a given cylinder.

Reply.—These letters stand for "American License Automobile Manufacturers," and was a society consisting of various automobile manufacturers who were trying to standardize automobile parts. Their work has been continued by a later society called the "S. A. E." Society of Automotive Engineers. These societies have undertaken to standardize bolts, nuts, screws and automobile parts, and originated the horsepower formula

Digitized by Google

used as a basis for finding the horsepower of gasoline engines. This horsepower formula is as follows:

Multiply the bore of the engine by itself and multiply this product by the number of cylinders. Then divide by 2.5. For instance, assume that a four-cylinder has a bore of three inches. To figure the horsepower of the engine, multiply the bore by itself, making 9. Multiply the 9 by 4 cylinders, making 36, and divide by 2.5, giving 14.4 horsepower.

Bosch Magneto Magnets.

2488

From W. E. Baker, Minn.—Will you kindly advise me, as one of your subscribers, how often, if at all, Bosch high-tension magneto magnets should be recharged?

Reply.—The magnets on this machine frequently last for many years and we can give you no rule for charging them. Unless the current from a storage battery is sent through the coils, the permanent magnets will retain their magnetism for three or four years at least.

Charging Battery from Generator.

2489

From O. C. Malmedal, North Dakota.—I have a 110 volt 9½ ampere compound wound direct current generator and would like to know how I could arrange it so I could charge a 6 volt storage battery.

Reply.—It would not be practical for you to charge one 6 volt storage battery from such a large generator unless you are able to regulate either the amperage or the voltage of the generator. If you can arrange to put in resistance between the generator and the storage battery cutting down the amperage to around four amperes you can charge the battery with it. The resistance, however, would use up considerable current and consume power, and as we said before, hardly advisable.

Testing a Cut-Out.

2490

From George Baum, New Mexico.—Will you kindly tell me how to test a cut-out, that is, how to determine the points where the device cuts out and cuts in? What size storage battery would you recommend for an automobile? What does the ignition relay do? Is the ignition relay the non-vibrating coil? What is the resistance wire for on an ignition coil or timer? What kind of a system is the Gray & Davis 1914 system? What system was used on the Chalmers Car? Is the Westinghouse single or double system? Will you decribe the Delco system?

Reply.—In order to test a cut-out, obtain a volt meter and start the engine. With the engine running at low speed touch the two terminals of the ammeter to the two generator wires leading to the cut-out and note the voltage reading. Have an assistant speed the engine gradually, until the volt meter shows six volts. Then note whether the cut-out closes at this point. The volt meter should not be left connected with the line but contact should be made at frequent intervals. If the engine is gradually speeding up, you will thus be able to note the voltage at which the cut-out makes the contact. In the same way you may find just when the cut-out breaks the contact. Should you desire to adjust the cut-out so that it makes the contact at 6.2 volts, run the engine at the speed at which the volt meter shows 6.2 volts and adjust the cut-out accordingly.

The size storage battery to be used for starting, lighting and ignition depends entirely upon the other units of the car. As a general rule the manufacturers are tending to adopt the six-volt three-cell storage battery, but as we said before, if the starting motor, the generator, or the ignition unit happen to be designed for 12-volt current, you will be obliged to use 12-volt battery. We cannot answer your question relative to the ignition relay, for we do not know what system you were using on your car. This device is designed to break the battery connections when the switch is placed upon the mag connections to prevent battery discharge.

In different systems this device is arranged differently and we can give you no more specific information. The non-vibrating coil is not the ignition relay, however.

The resistance wire on the ignition coil is designed to prevent excessive discharge through the coil should ignition switch be left upon the "on" position. As soon as you throw the ignition switch on, the resistance coil begins to heat and as it heats less current passes through it. If you should leave the ignition switch on over night, the coil would heat nearly red hot and prevent the passage of too much current. While the engine is running, contact is broken very frequently by the interrupter points and so the coil will not heat.

The Gray & Davis 1914 system would be termed a two-unit starting and lighting system. Upon the Chalmers car were used the following systems:

1914 Entz single unit.
1915 Entz single unit.
1915 Gray & Davis two unit.
1916 Entz single unit.
1916 Gray & Davis two unit.
1917 Westinghouse two unit.
1918 Westinghouse two unit.

The Westinghouse system may be either single or double unit.

There have been a great number of Delco type machines made. In every case the armature was of the shuttle wound type. In the case of the generator, but one winding was provided the armature. In the case of the single unit system, where the generator and motor formed one unit, the armature was provided with two windings as well as two commutators. One set of wind-

Digitized by Google

ings was connected in series for starting, while the other set of windings was connected in parallel or shunt, as you term it, for generating. In some types of Delco apparatus but a single field coil was used, while in other types two field windings were necessary. We feel safe in saying that practically every type of motor or generator has at some time been represented in the Delco apparatus. A complete description of Delco apparatus and the various types and windings would fill a rather large book, and we should advise you to obtain a good electrical book from the library or purchase Dyke's Automobile Encylopedia.

Some Light on the Electric Problem

A Little Story About Headlights, Amount of Current Consumed, and How the Combination Affects Business

BY WARREN S. WILLIAMS

THE noise that proceeded from the productive part of Hickey's Repair Shop indicated that business was in a fairly flourishing condition, even if there was nothing particularly suggestive of activity in the attitude of Hickey, the proprietor, who sat in his economy-sized office with his long legs stretched almost clear across it and his eyes fixed on the ceiling.

Hickey was vastly busy, however. He was too busy to care whether he looked the part or not, and that's one of the signs of genuine busyness. He was working himself into the proper mental attitude for writing a letter to a customer who wanted a whole lot of adjusting —downward, of course—done on his last month's bill, and he was going over the whole matter with reverse English. That is to say, Hickey was putting himself in the shoes of the customer and talking the thing over amicably with Hickey.

Gradually the somewhat tense expression of his rather grimy visage relaxed and he swung around, his chair—*the* chair—squealing dismally, and attacked the little model 1908 or thereabouts typewriter upon which the correspondence of the establishment was executed. Hickey was a one-finger-on-each-hand performer on the typewriter, but as the correspondence was not heavy, the 1908 machine and his two good forefingers were equal to the job.

Hickey had finished the letter, read and re-read it and appended a big signature and dropped the document into his pocket for mailing at lunch time when the street door opened and closed behind Bob Smith, of Smith Brothers, who sold the Speedix.

"'Lo, Hick. What's doing?" inquired the newcomer, briskly.

"Same as usual," grunted Hickey, scrunching his tummy against the desk to let Smith get by and occupy the box which served as a seat when there were two in the office. "How's things by you?"

"Middlin' only. Say, do a job for me, rush, quick, right away?"

"Guess so, if it ain't too darn big. What is it?"

(Smith Brothers had no repair shop, and they found Hickey's honest shop, which was just around the corner, exceedingly handy; Hickey treated 'em right.)

"Well——" Smith hesitated a little. "I sold a car to a guy a couple of weeks ago and he's had a little trouble that isn't altogether his fault, and I'm inclined to stretch a point and fix it up for him."

"Stretch a point, eh?" echoed Hickey, pricking up his ears. "What kind of trouble did he have that wasn't altogether his fault?"

"Lubrication went on the bum and he burned out a bearing. I don't blame him much because I told him the car was all right just as it came from the factory and he'd better not touch anything—or rather it was Billy that told him—and it seems the oil didn't feed fast enough——"

Hickey interrupted by projecting a No. 1 size forefinger in the direction of Smith's nose.

"'Nuff said. I've got you, bo!" he exclaimed, chuckling. "You're still harping on that 'knowledge is dangerous' notion and the darned harp has busted a string. Ain't that right?"

"Hick, you know just as well as I do, if you'd own up, that if you try to stuff a salesman full of technical information he'll think he's an engineer, and he won't sell cars like he'd ought to. I believe a salesman ought to sell cars, and that's enough for him. Even if he knew it all he'd get our owners all tangled up, and they'd blame us instead of blaming themselves for misapplying what might be perfectly good dope. I'm no engineer myself, and I don't want to be, and I don't want my salesmen to get the engineering bug. What's the use, when here's Hickey's little shop almost next door——"

"All bunk!" commented Hickey, contemptuously. "Nobody wants you to have high-brow engineers selling cars; there's such a thing as a happy medium, ain't there? I know just as well as you do, if you'd only own up"—Hickey grinned at the plagiarism—"that about every time anyone asks one of your men something about the insides of his car he gets next to nothing. Then I get 'em and get credit for knowing something, but there's darned skinny pickins answering questions over the telephone."

"I wouldn't put it just that way"—hesitated Smith.

"Put it any way you like," Hickey butted in. "The fact is that you don't know anything much about the in-

Digitized by Google

sides of a car and you don't believe in letting your salesmen tell anything even if they do know it, which they don't. When a man asks you people a perfectly reasonable question he gets a perfectly useless answer. I used to think I'd give up trying to argue with you, Smitty, but, darn it all, old man, you're overlooking chance after chance of making yourself solid with your owners and your prospects, only you won't see it that way."

Smith grinned.

"What's put it into your head that it's worth while to take another shot at saving me?" he inquired.

Hickey hesitated a moment.

"If I tell you," he said, "You've got to agree to keep everything connected with a certain incident strictly under your hat. I don't want it mentioned to the parties concerned, and if I tell you it'll be for the purpose of getting your goat on the principles involved, and nothing else. Is it a go?"

"Fine!" cried Smith. "Deep, dark and mysterious. Yes, yes. Go on. Your story interests me strangely. I agree to the conditions."

"Quit your kiddin'," said Hickey "You know those four 1914 Speedix Specials you're trying to get off your hands?"

"Rather!" said Smith, ruefully.

"A man called up your place the other day and said he liked the looks of the car, considering the price, and wanted to know what was the matter with it besides being an old model and tired of standing round in stock. Your man told him the main thing was that there was no electric equipment. So the guy says that suited him because he had a little shop of his own and he'd like nothing better than to put on his own starting-lighting outfit, if it could be done. 'Could it be done?' he says.

"Your man took a desperate chance and told him 'Sure it can be done.' Then the prospect, encouraged by your man's confident tone, wanted to know how much current a set of lamps would take, and how he could figure what the generator output ought to be, and stuff of that sort. He was one of those mechanical nuts, and he wanted to monkey with the car for fun—but the main thing was that he wanted to buy it first."

"Hm," said Smith, sternly eyeing the toes of his shoes. "What did they tell him?"

"The Lord only knows," replied Hickey. "All *I* know is that your man, seeing a sale balancing on the edge, yelled 'Wait a minute, and made a big rustling of papers and finally reeled off a string of figures that the prospect took down very carefully and took away with him. And he proceeded to try to make those figures work."

"Was it Billy that gave him that stuff or was it——"

"Hold on, hold on!" cried Hickey, with both hands in the air. "As soon as you get out of here you've got to officially forget every word of this or I won't tell you the rest—which is the real meat of the story."

"Oh, all right." And Smith resigned himself.

"Well, as I say, the nut tried to make the figures work, and that's what led to his getting in touch with me." And Hickey, complacent, paused to apply a match to the last 125 millimeters of what had been a cigar.

"O ho!" ejaculated Smith. "I thought there'd be something like——"

"Shut up!" ordered Hickey. "Applying your man's figures, the nut calculated that it would take an average of a little less than one horsepower for every lamp on the car, and he didn't like the idea of putting such a burden on the little Speedix motor. He was looking at that little old Terrier roadster I've been trying to sell and he thought it might suit him because it has more motor than your wagon. He told me what he was doing and asked me the same questions about the electrical stuff. I gave him the dope—the real stuff—and he figured it out on the spot, easy. He couldn't make the results jibe with the results he got from the other 'dawtah' as he called it, so I told him which was right and which was wrong. To make a long story short, he went away happy."

"Mind telling me who the nut was?"

"Nope," grinned Hickey. "Elihu Wesley Pragg, 773 Maple Avenue."

"Pragg!" echoed Smith. "No one can sell *him* a car!"

"Maybe not; but he's showed signs of being able to sell himself one."

Meditative silence for the space of sixty seconds.

"What's your way of figuring that stuff?" inquired Smith. There was a suspicion of sheepishness in his grin.

"You can figure," replied Hickey, calmly. "On a current consumption of one watt for each candlepower in headlight bulbs, and one and a quarter watts for each candlepower in the little bulbs in the side and tail lights and such. That is, a 16-candlepower bulb will take 16 watts and a 4-candlepower side light will take 5 watts."

"Easy! Easy!" muttered Smith, scribbling.

"All right." Hickey dropped to a lower gear. "If you want to know how much power the whole bunch of lamps will pull from the generator or the battery all you have to do is to add up the wattage of all the lamps. If you have two 16-candlepower headlights, two 4-candlepower side lights, a 4-candlepower tail light and a 3-candlepower instrument board light you'll have two sixteens—that's 32—three fives, which makes it 47, and the dash lamp which takes 3¼ watts—call it four to make an even number and you've got a total of 51 watts."

"Got it," said Smith.

"Well, 746 watts is the electrical equivalent of a horsepower, so you can see where Pragg sat up and took notice and felt better."

"Holy smoke!" exclaimed Smith. "Then the figures my man gave him must have made him calculate that the lamps would draw about—hm, hm, let's see—about—more than three thousand watts!"

"There or thereabouts," grinned Hickey. "That's enough current to drive an electric delivery wagon on a good road with a fair load."

Smith groaned.

"Suppose," he pursued, "You know how much current

Digitized by Google

you can get out of your generator, and all that, how can you tell what lamps to use?"

"You've got to know the voltage of your generator current. The lamps must be of the same voltage and the total wattage of the lamps must be not more than the capacity of the generator; ought to be a little less."

"But you've been talking watts," said Smith. "What d' ye mean, volts?"

"Volts is like pressure," instructed Hickey. "And amperes means something like quantity. You'll generally find generators marked with voltage and amperage. Multiply the two together and you get the watts, which is the amount of work the volts and amperes between them can do. And if you know the voltage of your lamps, which you can find out by looking at them, and if you know their total wattage, which I've instructed you how to find, you can tell the current consumption of each lamp if you want to. Do you want to?"

"Shoot!" said Smith.

"Multiply the watts per candlepower by the candlepower of the lamp and divide by the voltage and it's done."

"Much obliged, Hickey," said Smith, pocketing his notebook. "Though I don't know that you've made much impression on my principles. What did you say Pragg's address was?"

Without batting an eye Hickey dove into a pigeonhole.

"Here you are," he said, "773 Maple——"

"Good Lord, what's that—a check?" Smith's eyes were glued to a slip of pinkish paper pinned to the letter Hickey had produced.

"Oh, sure," said Hickey, calmly. "Didn't think I'd let him get away, did you? He bought that Terrier roadster, you know."

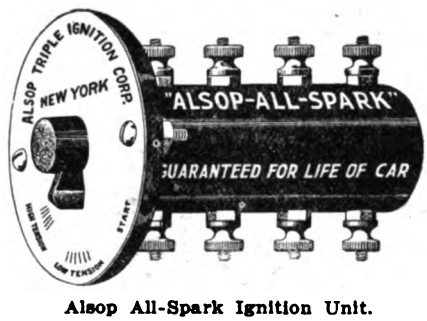
NEW AND INTERESTING THINGS IN MOTORDOM

Comer Auto Stop Signal.

This is an automatic safety device which is operated by the brake rod. In this issue of our magazine readers will find a full page in two colors describing and clearly illustrating this device which is an exceedingly clever and convenient one. If your dealer does not handle the Comer Auto Supply Signal send your order direct to the manufacturers, The Wonder Sales Company, 616-617 Hippodrome Bldg., Cleveland, Ohio, and dealers should write to this Company for their special dealers' proposition.

Flag Holders and Flag Staffs.

Every automobile owner today should show the national emblem on the front of his car, but he should be careful not to tie the flag in such a way that it can fall over or drop upon the ground. If he is not careful he may damage the front of the radiator, and so he should purchase a specially constructed flagholder which may be clamped upon the filler cap.



Such a device is manufactured by the H. K. Metal Products Co., 60 Grand Street, New York City. The holders made by this firm may be obtained in a great number of styles and sizes. The so-called "Liberty Line" of flagholders is very complete and may be obtained for carrying as many as seven flags at one time or for attachment inside the car, as they may be attached to any flat surface with two wood screws.

"Alsop-All-Spark."

This article is one of particular interest in these war times when economy is the by-word. It is a saving because by its use, action is immediate and permanent, and it is guaranteed to utilize the old, dead carbon choked spark plugs with as satisfactory results as can be obtained from new ones without this device. The advantage of the Alsop-All-Spark goes much further than the saving of spark plugs, as the reinforced spark is a more positive exploder of the gasoline.

When it is considered that there are as many as 5,400 sparks per minute in the average six cylinder engine which runs 3600 R. P. M. and that only a certain per cent explode the charge, it can be seen readily that a device which gives such a powerful spark that it will penetrate through heavy oil and spark dead carbonized plugs, will certainly cause a great deal more powerful explosion per spark delivered. In actual test an increase of 30% in gasoline mileage will show with its attachment.

In an official Government test by the war department a Ford car was filled with ten quarts of oil above the prescribed high level and with this oil it

Alsop All-Spark Ignition Unit.

could not be run more than fifteen minutes. An Alsop-All-Spark was attached to the same car, when all the plugs were dead, and the engine started off perfectly and was run for five hours despite the ten quarts surplus oil. At the end of the test the plugs were removed and found to be white and clean, as good as new, though the car would not have run fifteen miutes without the device.

It will never be necessary to change spark plugs on trips again as a slight turn of the dial on the dashboard will raise the voltage to such an extent that it will overcome any misfire, no matter what condition the plugs may be in.

Owners of cars who have trouble with oily cylinders, caused by loose piston rings or scored cylinders, will find this device will explode the gas in such form that the oil will not give any trouble and a $100 repair job can often be saved. This article screws on the dashboard, is controlled by a dial on the inside of the car and is connected between the spark plugs and distributor. It does not interfere in any way with the present equipment and is guaranteed to work equally well with any ignition system.

Dead Easy Tire Pump.

The Globe Manufacturing Company of Battle Creek, Michigan, manufacture a product termed the Dead Easy Tire Pump, which should be investigated by every car owner who desires an efficient tire pump. The Company makes a free trial offer and requests those interested to write for the pump for fifteen-day trial.

Indoor Ice Carnival Opens At Hotel Winton.

Although opened but a few months, Cleveland's newest hotel, the Winton, has already established itself as one of the most popular and complete in the country.

With its 600 rooms, all outside and each with bath, every appointment for the comfort and convenience of the guest is provided.

The ballroom which accommodates 1,000 persons comfortably is one of the most artistic in the country.

Of its restaurants, the Winton Rainbow room, with seating capacity for 1,000 people, has proved an enjoyable surprise to visitors. The novel arrangement of two large terraces which provides a clear view of the stage, unobstructed by posts, is most effective during the Ice Carnival, now in progress.

Ever alert for refined, enjoyable entertainment, the management has installed a skating platform of real ice. None but the most talented artists have been engaged, and those who have read or heard of Norval Baptie, the world's champion ice skater, will welcome this

Digitized by Google

opportunity to see him and his graceful partner, Gladys Lamb, in the Winton Rainbow room. The ease and grace with which they perform seemingly impossible feats on skates, is both startling and enjoyable to the audience.

Another artist who has been pleasing the country and is now at the Rainbow room, is Romayne. A niece of Billie Burke, Romayne learned her art of Charlotte and bids fair to succeed her teacher as the world's greatest ice skater.

Further diversion is furnished by Loos Brothers, excellent singers, who please with tuneful songs while whirling about on their skates.

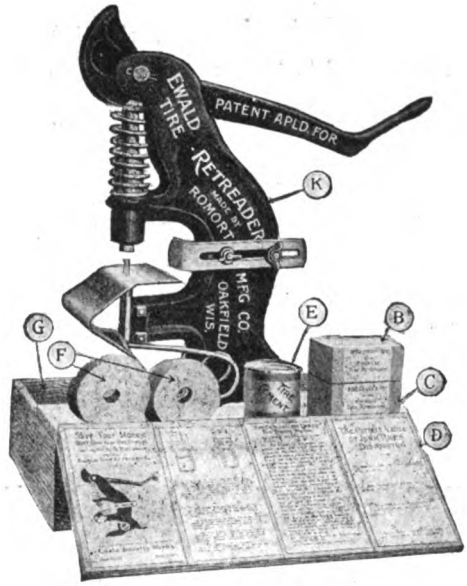
A novelty is provided by St. Pierre, a grotesque comedian, whose antics never fail to create laughter. Smith and Russo, two charming young girls, add further enjoyment to a most pleasing performance.

Paul Biese and his novelty orchestra, who for five years was the attraction at Chicago's famous College Inn, is now at the Rainbow room, where his music is an added attraction of this popular restaurant; Biese and his orchestra play both noon and evening.

Visitors to Cleveland will find the Hotel Winton a most delightful "home" and the Rainbow room a most attractive atmosphere of refinement and enjoyment.

The Stenman Electric Valve Grinder.

We are illustrating a new model electric valve grinder which has just been brought out by the Stenman Electric Valve Grinder Co., 42 Southbridge Street, Worcester, Mass. This model has many improvements which the earlier models do not have. Among these improvements are the following: A large handle giving a better grip and balance, switch in the handle at the finger tips giving perfect control, flexible steel conduit for connection wires, galvanized and insulated, impervious to oil and water, will not break or crack like ordinary cable, similar to that used on speedometers,

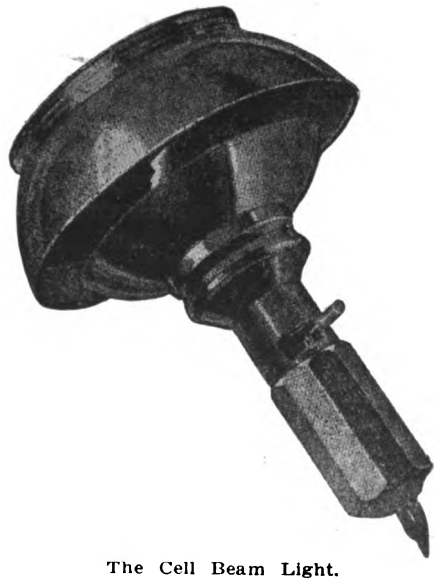


Stenman Electric Valve Grinder.

though lighter; separable attachable plugs of a special composition, detachable both at the handle and socket; all gears made extra heavy of phosphor bronze. This valve grinder meets all requirements and is strictly up to the times. No doubt many repair men who read this magazine will desire to equip with one of these grinders.

Ewald Tire Retreader Outfit.

The Government is requisitioning a large percentage of the rubber and it devolves upon the repair man to save all the tires that he can. In fact the car owner himself should investigate the Ewald Tire Retreader outfit which is be-



Ewald Tire Retreader Outfit.

ing sold by The Zinke Co. of Chicago, Ill.

This device consists of a retreading machine together with staples, cement, rubber reliners and full directions for use. The machine is so arranged that a new tread may be fastened directly over the old shoe. In this way the car owner is able to use old shoes that are almost ready for the scrap heap.

The Cell Beam Light.

We doubt if there is on the market at the present time another light of more interest than that manufacured by the Cell-Beam Mfg. Co., 1101 Bedford Ave., Brooklyn, N. Y. This device may well be said to have a thousand uses.

The Cell Beam Light.

It is a combination device and may be used as a search light, a spot light, or a trouble light. The light itself weighs less than a pound and may be clamped upon the car in any convenient position. When not in use it may be slipped into the side door pocket of the car.

The globe itself is surrounded by a specially arranged reflector which is designed to prevent the direct beams of light from projecting into the eyes of an approaching driver. At the same time, however, it diffuses a certain amount of light to render driving possible. It is finished in polished nickel and furnished with a high grade switch in the handle, together with eight feet of flexible cord and a 30 candle power mazda nitrogen bulb. The manufacturers have resumed the marketing of their product direct from the factory through the jobbing trade.

Another Vesta Improvement.

In our articles devoted to the storage battery in the past two or three issues, we have shown our readers that the capacity of a battery is proportionate to its plate area and in this issue we are calling the readers' attention to the fact that a plate depreciates in proportion to the amount of active material thrown to the bottom of the cell.

The Vesta Accumulator Co. of Indiana Ave., Chicago, Ill., announce that they have recently produced a porous hard plate to which they have given the trade name of "Poro-hard." By increasing the porosity of the plate more of the active material is brought in contact with the acid electrolyte. The result is equivalent to increasing area, for the active area is increased by the extreme porosity. While being exceedingly porous this new plate is not soft and spongy, so that it still has sufficient tensile strength to resist the electrolytic action and the manufacturers claim that it will have a longer life than the average plate.

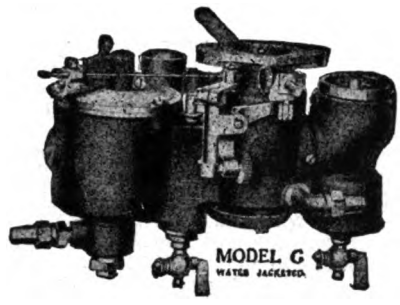
Stevens "Wartime Economy" Catalog.

At a time when the motorist and dealer are squaring up their purchases with wartime economy—avoiding frills and adhering strictly to accessories that make for increased efficiency and comfort in motoring—a catalog like that now being issued by the house of Stevens & Company, 375 Broadway, is of unusual merit and timely interest.

More than two hundred motor necessities are interestingly described in the new Stevens book which is replete with bright and informative illustrations. There are sixty-four pages devoted entirely to Stevens Products and among these, accessories for Fords are prominently displayed. A copy of this new catalog will be mailed to any dealer on request.

Tires At Low Prices.

The Service Auto Equipment Co., 951 Traders Bldg., Kansas City, Mo., is offering tires at low prices. They say that these tires are guaranteed for 6.000 miles with no seconds. A full line is carried of all sizes, non-skid or plain, and these tires are shipped prepaid on approval.



Trade Announcement.

When the General Tire & Rubber Company of Akron offered to the repairmen their latest type of quick repair patch for any make of cord tire, they had developed an entirely new type of patch.

ECONOMICAL

EFFICIENT

The Rayfield Carburetor has met every demand of the hour. The war has doubly accentuated its sturdy dependability.

The World's Best

The Rayfield earned its title because it

SAVES MORE GASOLINE
DEVELOPS GREATER POWER
DELIVERS MORE SPEED
GIVES MORE FLEXIBILITY

Rayfield made good because it is right in principle and right in mechanical workmanship, and because each model is at all points time-tested and tried—the public is never asked to experiment with an unknown quality in Rayfield.

The Carburetor which has stood the test of years is the one to which car owners now are turning for elimination of fuel waste and dependability in carburetor performance.

Order from any Rayfield Distributor, Jobber or Service Station, located everywhere.

Findeisen & Kropf Mfg. Co., 21st & Rockwell Sts., Chicago

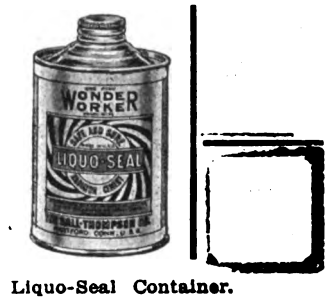
pressed during the last year with the necessity of handling cord tire repairs in a more advanced manner. Experimental work conducted by the General Tire Company developed this new type of patch made up with a special cord fabric thoroughly impregnated and cemented on the back surface with a cold patch cement.

Many of the vulcanizers have not yet secured sectional moulds which are large enough to handle six, seven or eight-inch cord tires now in use. They naturally appreciate the ease with which a reliable and substantial cord tire repair can be made by using Multi Cord Patches. These Multi Cord Patches are being furnished, one size for 3½-4-in. Cord Tire; one size for 5-6-in. Cord Tire, and a larger size for the 7-8-in. Cord Tire.

Counter Display For Raybestos.

We are illustrating a new counter display card which has been brought out by the Raybestos Co., of Bridgeport, Conn., to assist dealers in advertising Raybestos brake linings. One of these counter displays is packed in each carton of 20 boxes of genuine raybestos without wire, for Ford cars, but of course any dealer who is now purchasing or has purchased a quantity of this product from his jobber will obtain the rest of his articles to be supplied with a counter display free of charge. All inquiries should be addressed to the Raybestos Co., Bridgeport, Conn.

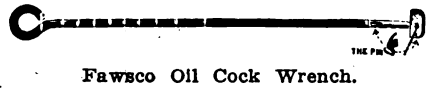


Raybestos Counter Display.

Kerosene Equipment For Fords.

The use of kerosene as a motor fuel is a live subject in which the public is keenly interested, especially at this time when gasoline is likely to be highest on account of Government taxation and from other causes. The Kerosene Equipment Company, Detroit, Michigan, manufactures a special kerosene vaporizer all ready to be attached to the engine of your Ford car. While gasoline is used in starting the car, even with this device, it is only for a very short period, just long enough to raise the temperature of the kerosene to a point that will properly vaporize it and hold it in suspension. To insure a perfect mixture a four notch adjustment is provided to satisfy conditions on engine and local climatic conditions. Those who have installed this apparatus are enthusiastic over the results obtained and readers who are interested should write direct to the Kerosene Equipment Company at Detroit, Michigan, for an illustrated circular, prices, and full particulars.

Liquo-Seal.



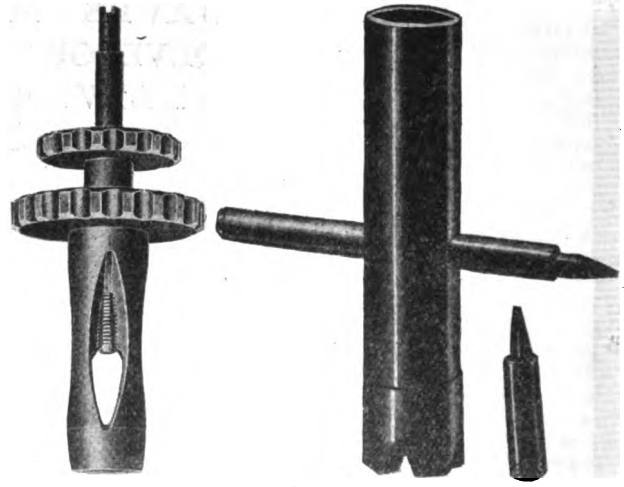
Nothing causes the motorist more annoyance than a leaky radiator, and the repair of this member often costs considerable, because of its peculiar construction. Liquo-Seal is a chemical composition which may be put into the radiating system and should leaks develop, the seal compound fills them. Upon contact with the air Liquo-Seal turns into a hard cement. The manufacturers, The Hall-Thompson Co., of Hartford, Conn., claim that this product will not clog up even the finest honey-comb radiators.

Liquo-Seal Container.

Oil Cock Wrench.

"The extension arm," as it well might be termed, is sold by J. H. Faw, Inc., 37 Warren St., New York City. The manufacturers term this device "the oil cock wrench" and gasoline gauge. As a matter of fact this device should be in the hands of every car owner for the very reason that it obviates the necessity of crawling underneath the car and soiling the clothes in order to find the height of oil in the Ford crank case. "The oil cock wrench" is used for opening the oil case cap on the Ford crank case and is fitted with a pin which may be used for cleaning out the various passages. All of this may be done without soiling the hands or the clothes. It is surely worth the money.

Fawsco Oil Cock Wrench.



A. & H. Tire Valve Tools Keep Valves Good.

Everyone in the automobile industry, whether connected with the branches that have to do with the cars themselves or with those which have to do with the thousand and one things that are collectively called accessories, is doing his part toward making the use of the car free from trouble and annoyance.

Most of the big troubles have been wiped out, and, for that matter, so have most of the little bothers, which latter class may be said to include tire valve annoyances, which are being vigorously pursued by the A. & H. Manufacturing Co., Inc., 505-507 West 45th Street, New York. This company manufactures the A. & H. True Threader valve tool, and to this it has now added the A. & H. Repair tool; between the two, it is stated, every trouble of a tire valve can be taken care of as long as the valve is in a condition to be made serviceable.

The True Threader is, as its name indicates, a thread-cutting tool of convenient size—a little more than 3 inches long—with which the smaller threads of a valve can be put into good condition. It has dies for threading the inside plunger and the outside nipple, and at one end is the fork required for removing plungers.

The new valve repair tool takes up the work where the True Threader leaves off. It is a little larger, for it will do the larger work on the valve; the length is about 4¼ inches and a T-handle makes it convenient to use. It will recut the large outside stem thread, remove the hexagon nuts, remove broken plungers and will ream rough nipples.

Two A & H Valve Tools

New Device Stops Gas Tank Waste.

Gasoline economy has never been so imperative as today, and with the recent announcement by the government of the tax to be levied on gasoline, every automobile owner is especially interested in its conservation.

Perhaps the greatest waste of gasoline has been the one least known—that which evaporates or is jolted through the vent hole of the gasoline tank. Conclusive tests at the Armour Institute of Technology and the Associated Engineering Laboratories have proved that this waste of gasoline can be stopped by equipping your car with an Imperial Gas Tank Seal. It works equally well with gravity or vacuum systems and is so simple it cannot get out of order. The valve admits air automatically, to replace gasoline through the carburetor. The Seal is easily installed in a few minutes—simply bore a ⅜-inch hole in the filler cap.

Fuel bills can be reduced from $12 to

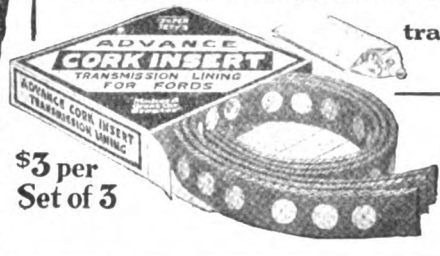
Stop that squeak
with
CORK INSERT BRAKE LINING
FOR ALL CARS OTHER THAN FORDS

SQUEAKING brakes are a nuisance. Car owners detest them. The public hates them. It's a sign of inefficiency, too, and a danger signal. Means hard, slippery linings—linings that may fail to hold in the emergency.

There's no longer any excuse for squeaking brakes. Cork Insert Brake Lining ***absolutely prevents squeak.*** It never gets hard or slippery. It produces smooth, positive braking action to the last mile of use.

Cork Insert Brake Lining also is grab and slip proof—***oil*** and ***grease proof.***

It gives ***sure*** control of the brakes and ***longer wear.***



Every time you hear a squeaking brake think of Cork Insert — ***it stops the squeak.***

Practically all jobbers handle Cork Insert—most garagemen and dealers in accessories sell it.

of its kind on the market, is made by the Imperial Brass Manufacturing Company, 1200 West Harrison Street, Chicago.

With or Without Water.

Any of our readers, who are not already familiar with Spee-Dee Cleanser, should get posted at once. This compound, which cleans dirty, greasy, grimy hands, with or without water, washes automobiles, trucks and vehicles, has been justly named the wonder of the age by users everywhere

Spee-Dee is needed by every motorist, every mechanic and every housewife throughout the land as it is said to clean everything and injure nothing. It is gritless, harmless and pleasant to use. Dealers testify that this necessity is a big seller, in fact one dealer states that he considers this the best selling auto-specialty on the market. One small town dealer in Illinois sold over five cases in one week. Remember, Spee-Dee is not a soap, not a powder and not a liquid, but is a speedy cleanser which does the work.

The confidence of the trade in the merits of Spee-Dee is shown by the above photograph showing a carload of Spee-Dee shipped to Supplee-Biddle Hdwe. Co., Philadelphia, Pa., one of the largest and most energetic hardware jobbers in the East. You can purchase Spee-Dee from your jobber. The manufacturers, the States Chemical Co., 616 West Austin Avenue, Chicago, say they will send dealers selling helps upon request.

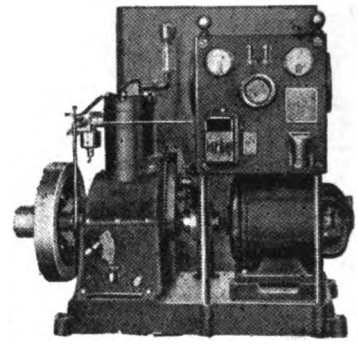
A Large Carload of Spee-Dee.

Electric Steam Vulcanizer.

The Consolidated Products Co., 1838 Central Avenue, Cleveland, Ohio, Department 12, are putting on the market a vulcanizer which is attracting considerable attention among garage men and jobbers. This machine is operated by steam, steam pressure being generated by electrical current. The feature of the apparatus is the automatic control. When the required pressure of steam is reached current is automatically shut off and should the pressure fall one point below the working point the current is turned on again. This regulation is so exact that the repair man is positive of results. He is assured that he will not overcure or undercure a tube or tire. There is no danger or fire hazard because there is no open flame. The only attention required is occasioned with the electric circuit. The manufacturers make liberal discounts to jobbers and the proposition should sell very rapidly because the device is tremendously practical.

Removal Sale.

Mr. S. Breakstone, the well-known Chicago dealer, is moving from his old location at 1526 Wabash Avenue, Chicago, Ill., to 1322 Michigan Avenue, in the same city. In connection with this removal Mr. Breakstone is offering a number of interesting bargains which will be found illustrated in our advertising columns.



Farm Lighting Plants.

An electric lighting plant for farm and country home use which has been attracting a great deal of attention for some time is the Type K Mayhew-Electric, manufactured by the Mayhew Company of Milwaukee, Wis.

Longer battery life and the elimination of engine trouble are two objects that appear to have been successfully accomplished in the design of this lighting set. Its outstanding features are simplicity of engine design and effectual control of the charging rate while the batteries are being charged.

The engine is of the 4-cycle, water-cooled type which follows automobile practice quite closely, employing only features that have been thoroughly tried out and found to be absolutely reliable. Anyone who has had automobile experience can make all incidental repairs or adjustments that may be necessary on the engine, so that the outfit is one that the dealer can handle without finding it necessary to establish a service department.

The engine has considerable surplus power over that required for driving the generator and a pulley has been provided so that the outfit can be used for power purposes as well as lighting. The engine is started by pressing a small lever and the same lever is used to shut down the outfit when the batteries are charged. At a slight additional cost the outfit may be equipped with a device for automatically shutting down the engine

Mayhew Farm Lighting Plant. Type K.

when the batteries are fully charged. This is a feature which has served as an effective talking point on direct connected sets, but in practice has been found to be unimportant. It is for this reason that the makers of this plant furnish this as an extra and by doing so are able to furnish the outfit at a correspondingly lower price.

The switchboard is provided with a voltmeter and ammeter and also a rheostat for controlling the rate at which the batteries are charged. It is a well-known fact that in lighting plant service storage batteries can be made to last for from six to eight years by properly taking care of them, particularly in the matter of avoiding charging the batteries at too high a rate. In the Mayhew plant provision has been made to permit of giving the batteries the kind of attention that makes for long life and satisfactory service.

The generator has a capacity of 800 watts and batteries of various sizes are furnished to meet any condition encountered in farm home lighting. The engine and generator unit are the same in all cases.

The plant takes up very little room and requires a minimum amount of attention, and the operating cost is low. It appears to be a plant that meets the present demand in a most satisfactory manner.

Complete information and prices can be secured by writing direct to the manufacturer.

Two-Stage Air Compressor.

The United States Air Compressor Co. of Cleveland, Ohio, manufacture a complete line of air compressors in both two-stage and single stage types comprising twenty different units. These units vary in capacity from 1½ cubic ft. to 21 cubic ft. per minute and are designed to maintain pressures as high as

500 lbs. The manufacturers call attention particularly to the extreme efficiency obtained by utilizing the two-stage principle.

Every automobile driver realizes that a compound pump, so-called, gives more efficiency than the single type and it is

Two Stage Air Compressor Outfit.

upon the compound principle that the United States Two-Stage Air Compressor is designed. The manufacturers claim that there is less liability for leakage in this type of pump since the first cylinder pumps the air against a low resistance unit, into the second cylinder where it is brought up to the pressure in the tank. In other words, the difference between the atmospheric pressure and that in the tank is divided between the two units. Another advantage gained by this device is that less power is required to drive the small pump than would be required to drive a single switch machine.

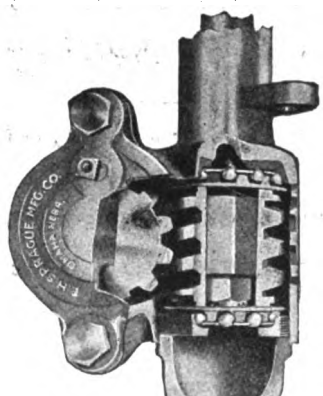
Arrow Grip Chains.

Arrow Grip chains are individual units requiring (generally) six for each rear wheel. The chain used is regular machine or electrical weld of standard pattern.

Chains are held in position by the Arrow Grip device, a patented fixture (see cut) attached to spokes of wheel (see cuts.) This device consists of two upright, hook-shaped fingers, over which link of chain is placed. A snap latch prevents chain jumping lugs and becoming loose.

The clamp is so constructed that all strain and pull devolves upon the felloe and not upon the spoke. Arrow Grips are made in standard sizes, fitting any size or shape spoke. An entire set of chains can be attached or detached in a few minutes.

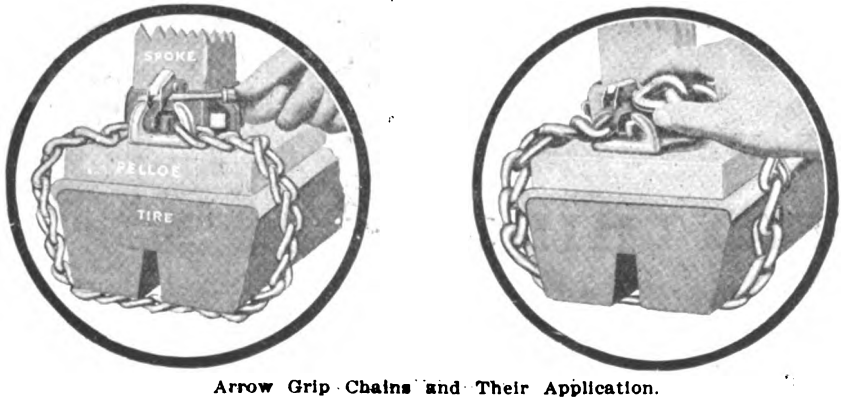
No special links or hooks required. If chain is lost any chain with link large enough to fit over lug can be utilized until replaced. Chains are cut to fit special width wheels.



Prices cannot be quoted because they vary for different size wheels.

The Arrow Grips are now being Parkerized. This, you understand, is an absolutely rust-proof process which leaves the Grip with a beautiful black finish. This system is the same as that being used by the various U. S. Arsenals for rustproofing guns, sea mines, etc., which we believe is quite an improvement.

Arrow Grip chains are manufactured by the Arrow Grip Manufacturing Co., Dept. I, Glens Falls, N. Y., to whom all inquiries should be addressed.



Sprague Worm Steering Gear For Fords.

Every Ford dealer or repair man should read the new advertisement which appears in this issue from the E. H. Sprague Manufacturing Co., Department 14, Omaha, Nebraska. Every Ford user realizes that his car needs stronger steering equipment, something to get him out of the ruts, prevent cramping and upsetting, and to hold the car to the road, relieve the strain on the arms, etc. The Sprague Worm Steering Gear answers this purpose admirably. It is made

Sprague Worm Steering Gear.

with ball bearings and floating shaft metal. The material used is high point steel with a housing of malleable iron. This is a better work steering gear than is used on many higher priced cars. It is a great seller for dealers and it is readily bought by Ford owners in every community.

Arrow Grip Chains and Their Application.

The D. & B. Carburetor.

The carburetor which is illustrated herewith was especially designed, developed and perfected for the Ford motor and is intended for exclusive use on the Ford car. This carburetor is springless, simple and efficient. The gasoline vapor with this device is measured and mixed with mechanical accuracy and

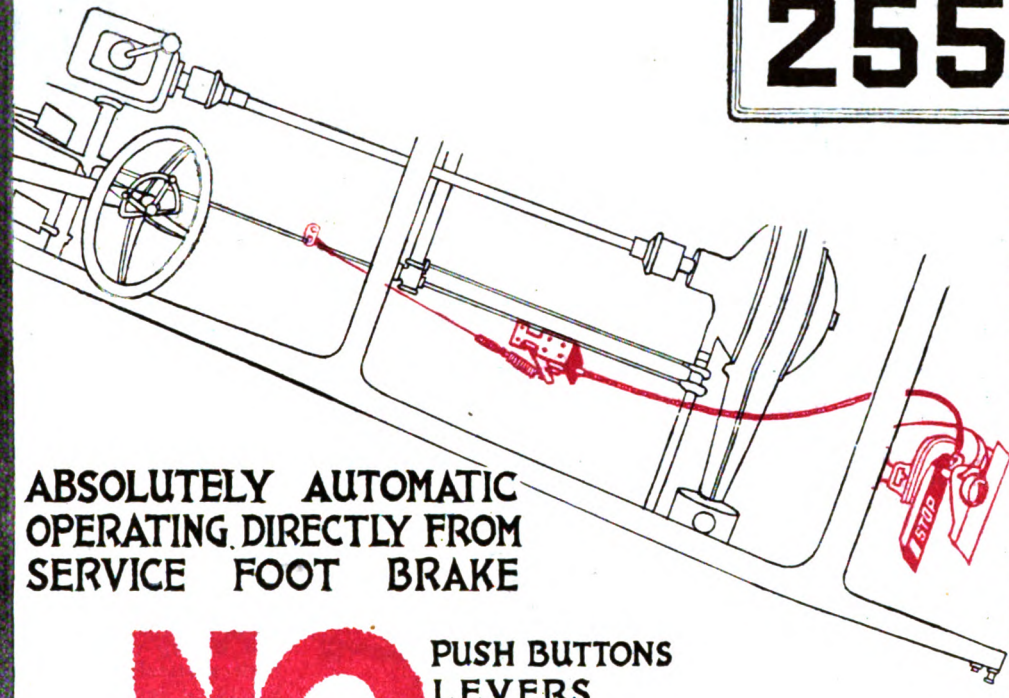
D & B Carburetor.

nothing left to springs or other unstable construction. By the use of this carburetor it is claimed, the Ford owner may be sure of a smooth running powerful motor with maximum mileage and absolute freedom from carburetor troubles of any kind. To install this carburetor no change in controls or manifolds is necessary and it can easily be put on the car by anyone. This carburetor is carried by most live dealers, but if your dealer does not carry it in stock, write direct to the manufacturer, O. C. Harrington Company, 341-345 North Crawford Avenue, Chicago, Ill. Dealers should also write for terms and prices as this carburetor is likely to be a big seller.

Conservation.

There is probably no business today which presents so many opportunities for waste as that of automobile repair and garages. Every garage owner and repair man should do his part in conserving fuel and material for war purposes. Then again he should run his garage with the least possible man labor and keep the latter at its greatest efficiency.

How to do all of these things is told in a free booklet issued by the National Association of Automobile Accessory jobbers, 1920 City Hall Square Bldg., Chicago, Ill., and we would suggest that everyone of our readers interested in garage work should write for this booklet since it contains many pointers relative to the running of a garage.



A New Auto Curtain Light.

The American Auto Window Company, 757 North Broadway, Los Angeles, California, has brought out a new auto curtain light, No. 61, which has great merit. This light consists of a perfectly and absolutely rust-proof frame using only oval head nickle-plated screws. Any and all causes for the cloth to buckle or wrinkle have been eliminated with this curtain light and at the same time the material is firmly held in place so that the cloth cannot possibly pull out. Readers who are interested should write direct to this Company for their new catalog which describes and illustrates the full line of curtain lights made by this well-known concern.

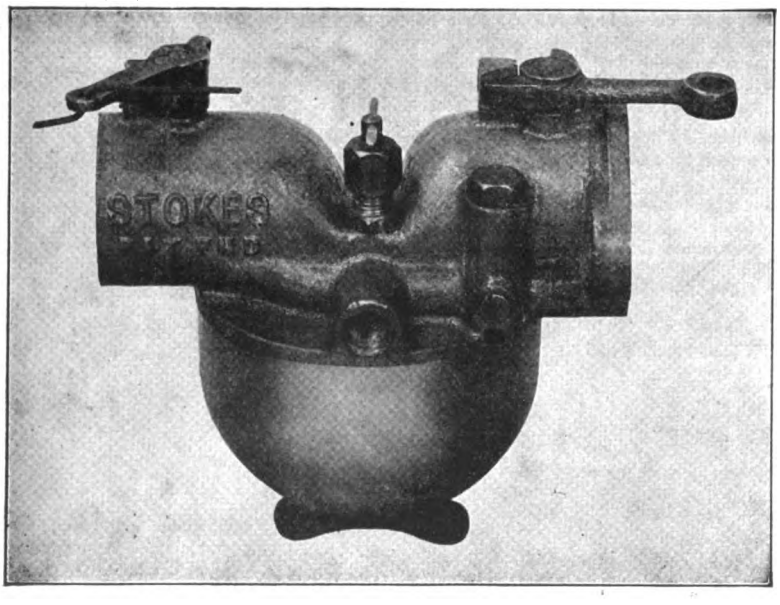
Lock Roll Hose Clamps.

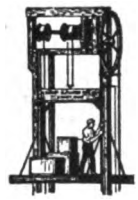
Good hose clamps are very important in any repair shop or garage. The Lock Roll Hose Clamps manufactured by the Federal Tin Company, Inc., and here



Lock Roll Hose Clamp.

illustrated, are scientifically constructed of steel and they cost no more than other makes. These hose clamps are strong, light and efficient, and they are also simple to use, as a screwdriver does the work. These clamps are nickle-plated or parkerized rust proof, and they come in stock sizes from ⅜-in. to 3½-in. by ⅛-in. variations. The dimensions given are the outside diameter of the hose. Send for samples, price list, and discount direct to the Federal Tin Company, Charles and Barre Streets, Baltimore, Md. The Lock Roll Clamps were formerly made by the Han-D Metal Products Corporation of Jersey City. This company has been taken over in its entirety by the Federal Tin Company, and this company with its larger organization facilities and selling organization conveniences are to put this clamp before the users in an extensive advertising campaign.

The Stokes Carburetor.



The trade is manifesting great interest in a new carburetor which has been placed upon the market by the Stokes Carburetor Co. of New York. Some of the points in favor of this carburetor are as follows: It starts and runs with a set spark; it throttles down to two to three miles per hour in high gear without stalling the engine, making it safe to drive through heavy traffic without racing and heating up your motor. It starts in zero weather with two or three turns of the crank. It takes hills easily on high that are impossible with standard equipment. It is claimed that carbon is eliminated by giving perfect combustion which is the simplest method of all. Forty-five miles an hour is easy for a Stokes. The construction of this carburetor is extremely simple, there being no moving parts to give trouble from wear or coagulation. The float chamber can be cleaned in two minutes, by releasing the Thumb-Nut. The installation can be made in 15 minutes by any owner, chauffeur or garage man. A 15-day trial is offered to reliable and interested persons and an unconditional guarantee for one year is given with each carburetor. All who are interested should write for prices and full particulars to the Stokes Carburetor Company, 711-717 East 104th Street, New York City. Dealers should write for the special agency proposition as good territory is now open and Ford agents and repair men are especially urged to write to this company.

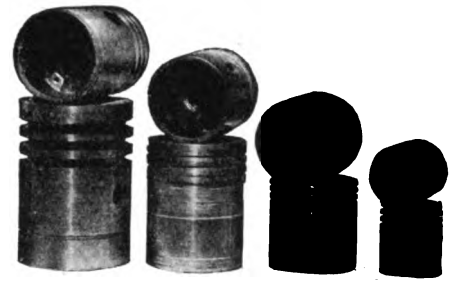
A Good Garage Elevator.

In many garages especially in the larger cities elevators are needed because it is necessary to store cars on more than one floor of the building occupied: An excellent line of elevators, especially adopted for garages, is made



Garage Elevator.

by the Sidney Elevator Manufacturing Co., corner Miami and Shelby Streets, Sidney, Ohio. Write for catalog and prices.

Reboring Cylinders.

We want to call the attention of our readers to the fact that a rebored cylinder has as much service value as a new one in many ways. If a cylinder has been scored or damaged in any way its value may be restored by reboring and for this purpose the Storm Mfg. Co., Box a-26, Thompson, Iowa, manufacture reboring machines of varied capac-

Storm Light Weight Oversize Pistons.

ities from 2⅝ inches as well as a special Ford reborer machine.

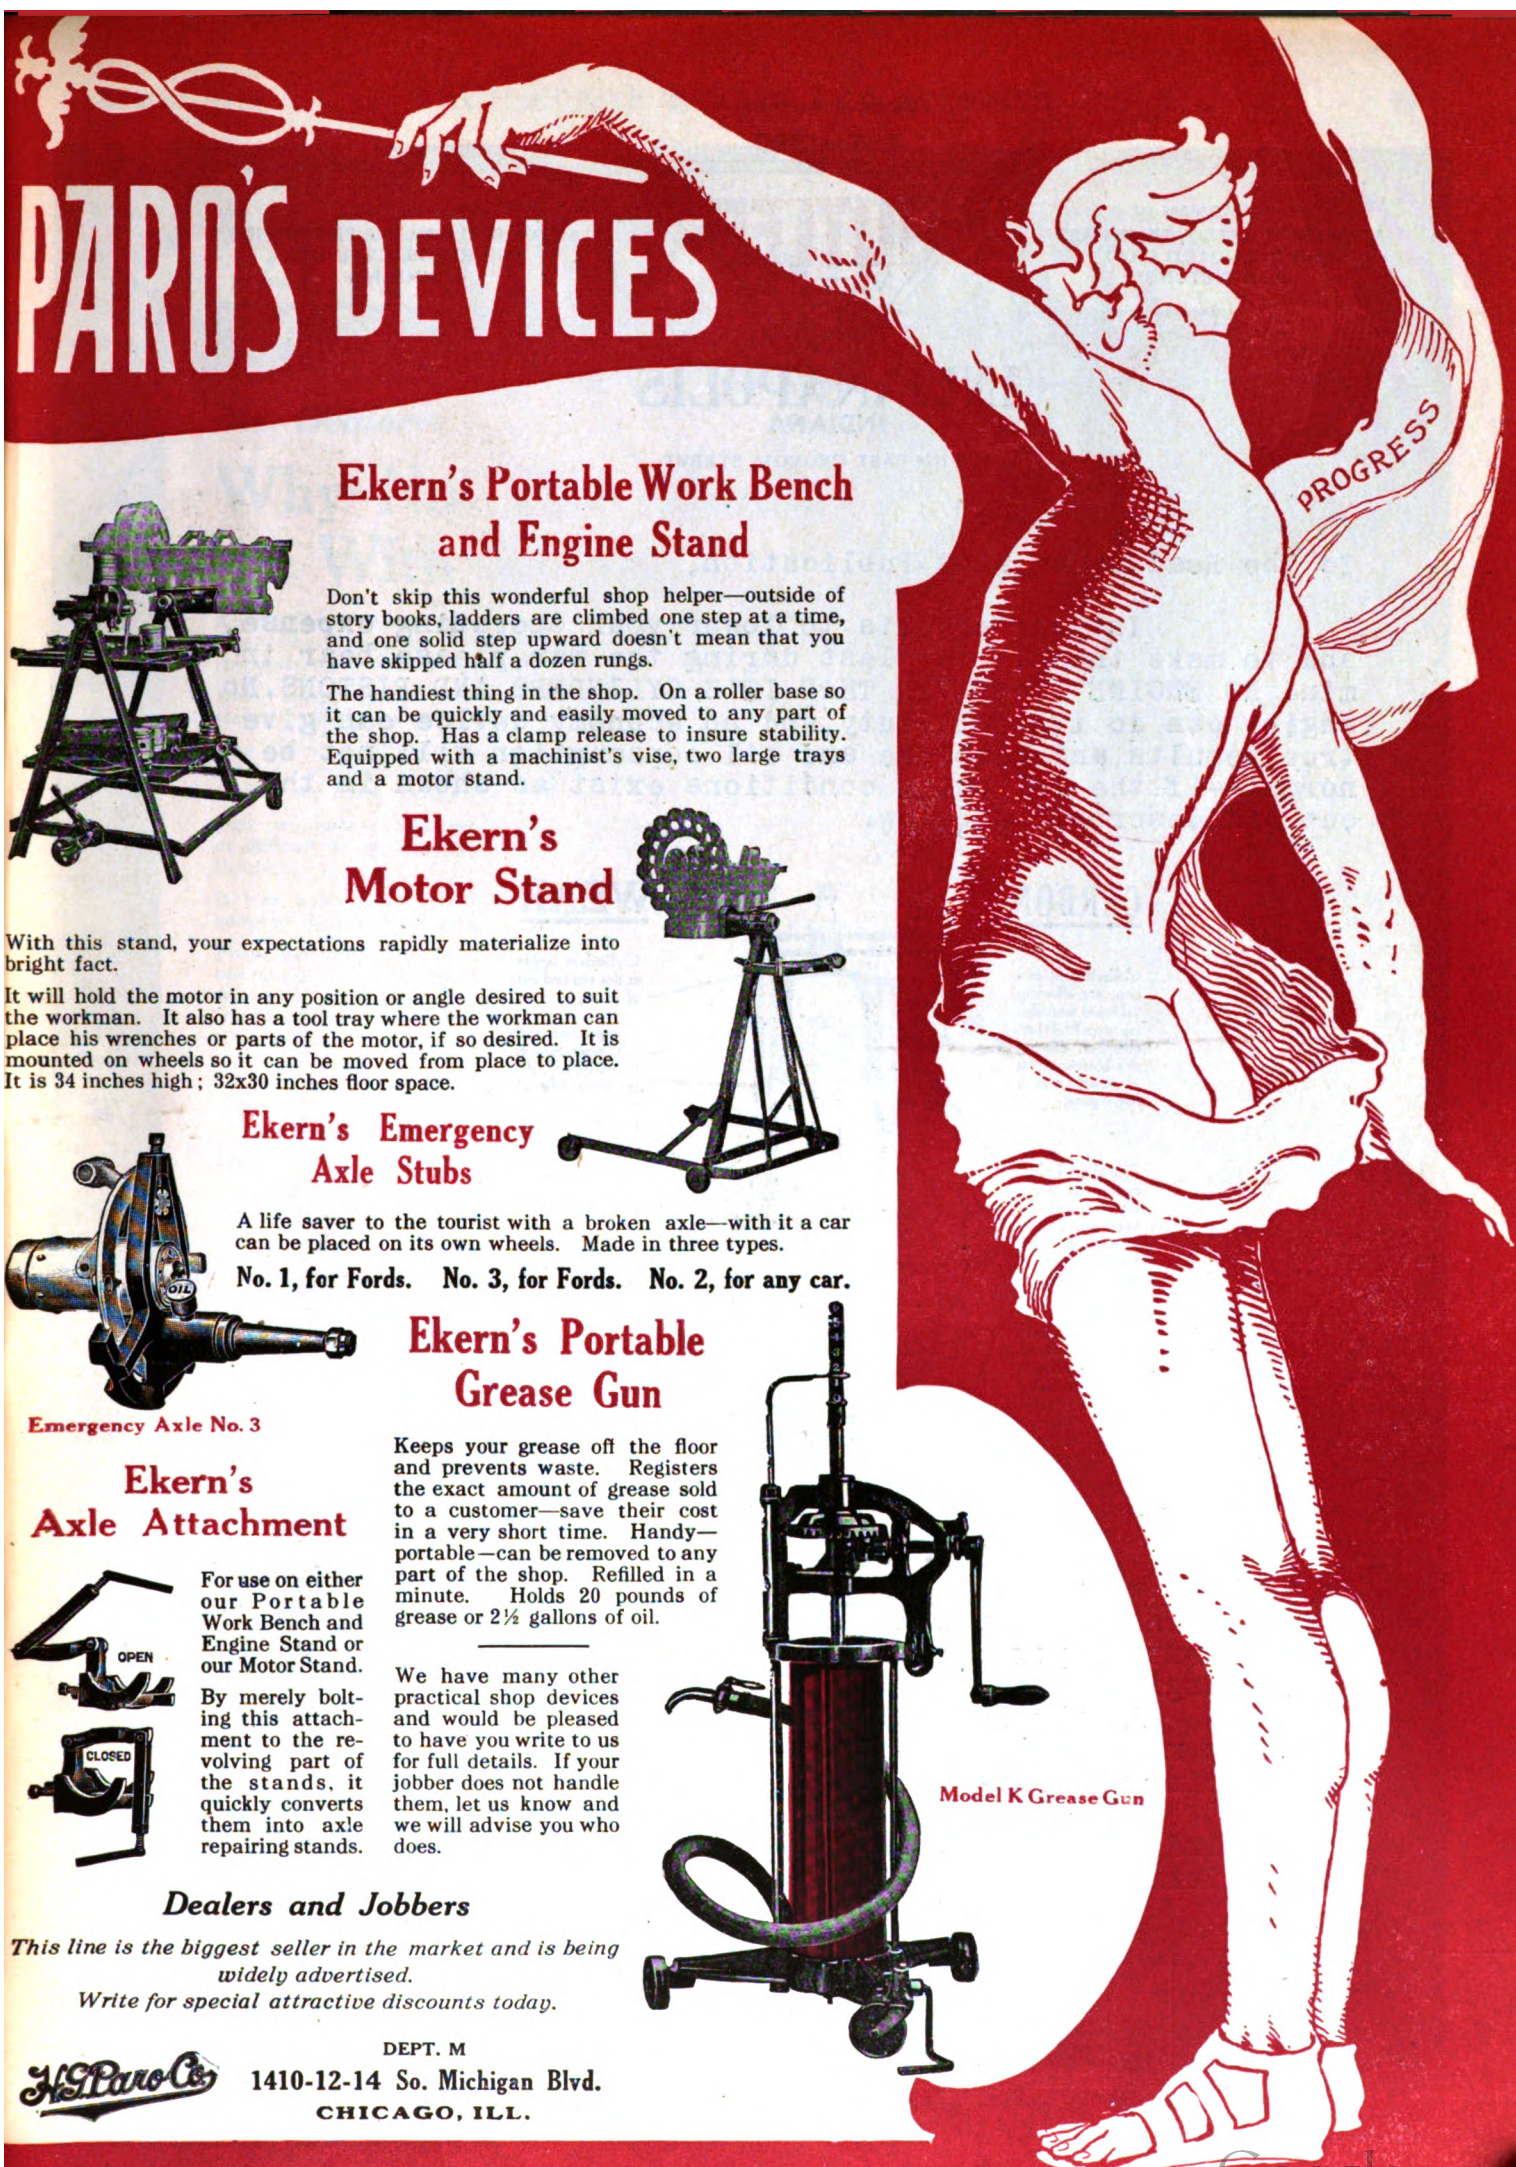
This company is ready to furnish the trade with special oversize pistons for all makes of engines and our readers who are contemplating the reboring of their engines should write this company for full particulars.

Keep Cars In Condition.

Never before has the automobile builder had such an opportunity to demonstrate the life of his particular make truck or passenger car. Never before has the public been compelled to use their automobiles in such great effort.

Automobile reputations are made or lost during this period. The future of each particular make depends upon the length of service, and the ability of the manufacturers and dealers to keep the cars running now in use. If the cars sold can be kept in service no better reputation can be had, and no brighter prospects for future business will be desired.

Thousands of dollars worth of old parts have been junked every year which could often be repaired. Whole cylinder castings have been thrown away, when they could have been reground and new oversize pistons fitted, making a far better engine than when new.



This war will help educate the people to save time, money and material, a lesson which will be instilled into every one and help make the American people stronger in the world.

Toliver Tubes and Tires.

The Toliver Tube and Tire Co., 847 Toliver Bldg., Denver, Colorado, offers a good money-making opportunity to dealers throughout the country. At present there are nearly 3,000 men in this country who are handling the Toliver tubes, tires, and accessories at a good profit. This company has a system of co-operation and sales assistance for their hundreds of representatives which they say practically guarantees success. No capital is necessary. This is an opportunity which many of our readers would do well to follow up by writing to this company for their tube and tire catalog and their special proposition to agents.

PARO'S DEVICES

Ekern's Portable Work Bench and Engine Stand

Don't skip this wonderful shop helper—outside of story books, ladders are climbed one step at a time, and one solid step upward doesn't mean that you have skipped half a dozen rungs.

The handiest thing in the shop. On a roller base so it can be quickly and easily moved to any part of the shop. Has a clamp release to insure stability. Equipped with a machinist's vise, two large trays and a motor stand.

Ekern's Motor Stand

With this stand, your expectations rapidly materialize into bright fact.

It will hold the motor in any position or angle desired to suit the workman. It also has a tool tray where the workman can place his wrenches or parts of the motor, if so desired. It is mounted on wheels so it can be moved from place to place. It is 34 inches high; 32x30 inches floor space.

Ekern's Emergency Axle Stubs

Emergency Axle No. 3

A life saver to the tourist with a broken axle—with it a car can be placed on its own wheels. Made in three types.

No. 1, for Fords. No. 3, for Fords. No. 2, for any car.

Ekern's Axle Attachment

For use on either our Portable Work Bench and Engine Stand or our Motor Stand.

By merely bolting this attachment to the revolving part of the stands, it quickly converts them into axle repairing stands.

Ekern's Portable Grease Gun

Model K Grease Gun

Keeps your grease off the floor and prevents waste. Registers the exact amount of grease sold to a customer—save their cost in a very short time. Handy—portable—can be removed to any part of the shop. Refilled in a minute. Holds 20 pounds of grease or 2½ gallons of oil.

We have many other practical shop devices and would be pleased to have you write to us for full details. If your jobber does not handle them, let us know and we will advise you who does.

Dealers and Jobbers

This line is the biggest seller in the market and is being widely advertised.
Write for special attractive discounts today.

MANUFACTURERS OF
ALUMINUM ALLOY, SEMI CAST
AND STANDARD CAST
IRON PISTONS

AUTOMOBILE PARTS, PISTON PINS
AND RINGS, CYLINDER
GRINDING

To The Readers of This Publication,

In your efforts to lower your operating expense, and to make the old car last during the war, please bear in mind NO ENGINE IS BETTER THAN IT'S CYLINDERS AND PISTONS. No engine can do it's full duty, and no economy device can give true results, and gasolene and oil consmuption will not be normal--if the following conditions exist as shown in the cut and description below.

THE CURE

is to have us regrind the cylinders and fit new pistons, rings, and pins. This will permit economy of operation and allow full development of power, besides lengthening the life and usefulness of the engine.

As the largest concern in the middle west, we have features no one else has, and can give service, workmanship and engineering which is extremely hard to surpass.

If your engine has the ailments as shown above, ship the cylinders, pistons, pins and rods to-day. Should you desire more information write us.

Yours for better engines,

BUTLER MANUFACTURING CO.,

Per. Chas. R. Butler

QUICK-UNFAILING RECOIL

WITH ALL THE KICK LEFT OUT

HIGGINS

QUALITY SPRINGS

FOR REPLACEMENT

"Win the War First"—everything else is of secondary importance now—the life of the Nation is at stake. If it is *lost—everything* is lost.

Save! Conserve! *And Serve.* Do your bit—*and some.* That's our spirit—War First—*Win First.* And that's the spirit you'll find in Higgins Quality Springs. A clean fight to the finish—quality that doesn't know the meaning of defeat—that absolutely *refuses* to surrender to the most brutal attacks of bumpy travel.

The sort of spring service you need to protect your car—to conserve costs—and to render most efficient service in a military, purely patriotic or industrial way.

With us—it is Government demands above everything else—consequently, we make no unpatriotic or untruthful delivery promises. We are serving the Nation to the full extent of our ability. We will serve *you* as quickly as conditions will permit. And—this you may be sure of—the Springs you do get will rank up to your demands—no center bolt—no center breakage—or breakage in any section.

IF YOUR DEALER REFUSES TO SUPPLY YOU, WRITE US.

DEALERS—who are particularly interested in after-the-war trade development—write for catalog listing 500 different styles of springs and Selling Helps.

Petry Universal Pedal.

The N. A. Petry Company of Philadelphia, Pa., are putting on the market an interesting product known as the Petry Universal Pedal which may be used for any one of a number of different things. It is fitted with an adjustable lever which may be placed in any number of different positions as shown on the accompanying illustration. This

Petry Universal Pedal.

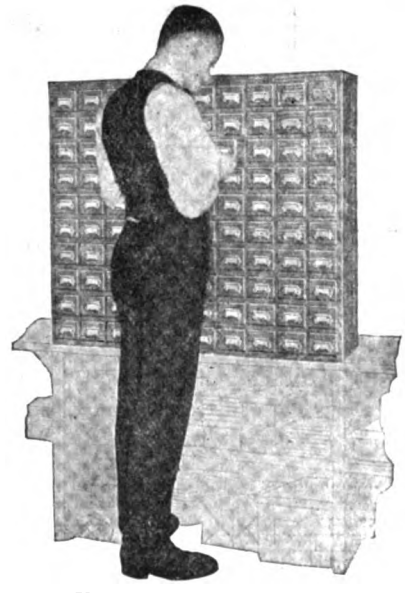
device permits one to place it either upon the floor board or upon the toe board and so operate a whistle, a horn, accelerator, or cut-out either by pressure or by pulling upon the knob, according to the installation. The device should be of great interest to anyone desiring to install a special accessory on their car and we would advise our subscribers to send for a catalog.

Service Satisfaction for Trucks.

Auto trucks have been a wonderful factor in the present great war. In fact it will probably go on record after the war is over that it has been won chiefly by means of aeroplanes and trucks. One of the most important parts in the construction of a truck is found in the bearings as the trucks roll along on these bearings under tremendous loads. The Ahlberg Bearing Co., 2636 Michigan Avenue, Chicago, Ill., makes a specialty of regrinding, and reassembling all kinds of ball bearings and they state that in quality and workmanship these bearings, reground by the scientific method, are actually better than new bearings in many cases. It is not necessary to lay your truck up for the want of a bearing, but instead get in touch with the Ahlberg Bearing Company or one of its service branches and the bearing can be quickly put into condition again. This large company has service branches in the following cities: New York, Boston, Cleveland, St. Louis, Philadelphia, Minneapolis, Detroit, Portland, Oregon, Los Angeles, San Francisco, Atlanta.

An Agency Opportunity.

Many readers could make a considerable addition to their incomes by acting as agencies for the quick power and lighting outfits for farm houses which are manufactured by the Western Electric Co. More than forty years of electrical manufacturing experience is back of all these Western Electric Power and Light outfits. If the reader of this article chooses to be the man in his particular community to represent these outfits he will make no mistake about it. The Western Electric Co. backs up its agencies by means of extensive advertising in such well-known organs as the Country Gentleman and other leading farm papers. Readers who are interested should fill out the coupon which appears in the full page advertisement of this Company in the present issue of our magazine and send it in direct to the main office of the Western Electric Co., 195 Broadway, New York City.



Eccolene Carbon Reducer.

Undoubtedly carbon is the greatest bugaboo of the autoist and seemingly the average driver does not know how to prevent the formation of this product. The Edward A. Cassidy Co. Inc., 280 Madison Ave., New York City, are marketing a product termed Eccolene which they guarantee to give satisfaction or money will be refunded.

This product is said to cause an increase in economy of at least 20%. Eccolene is sold by the gallon and designed to be mixed with gasoline. They claim that when this product is used, carbon does not form in the cylinders and that increased efficiency results.

Universal Screw Cabinet.

The Universal Screw Cabinet is a convenient, serviceable and economical cabinet designed for screws, brads, nails, nuts, bolts, automobile accessories and other small articles. It keeps shelves clean and prevents duplication of stock. It will save its small cost many times in a year in providing a place where every screw or part may be put and where everything can be found instantly when needed. It is substantially built of oak and steel. The back panel is of

Universal Screw Cabinet.

sheet steel, making the cabinet proof against dust and vermin. The sides and bottom of each drawer are made from one piece of sheet steel. The back and front of each drawer are wood, making an extremely light and strong drawer that will not stick or bind. The finish is light golden oak, polished brass drawer pulls and card holders. Drawers are 8x3x2½ inches, inside measures.

The Universal Screw Cabinet is made by the Hobart Brothers Company, Troy, Ohio, being furnished in two sizes, 50 drawers and 100 drawers (as illustrated) at reasonable prices.

Cylinders Reground

ATTENTION
Those Requiring the Very Best in
CYLINDER GRINDING

fitting with light grey iron pistons, leakless rings, hardened and ground pins, our work has no comparison with the ordinary, now obsolete heavy type pistons and rough boring jobs. We grind our cylinders to one-half thousandths, mirror finish. We grind our pistons on the highest grade machines to fit, two and one-half thousandths clearance. We use the McCadden leakless piston rings. Work all reassembled ready for installation. All work positively guaranteed.

Patterns and castings in stock for every make of motor.

Rectifiers

RECTIFIERS to charge from A-C circuit 1 to 8 ignition lighting or starting batteries at one time, $12.00 upward. American Battery Co., 1136 Fulton St., Chicago, Ill.

Ignition Wires and Cables.

In these days of stress to procure deliveries of merchandise, it is of particular interest and benefit to jobbers that J. H. Faw, Inc., at 37 Warren Street, New York City, have increased their stock of Ignition Wires and Lighting Cables to take care of this demand.

They carry about forty numbers of wires, aggregating five million feet and have been making prompt shipments on practically all numbers. One of their specialties, the "Fawsco Ignition Assembly" or Ford Harness has proven its continued worth by increased popularity.

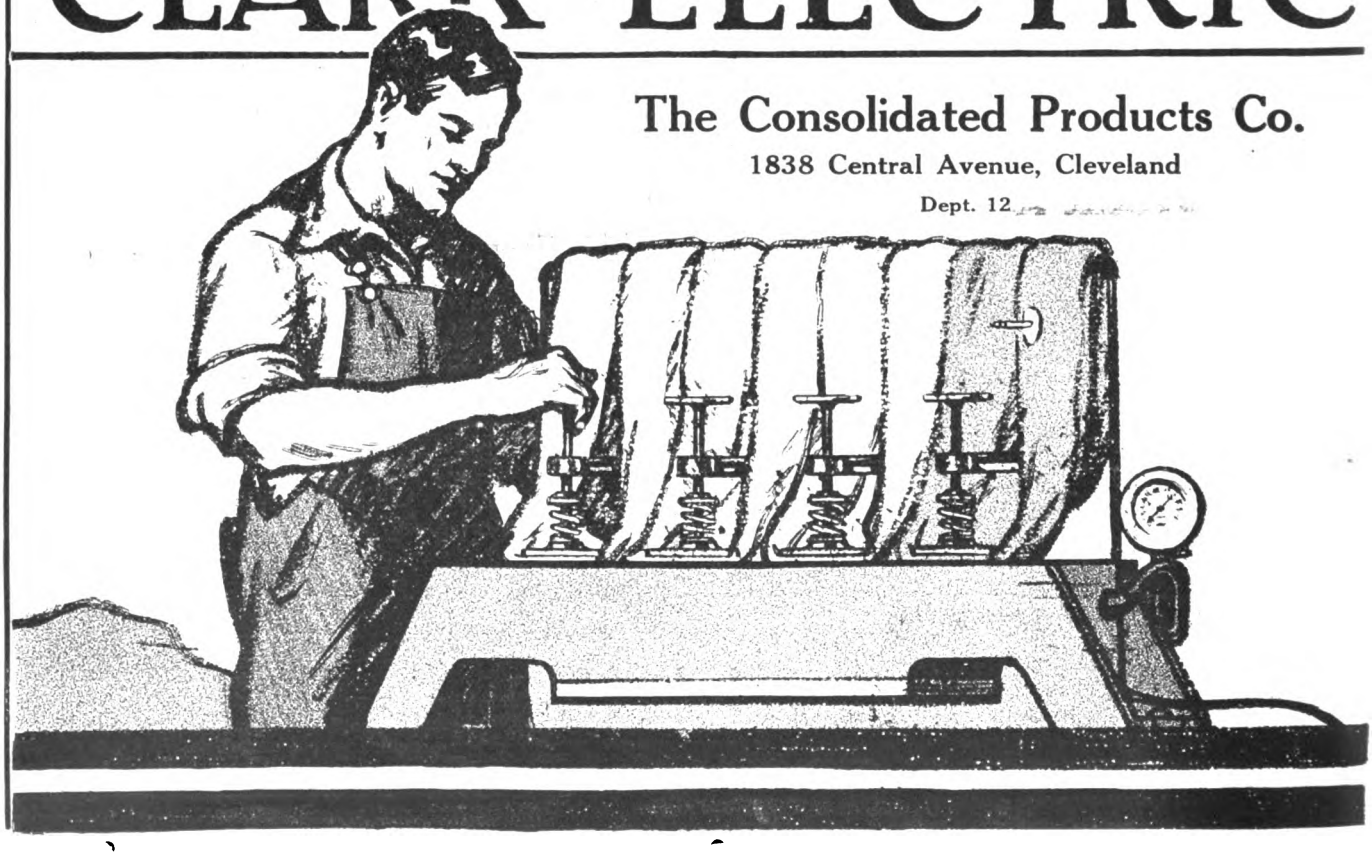
Put This Electric-Steam Vulcanizer in Your Garage and Earn $15 for Each $1 Invested

Here's the only steam vulcanizer that fire laws permit anywhere. No open flame, no boiler, no fire risk or danger of explosion. And absolutely automatic. A boy can run it. Steam pressure absolutely maintained within one pound variation. Hitch it to any electric light socket. Endorsed by 17 leading rubber companies.



You know that the high prices of tires, the elimination of many sizes, the reduced output of tires and tubes, are doubling, yes, trebling, the tire and tube repair business all over the country.

Never before was there such an opportunity for the garageman, for the accessory dealer and jobber, even the gasoline and oil stations.

Perhaps you have been taking in tube and tire repairs but sending them to somebody else to be vulcanized. You don't have to do that any longer. Perhaps your local fire laws would not permit vulcanizing on the premises. Perhaps you didn't have enough work to justify firing up one of the old style outfits, with its big fuel bill.

But you can install a Clark Automatic Electric-Steam Vulcanizer anywhere. It makes 60 pounds of steam in 25 minutes. In five hours' use, it burns only one hour's current. ***It costs less to buy and to run that any other vulcanizer of equal capacity.***

CLARK ELECTRIC

The Consolidated Products Co.

1838 Central Avenue, Cleveland

Dept. 12

Digitized by Google

Pressure Absolutely Controlled Within One Pound—Impossible to Over-Cure

It's a steam vulcanizer—that's why the ***big rubber companies all endorse it.*** Ask any of them. It's automatic—after reaching the required pressure, the current is opened and shut intermittently whenever the pressure falls or rises **one** pound!

You positively cannot over-cure a tube or tire on the Clark Automatic Electric-Steam Vulcanizer. The steam pressure and temperature you set it for is absolutely maintained. You can go away and leave it—no danger.

With the Clark Automatic Electric-Steam Vulcanizer you can get a machine just right in size for your business. You can run it one, two or ten hours a day—and every job will be perfect.

Vulcanizing business costs nothing to get—it pays big. The Clark makes this possible in any and every garage or accessory store. You can handle anything from a pin hole to a rip 20 in. long.

$22.14 profit for 3 hours' work

50 tubes repaired, average 50c each - - - - $25.00

Cost of repair material about 2c each -	$1.00
Electricity 3 hrs. at 2c an hour - -	.06
3 hrs. labor at 60c an hour - - -	1.80
	$2.86
Profit - -	$22.14

JOBBERS—Here's an accessory that will sell. There are models for Public Garages, Business Garages, Express Co's, Municipal Garages, Harness Shops, Accessory Stores and Regular Repair Shops. Demonstrating working models can be carried by salesmen. Write today for literature and full details.

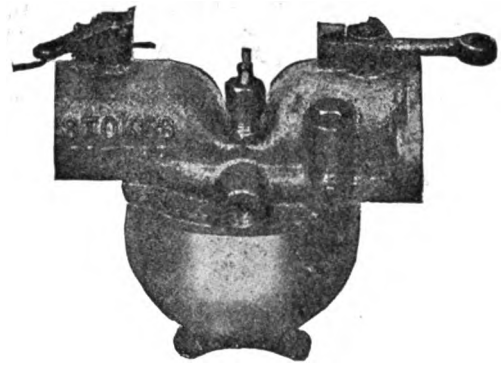
"I'll tell you what the STOKES CARBURETOR is doing for me, Joe!"

"To start with, I found that the first customer brought in two more, and every customer becomes enthusiastic and unconsciously an effective salesman. And best of all, Joe, they don't return them, they keep them.

"You ought to hear the enthusiastic remarks they make!—such as, 'It makes my Ford run like a steamer—so smooth, quiet and responsive!' 'It's a real delight to start my car in Winter as well as in Summer!'



"Believe me, I like that 'quick get away' and that wonderful 'STOKES PEP' it gives the motor! And POWER! Say, jump in and let me show you how she takes that big pet hill that I could never make on high before.

"And did you notice the simple adjustment? You can't go wrong on it. 'It makes my Ford run as smooth and flexible as an eight-cylinder car!' 'It's the biggest surprise I ever had—it makes her climb hills so easily that it's simply wonderful!'

"That's what they say, Joe, and it's all true—every word of it. At first, I only handled it as a dealer. But seeing it was such a good thing I took the jobber's proposition for my county. I have a man out on the road now establishing dealers throughout the county and it is making friends for us everywhere.

"It is increasing their mileage per gallon of gas on the average fully 35%. That's saving quite some money for them, and Gas for our country and our Allies. And for me, it's the easiest way of making money that I know of.

"As a good friend, Joe, take it from me, don't you lose a single minute just thinking about the proposition—if you do, somebody else 'll get ahead of you;—they are all learning about it being such a good seller—jump to it and you'll find yourself just as enthusiastic as I am."

AUTO REPAIR MEN AND GARAGE OWNERS

It is because we realize that you are in the better position to appreciate the Superiority of the STOKES CARBURETOR, that we establish our dealers and jobbers with you.

The carburetor not only sells itself, giving you liberal commission, but it makes friends for you whose other repair work you get.

It so markedly surpasses all other makes on the 5 vital points:—EASY STARTING; FLEXIBILITY; POWER; SIMPLICITY; ECONOMY—that it is becoming known everywhere, as "*The Leading Carburetor.*"

Put on for a 15 days' trial, it never fails to add a new booster to its rapidly growing list.

The price is $15.00. We furnish a written guarantee. If a purchaser is not entirely satisfied after 15 days' trial that it is the best carburetor in the world to date, the purchase price will be refunded.

Write for full particulars today. Mail coupon herewith attached and we will give the order our prompt attention.

The Stokes Carburetor Co., Inc.

781-3 East 142nd Street :-: New York City

KINDLY ATTACH THIS COUPON TO YOUR LETTERHEAD

STOKES CARBURETOR CO., Inc.

COUPON

Please send me one carburetor C. O. D., with full directions, for trial. Price, $15.00—less dealers' discount. It is understood that if within 15 days I find it not satisfactory and as represented that I can return it and you will refund my money.

Short of Help? This Hoist Does the Work of an Extra Man

Keep Your Workmen Satisfied—Let a WEAVER HOIST Do the Heavy Work

WEAVER Auto Hoist

ONE MAN WITH THIS HOIST CAN DO ALL KINDS of WORK AROUND A CAR

He can pick up the front or back of a car in 2 minutes' time, making accessible the car's under mechanism. Unaided he can take out a motor or remove a body—in a fraction of the time it would take 2 men to do the same work by hand. He can roll the crane to a car quicker than 3 men can shove a car to the crane. In short, every garage—and repairman—can save many times over in time and wages the initial cost of a Weaver Auto Hoist.

SAFETY

This lifting mechanism is operated by WORM DRIVE;—no treacherous ratchets to slip or break. The chains are heavy and are each tested INDIVIDUALLY far in excess of their required strength.

The bases are made very broad in order to prevent the Hoist turning over under any circumstances.

TELESCOPING FRAME

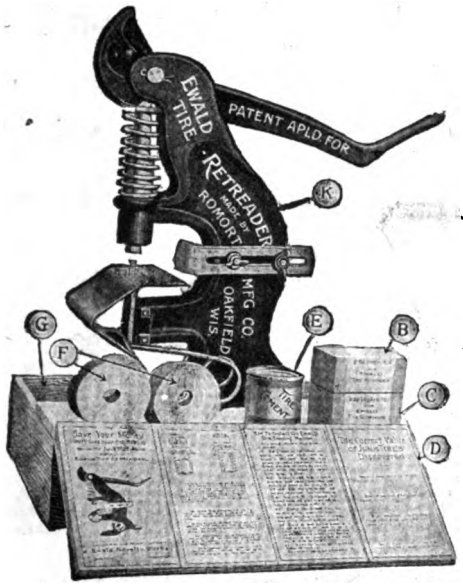
The height of the frame may be increased one foot by means of its own lifting mechanism. This is often a great convenience in raising the rear of a closed car.

SINGLE OR DOUBLE CHAIN

When so desired, the burden can be handled by a single suspension, as shown in the small cut in the lower right hand corner. This is done by simply dropping the chain over the center roller.

CONSTRUCTION

Frame of heavy five inch channel steel; large ball and roller bearing casters; lifting leverage, 500 to 1; capacity, 3,000 lbs.; height, 8 to 9 ft.



Write for catalog of our complete line of Garage Equipment.

EWALD Tire Retreader Outfit

A.—RETREADING MACHINE
B.—250 SPECIAL STAPLES, ½-IN. LONG
C.—250 SPECIAL STAPLES, ⅝-IN. LONG
D.—FULL SHEET OF DIRECTIONS
E.—1 CAN TIRE CEMENT
F.—2 ROLLS RUBBER RELINER
G.—1 SHIPPING BOX

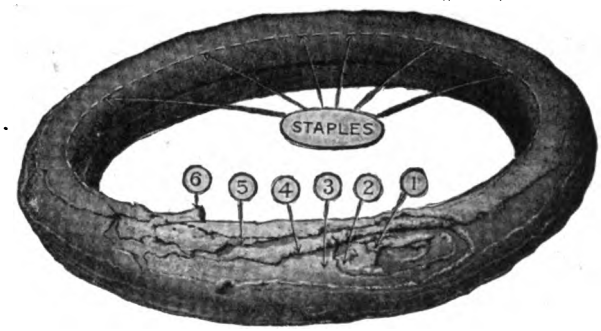
One Repair Man Writes:

"IT PAID FOR ITSELF THE FIRST DAY"

It is easy to staple 10 tires a day with the Ewald Tire Retreader at $2.50 per tire.

How would you like to make $25.00 and over per day or $650.00 per month?

Here is a chance for the Tire Repair Man to coin some money.



Auto drivers will have to have their tires repaired because the Government is taking 70% of all the rubber. It is up to the Repair Man to help save all the tires he can.

Save Your Money

Don't Give Your Old Tires to the Junk Man

INSTALL AN

Ewald Tire Retreader

The above tires were stapled by the Ewald Tire Retreader and then run over two thousand miles. You can see the fabric at 1, 2, 3, 4, 5 and 6 as it wore away, but not a single staple pulled out.

RAJAH

Shipments Are Delayed

Shipments of Rajah Plugs are considerably delayed owing to heavy government requirements placed with the Rajah factory.

In some sections of the country Rajah Plugs are almost unobtainable. *Don't let this happen to you.*

We strongly urge you to place your orders now, anticipating your requirements as far ahead as possible to insure your having stock on hand.

Rajah Terminals and Adapters

are furnished so that Rajah Plugs can be used with any car.

Rajah Regular and Ferrule Clip Terminals

Adjustable to any cable and with ferrule to fit any cable. With the extra collar supplied both can be used with any make of plug.

Rajah Thumb Nut and Stud Terminals

The Thumb nut is an adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six and Pullman. The Stud for Buick, Chevrolet and Oldsmobile.

Rajah Ball Terminal

Adapter for Franklin, Locomobile and Willys-Knight.

Manufactured by

Rajah Auto-Supply Co.
Bloomfield, N. J.

Sales Department
Edward A. Cassidy Co.
280 Madison Ave., New York

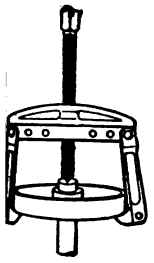
The Super-power plug

Rajah is the spark plug demanded by aviators. It is the choice of automobile racers and hill climbers. It is found in the fastest speed boats.

It gives the same reliable results in pleasure cars or motor trucks—ignites ALL the gas with a lightning-hot spark, adds power and quicker pick-up.

The aviator entrusts his life to Rajah Spark Plugs; the racer counts on them for his success. You can cash in on their ability to give any car a big margin of power and speed.

Rajah Plugs achieved their reputation by delivering exceptional service under severe conditions.



Sell a *complete set* of Rajah Plugs and give your customers the full benefit of the change.

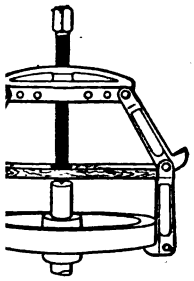
THE CRANE WHEEL AND GEAR PULLER



-Arm Puller removrk near end of shaft.

k beyond reach of t of arms.

e-Arm Puller pulling three points will recollars and work that be started with the m pullers.

-Arm Puller on work e diameter (a piece d being used as a er).

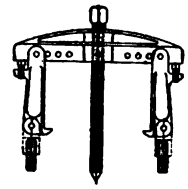
The most practical device for safely removing fly wheels, auto wheels, gears, cams, sprockets, collars, couplings, commutators, propellers, etc.; bending pipe, straightening shaft and removing universal joints.

The screw has a flat end with inserted tempered tool steel point, that will not spread centers. Makes its own center on work that has none. The strain is taken on the flat end of the screw. The screws are made of high carbon steel and case-hardened all over.

No. 0 Puller — Designed for all kinds of small work — including timing gears, magneto and pump shaft gears, etc., that are designed to be removed by stud-bolts screwed in tapped holes in the web. The forked stud-bolts, shown attached to the hook end of the arm with pins, are furnished blank and can be drilled and tapped by the purchaser for the proper thread of his work: and case-hardened headless set screws can be used for the stud. This puller takes light work 5 inches in diameter and 3 inches from the end of shaft. It has the new patent Locking Arm, forked stud-bolts and case-hardened screw.

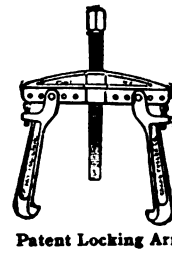
Made with two arms only, weight 2½ lbs, each **$2.50**

Both **No. 2** and **No. 3** Pullers are made in 2 and 3 Arm styles.



Furnished with one set of Combination Hook and Extension Arms and one set of Thin Jaw Arms.

No. 2 Puller — Takes work 9 in. in diameter. One set of arms reaches 5½ in.; two sets arms reach 11 in. This size is particularly adapted for the average garage and repair shop.



Two-Arm style, weight, boxed, 16 lbs., each ..... **$ 8.00**
Three-Arm style, weight, boxed, 19 lbs., each **$10.50**

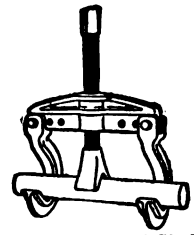
No. 3 Puller — Takes work 13 in. in diameter. One set arms reaches 6 in.; two sets arms reach 13 in. This size will meet the requirements of work of all kinds.

Two-Arm style, weight, boxed, 28 lbs., each **$10.00**
Three-Arm style, weight, boxed, 39 lbs., each **$13.00**

No. 0 Two-Arm Puller

Patent Locking Arm

NEW CRANE PULLER FEATURES



Makes this popular device more practical and valuable than ever.
Every garage and repair-man will appreciate these new attachments.

PATENT LOCKING ARM

A most valuable feature — prevents the arms from slipping off the work.

No 2 Locking Arm — Reaches 9 inches, fits either two or three arm style of the No. 2 Puller. Weight 2½ lbs., each **$1.00**

No. 3 Locking Arm — Reaches 10 inches, fits either two or three arm style of the No. 3 Puller. Weight, 3½ lbs., each **$1.25**

Pipe Bending and Shaft Straightening Attachment

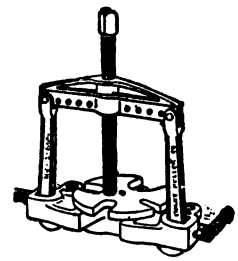
PIPE BENDING AND SHAFT STRAIGHTENING ATTACHMENT

For use with Two-Arm Pullers only: consists of a pair of arms with hooks at right angles to the hooks on the regular arms and a forked end for the screw. It is indispensable in a repair shop for straightening propeller and jack shafts, bending exhaust pipes, removing universal joints, etc.

No. 2, Wt. 6½ lbs., each ..... **$2.75** **No. 3**, Wt. 9½ lbs., each **$3.50**

EXTRA SIZE NO. 3 BEAMS

No. 3 X Two-Arm — Takes work 16 in. in diameter. Weight 13½ lbs., each **$5.56**



No. 3 X Three-Arm — Takes work 28 in. in diameter. Weight, 32 lbs., each **$12.00**

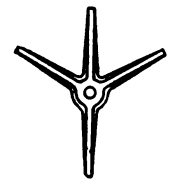
ARBOR PRESS BASE

This attachment bolts to the bench. Your Puller is fastened to it with two set screws, making an excellent and practical arbor press.

No. 2 — 2-Arm Base, takes work 7 inches in diameter, weight 18 lbs., each **$5.50**

No. 3 — 2-Arm Base, takes work 11½ inches in diameter, weight 30 lbs., each **$7.50**

Arbor Press Base



CROWFOOT BEAM

A combination two and three arm beam does the work of both.

No. 2 — Weight 7 lbs., each ..... **$4.00** **No. 3** — Weight 13 lbs., each **$5.94**

PRICE LIST OF EXTRA PARTS

No. 2 PULLER		Each	No. 3 PULLER		Each
2-Arm Beam	Weight 4½ lbs.	$2.56	2-Arm Beam	Weight 7½ lbs.	$3.56

Pins		.06	Pins		.06

Crowfoot Beam

INSTRUCTIONS FOR USING

KEEP SCREW WELL LUBRICATED with graphite grease, especly for heavy work. **Also grease point of screw to prevent cutting, The tendency to twist off work caused by friction of screw in the am under heavy strain with the Two-Arm Puller should be ercome by holding against this strain with a monkey wrench the end of beam.** The Three-Arm Puller is provided with a lever this purpose. A piece of emery cloth or sandpaper put under the oks rough side down will keep them from slipping.

Tie or wire the arms to the work. When removing fly-wheel with spokes and the hooks will not fit down on the hub, turn the arms around with hooks facing outward, place parallel pieces of iron across spokes for the hooks to pull on, and tie or wire them to hold securely in place.

When using the Two-Arm Puller, be sure to have point of screw directly in center line of hooks and not a little to one side. In pulling on irregular work, care should be taken to have each arm pull evenly by placing blocks under arm on short side of work or the screw will be bent.

JARANTEE. **We guarantee the materials and workmanship in these tools and will replace any defective part without question and absolutely free of charge upon return of defective part to us.**

JEWELL BATTERY GAUGE

The Ever Watchful Guardian Of Your Battery.

Tells you exactly what you ought to know exactly when you should know it.

Most of the ills to which a storage battery is subject may by easily cured if prompt action is taker.

A lot of things may happen between twice-a-month hydrometer tests that will result in destruction before the next test is due.

The **Jewell Battery Gauge** gives prompt warning of short circuits, low water, low charging current, excessive draft through starter and in fact practically every trouble that ultimately causes disaster to the battery.

Every car owner who has experienced the unpleasantness of hydrometer tests, or paid big battery repair bills, buys on sight.

Approved by battery manufacturers, service stations and experts.

Live dealers and garage men, get busy. Here is a device that is worth many times the price to the buyer and pays big profits to the dealer.

You can't afford to overlook it. Attached by anyone in half an hour.

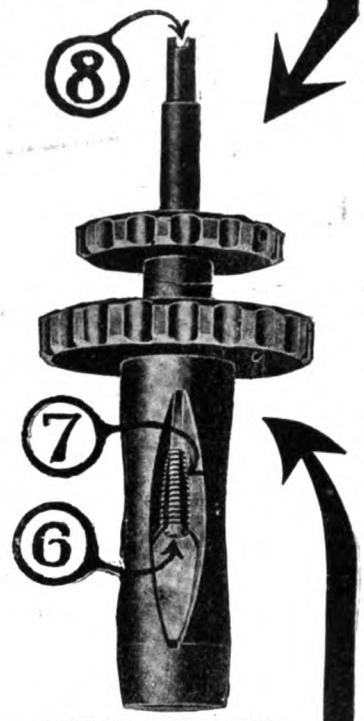
IT'S DANGEROUS

To the Life of Your Tires to Be Without A & H Valve Tools

Tire and Tube Expenses are one of the largest items the owners of automobiles have. **The Tires are the most abused part of the car, due to receiving improper care and attention, insufficient air and neglect in not having air-tight valves.**

VALVE REPAIR TOOLS
(Actual Size)



Tire Manufacturers claim that 75% of adjustments are due to under-inflation. Why continue to abuse your pocketbook, when you can remedy this condition by using A & H Valve Tools, they take care of every condition arising from your valves and prevent the annoying slow leaks.

A SURE SIGN of carbon is a smoky exhaust, due to lubrication getting *past* the piston rings up into the combustion chambers where it *burns*. Leaky piston rings waste as high as 25% gasoline —one drop in four.

HI-COMP PISTON RING

"THE RING THAT MAKES THE MOTOR SING"

are the best gas-tight rings for overcoming engine troubles due to carbon—knocking, skipping, faulty ignition; valve pitting, wearing down of cylinder walls, piston and piston rings; smoky exhausts.

Hi-Comp Piston Rings are made from two perfectly balanced perfect eccentric rings into one absolutely gas-tight concentric ring. Each ring ground under oil — not buffetted — to preserve the true temper of the secret process gray iron and ensure high polish and gas-tight fit. Won't wear cylinders out of round — *proof* of gas-tightness. Make reboring of average cylinders unnecessary — an exclusive Hi-Comp advantage. Hi-Comp Piston Rings deliver every ounce of power from every drop of gasoline on to the piston head — no power or oil can get past them!

It will pay you to install Hi-Comp because of the satisfaction they give to you and your customers. Fully guaranteed by an old established piston ring company to give MORE POWER on less gasoline and oil. Write for booklet, specification chart and details of 90-day trial guarantee

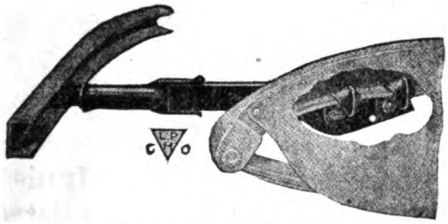
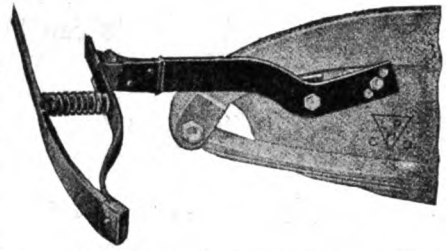
HALLADAY BUMPERS AUTOMOBILE ACCESSORIES



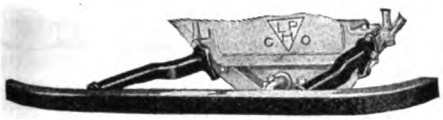
AND



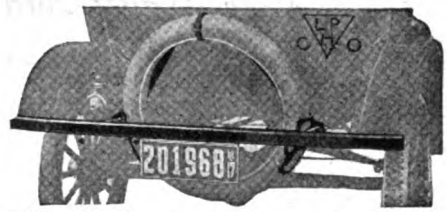
HALLADAY HELPS FOR FORD CARS

HALLADAY

Under Clamp Bumpers

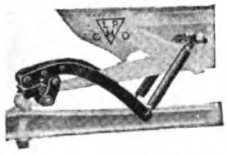


For All Front Extension Frames

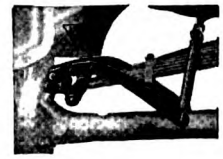


Here is the latest Halladay Bumper, the big business getter of them all as it fits practically every extension frame car built. Like all Halladay equipment it has special features all its own and none of the weak points of others of similar type. We supply it with all the Halladay bars.

There is a HALLADAY Bumper to fit every taste and every car



Bumpers for Fords

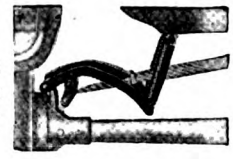


The Halladay front bumper for Ford cars is too well-known to need detailed description. It is built for hard service, is quickly attached and stays put.

The New Halladay Rear Bumper. The strongest and most durable rear bumper ever put on a Ford.

It is supplied with or without the tire carrier, which possesses the usual features of Halladay superiority. The tire is supported by two cradles secured to the bumper arm and is held in vertical position by an arm extending upward from the cradle. There is no attachment to the body anywhere.

FLEXLEVERS



The New Halladay All-Steel Flexlever retains all previous points of supremacy with the additional features of steel spring arms, double springs, and malleable steel bearings, the most durable and efficient bearing ever made to meet the requirements of shock absorber surface. They are supplied in sets of four or in pairs for front or rear.

THIS IS THE ONLY SHOCK ABSORBER OF THIS TYPE FOR FORD CARS THAT CAN BE ATTACHED WITHOUT REMOVAL OF THE REAR WHEELS OR INTERFERENCE WITH THE SPRING PERCHES.

Double Arm Shock Absorbers

The Halladay Double Arm Shock Absorbers now possess all the valuable features of the Flexlevers except that of quick installing and may be applied as quickly and easily as any other shock absorber for Ford cars, except the Flexlever.

We also make the Halladay Tilting Steering Wheel for Fords, Halladay Can Tippers and other Ford Accessories. Live dealers find the line a profitable one. Why not You? Our catalog is full of good things. Write for it Now.

IT is all very well to have decided opinions—that is a token of mental strength—but to blind your eyes to the opposite viewpoint is a sign of a narrow mind. The man who cannot see the other fellow's side of the story as well as his own is the one whom progress leaves behind. The man who is unalterably convinced that his opinion is the only right one is outstripped in the climb to success by his opponent who sees both sides of the question.

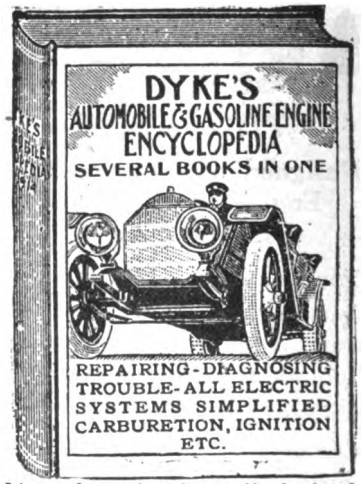
NEW ADDITIONS

TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

Don't Wait Until Afterwards

Auto Smash! 3 Killed, 2 Fatally Injured. Due to Mistaken Signals.

This happens every day.

When will your turn come?

Prevent the accident by providing your car NOW with the

SMITH AUTO SIGNAL

It eliminates hand-signaling and tells definitely, positively and unmistakably what you are going to do. The burden of proof is then on the "other fellow." Don't wait until afterwards.

SMITH SIGNAL CORPORATION, Mfrs.

WEISS & SINCLAIR, U. S. Distributors

53-55 West 66th Street New York

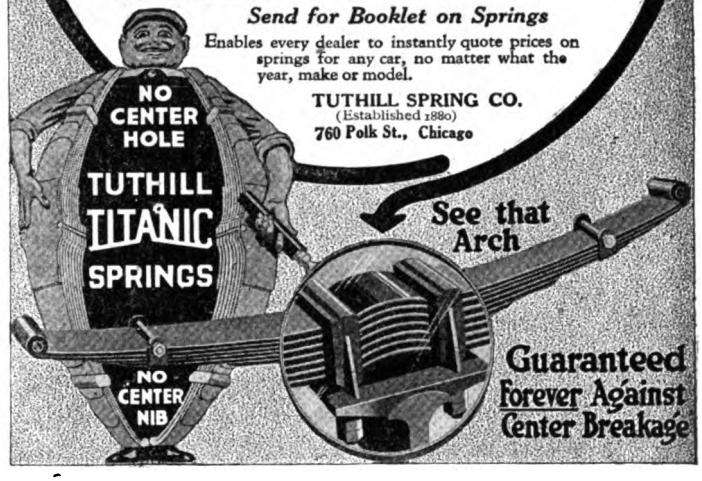
(Representatives wanted)

REAR VIEW

Note how Smith Auto Signal shows to front and traffic policeman as well as to rear.

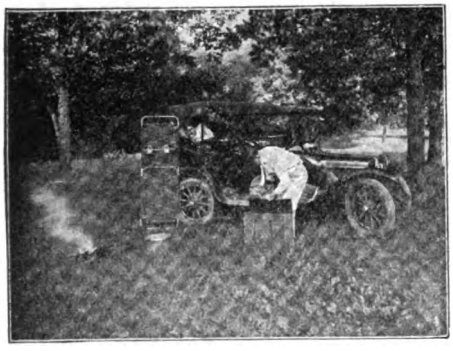
STOP
Selling Weak Springs

Don't sell your customers springs that break. Sell the one spring that never breaks—the spring with the extra guarantee.



GUARANTEED TUTHILL TITANIC SPRINGS LUBRICATED

are guaranteed at all points and in every respect for one year and in addition are guaranteed *forever* against center breakage, where 3 out of 4 old fashioned springs break.



Send for Booklet on Springs

Enables every dealer to instantly quote prices on springs for any car, no matter what the year, make or model.

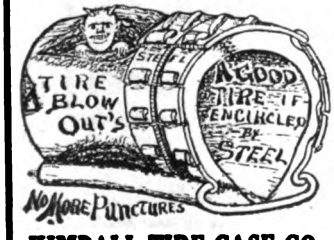
A KOT THAT FITS ANY AUTOMOBILE

The Any-Kar Auto Kot is the simplest, most inexpensive, and comfortable sleeping bed, that rests over the tops of the rear and front seats. One or two of these kots will fit into any five or seven passenger car. Special size for Fords. The kot is furnished with a heavy ducking and folds to a small package and can be carried while touring the same as a grip.



Price $12.00, f. o. b. Peoria

Manufactured by the

PEORIA AUTO KOT COMPANY,
PEORIA, ILL.

Hang on to your old tires. They will last as long as you live if covered with steel. **The Kimball Steel Protector** makes **Blowouts, Punctures** and **Rim Cuts impossible.** A few sections will hold any old blowout. Tires as flexible as ever.

Special inducements to those in new territory.

MUD CHAIN can be put on in a jiffy with one hand while standing on the run board. If you get in a mud hole you will laugh out loud. Hook the ends together and pull the little lever and they are on tight. Good for blowouts.

KIMBALL TIRE CASE CO., 174 Broadway, Council Bluffs, Iowa

B-W DIRECT CURRENT

STURDILY CONSTRUCTED to retain accuracy under the most severe conditions. Handsome in appearance. Made in both flush and surface types. Finished in bright nickel or black rubberoid as desired.

Have You Had Trouble With Your Tires?

The fault is not with the tires. You, or your chauffeur, or both, are to blame. The responsibility is yours because you should keep the tires pumped up to a specified pressure, and don't.

Tires that are kept up to the proper air pressure last twice as long—sometimes ten times longer—than tires that are run with not enough air in them. Measure your air daily with a

SCHRADER UNIVERSAL TIRE PRESSURE GAUGE

and get out of your tires all the miles they can give.

Price in U. S. A. **$1.25**

MUNICIPAL PIER
CHICAGO

Scene of the
NATIONAL TRUCK,
TRACTOR AND ACCESSORIES
EXPOSITION

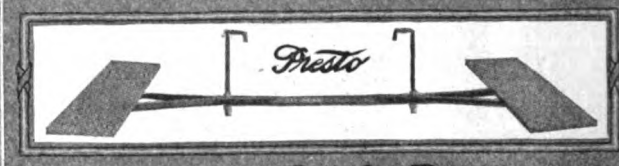
September 14th to 21st, 1918

TRUCKS—

This will be America's most representative war-time truck show—embracing the giants of transcontinental fame and the little local delivery hustlers. Trucks are in the lime-light because of their great service at the front and at home—and all the best trucks will be shown at the Municipal Pier from September 14 to 21.

TRACTORS—

Greatest ally of the Allies—all the giants of the farm and battlefield on display. Small tractors, large tractors—America's representative tractor manufacturers will participate in this great exposition—Municipal Pier, Chicago, September 14 to 21, 1918—a stimulant to the broader agriculture necessary to meet war-time needs.



ACCESSORIES—

A big part in war-time conservation is being played by automobile accessories which increase efficiency—mileage and service—and decrease cost of upkeep and operation. The accessories shown at The Pier, September 14 to 21, will bring home to everyone the tremendous strides which American manufacturers have made toward helping to win the war.

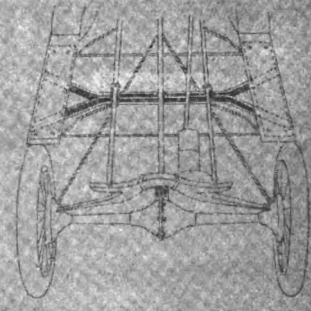
The New
Presto Necessity

Presto Body Brace
and Running Board Support *for* Fords



THE **Presto** Brace—strong as a bull because built scientifically like a trussed steel structure—read these ten important reasons why it is a real necessity for Ford Cars.

Stops vibration.
Avoids sagging of running boards and
Prevents their breaking away from fenders.
Prevents broken springs.
Prevents side swaying.
Prevents uneven strain.
Holds drive-shaft in position.
Holds all mechanical parts in alignment.
Equalizes spring action.
Easily installed; no holes to drill, no mechanic necessary.

Once used, it is practically indispensable because it enables you to carry 800 pounds on either running board if necessary without injury to your car. Dealers are amazed at the unprecedented success with which the Presto Brace is meeting.

Price only $3.50 in U. S. A., except west of the Rockies, $4.00. In Canada, $6.00. Satisfaction guaranteed. Order from your jobber, or write direct to us, if he cannot supply you.

DEALERS—Here's a new one that's getting over big. Write and ask us about it. **Satisfactory discounts.** Write for literature and cuts of all new products. Presto products mean bigger profits through increased sales.

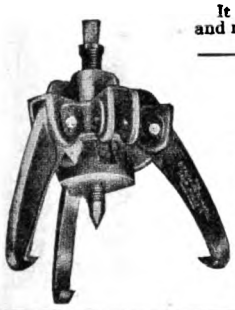
GREB



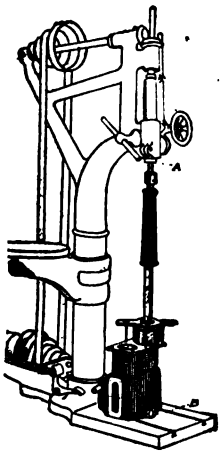
Automobile Accessories and Garage Tools

GREBFORD EXTENSION FOR FORDS

The Grebford *Unit* will lengthen Ford cars in an hour's time. Wheel bases 112, 115, 118, 124, 130 and 136 inches. Capacity 1,000 to 1,800 lbs..

It is not necessary to even cut or disturb the Ford frame. Shipped all assembled and ready to be instantly installed. Write us today for full particulars.

BEACH AUTOMATIC GRIP PULLER



Quick, Strong, Durable, Efficient and Simple. Can be locked in any desired position. Positive grip, cannot unhook, and adjusts to work instantly. Three long arms are also furnished, (12 in. from bell crank to hook which open to 18 in.) Flat end screw. Gilt edge guarantee of highest possible quality and insures extreme satisfaction to the users.

BEACH UNIVERSAL RIM TOOL

It opens the rim ¼ inch. It raises one end two inches and carries it over and by the other four inches, thereby contracing the rim. It swings by center and the spring of the rim holds and locks it in the contracted position, so that the tire may be removed. After the tire has been repaired and replaced simply reverse the operation and the rim is forced back to its correct position. It actually contracts and holds the rim, then expands and locks it in its true position in one operation without removing or changing the position of the clamps.

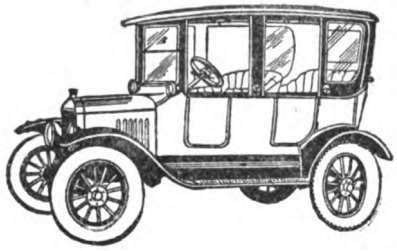
DETROIT DETACHABLE WEATHERPROOF TOP



Storm Tight—Wind Proof—Dust Repellent

ELIMINATES instantly all the Ford drivers' former hardships—no bothersome side curtains to adjust in the biting cold or blinding snowstorm. No change made in the standard body. Entire top can be attached by anyone in a few hours.

It is the only patented all-weather top that does away with the objectionable features of a detachable top and affords the car owner an enclosed or open body for year-round use at a really low price.

It is absolutely rattle proof and will last as long as the car.

Just One of the Exclusive Features
of this convertible type top is the patented flexible, easy sliding doors, which disappear into the roof and increase the size of regular Ford doors 3 inches.
For the other 9 big improvements, see our literature—write us today.

A Fine Fall and Winter Proposition for Dealers

BLACK & DECKER

LECTROFLATER

ELECTRIC AIR COMPRESSORS

GIVE CLEAN PURE AIR QUICKLY!

RAIN OR SHINE—IN THE GARAGE,
ON THE CURB—IN THE STREET—ANYWHERE

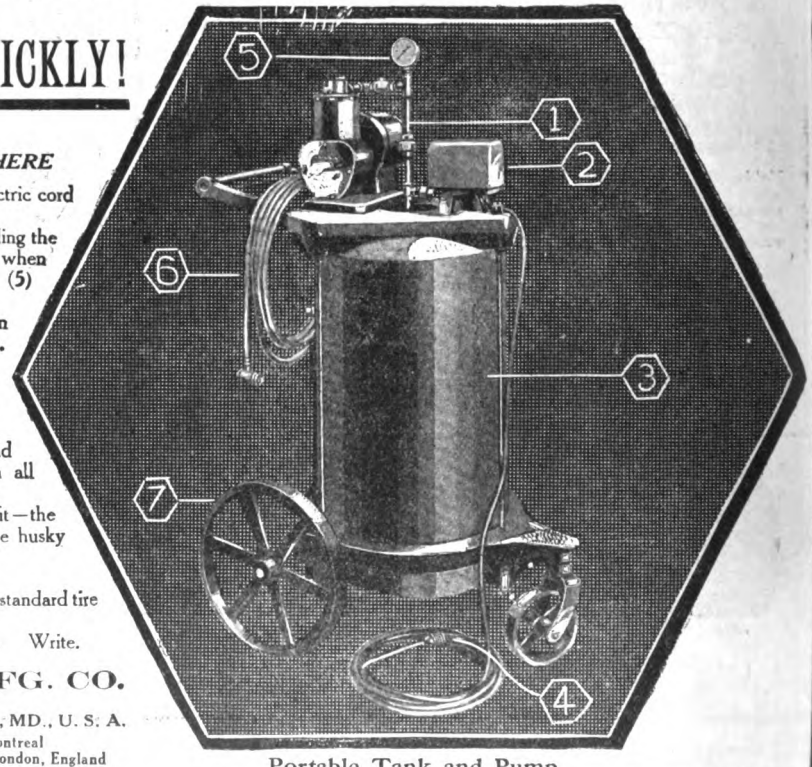
The Lectroflator can be filled by simply attaching the electric cord connection (4) to a convenient electric light socket.

Automatic Pressure Switch (2) starts the compressor refilling the tank when the pressure drops to 130 pounds and cuts out when 150 pounds pressure is reached. The large accurate gauge (5) indicates the tank pressure at all times.

The Lectroflater is always ready with a load to fill ten average tires at a cost of 1/10 of a cent each in current.

The Pump itself is lubricated with grease—not oil (1) which means there's no oil level to maintain, and it's air cooled by forced draught so there's no liquid to freeze or evaporate.

All working parts housed and protected against dirt, grit, and rough handling. The tank (3) is welded and brazed in all seams and is tested to 300 pounds hydraulic pressure.



It's handsome—this Lectroflater Pump and Tank Outfit—the finish is green and black enamel with nickel trimmings. Large husky metal wheels (7) are furnished for hard service.

Twenty-five feet of high pressure hose (6) fitted with standard tire chuck—goes with each outfit.

Catalogue, electrotypes and mailing literature available. Write.

BATTERY CHARGING PAYS BIG PROFITS

HB

This new 32 battery equipment is designed especially for garages and battery service stations where large capacity is required to meet the ever increasing demand for battery charging. Amply designed 5 H. P. motor operates from city current, charging 32 6-volt batteries or equivalent at one time. Four separate charging lines and panels permit individual attention to every battery.

Bigger capacity means *lower operating* cost and *bigger profits*. It is wise, therefore, to figure ahead and install equipment with capacity to meet future requirements. Write at once for full information and terms under which outfit should easily *pay for itself* while you use it.

32 Battery Capacity Charger

Shipped Under a Guarantee of *Absolute Satisfaction* or Money Refunded.

YOU RUN NO RISK

We furnish also smaller capacity outfits or belt drive where city current is not available.

USE KEROSENE

DRIVE YOUR CAR TWICE AS FAR AND BUY YOUR FUEL FOR LESS THAN HALF.

OFFICIAL TEST
DETROIT AUTOMOBILE CLUB
June 4, 1918.

UNDER instruction of Mr. W. S. Gilbreath, manager of the club, I acted as observer of a test run made with your Kerosene Equipment on June 3rd.

The equipment in question was attached to a 1914 Model T Ford, which was not in the best mechanical condition at the time.

One and one-fourth gallons of Kerosene were consumed in the test, a distance of 37 7-10 miles being traversed, much of this on ordinary country roads. About eighteen miles of the trip was through fairly heavy traffic. A speed of 22 miles per hour was maintained.

Performance of the car was equal to, if not better than could have been done on other types of fuel.

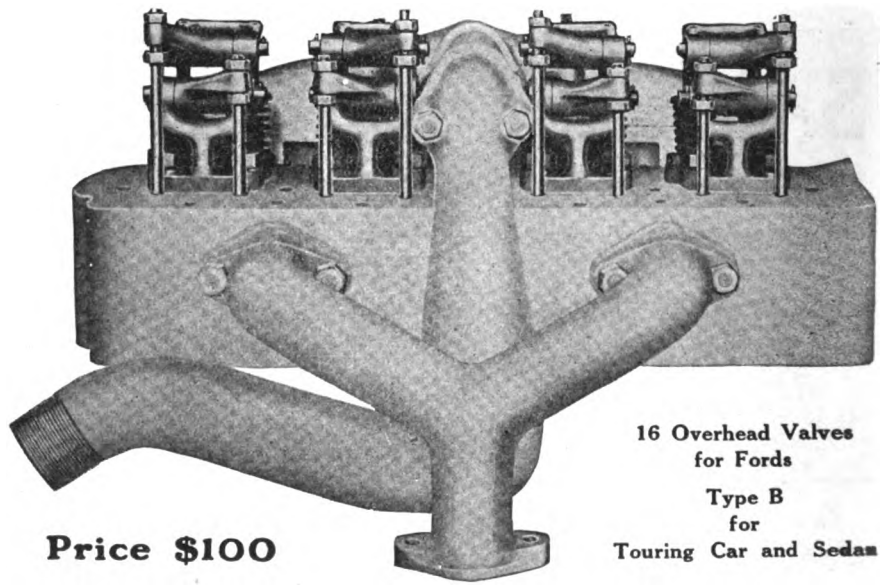
DETROIT AUTOMOBILE CLUB,
E. W. SULLIVAN, Observer.

BUY NOW

Order direct from this advertisement. Enclose purchase price, $25 for complete Equipment on 30 days trial.

If you find it doesn't do all that you expect—if you think it isn't an *immense money saver*—return it within a month from date shipped, and get your money back. No risk. Send order today on *25 miles minimum per gallon kerosene Guaranteed.*

C. O. D. orders must be accompanied with $5.00 payment.



A USER SAYS: "We have certainly gotten some positively wonderful results out of this carburetor and would not go back to straight gas on a bet." "THE HUNTLEY," Winona, Minn., May 23, 1918.

$3

per set of 3

Outwears several sets of ordinary linings

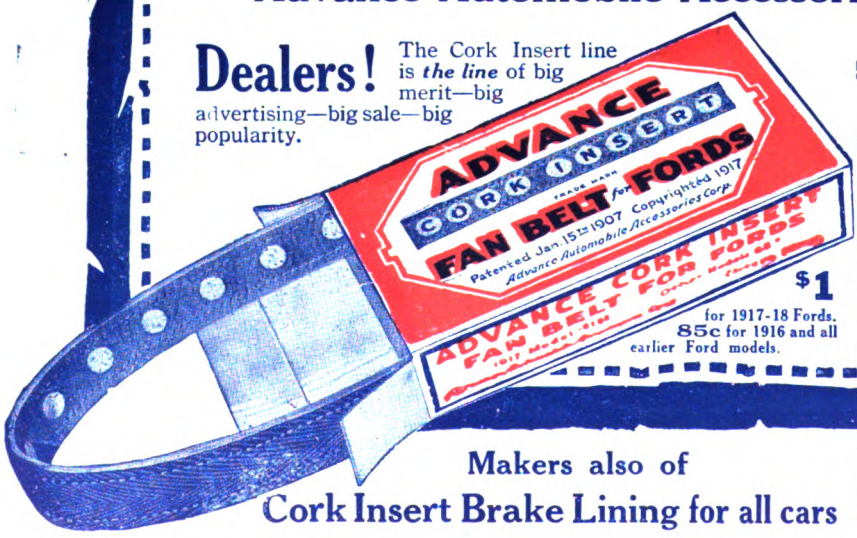
The red box identifies the genuine

CORK INSERT

Transmission Lining for Fords

The success of Cork Insert has resulted in a swarm of inferior imitations. Some imitate the name, some the idea, some the box. Be sure to *get the genuine.*

DON'T TAKE CHANCES when you KNOW the genuine Cork Insert Transmission Lining can be *depended upon* to give *smooth, even friction* to the last mile of service—end grabbing and slipping—give *sure* braking efficiency—and to last so long that it's cheapest in the long run.



We warn you especially against lining in which metal is used. Metal in contact with the transmission drum of the Ford will not only cause chattering of the worst kind, but damage to the drum. Tiny particles of metal worn off by the friction are apt to cause short circuits.

You can easily identify the original Cork Insert by the name "CORK INSERT" and the RED BOX in which it is always sold. *Ask* for Cork Insert and *accept nothing else.*

"The Nation Knows the Alamo"

ALAMO ELECTRICITY

These Profits for You

THE ALAMO Farm Light and Power Unit will turn a profit leak into a profit builder, keep you in close touch with America's greatest wealth producer — the farmer — and maintain a sales volume that will replace losses caused by the many radical changes war has brought.

The clipping reproduced is from high authority. It is a convincing argument for the ALAMO agency. There never was a more logical time for the selling of electric light and power equipment for the farm. The labor shortage makes work-reducing utilities a necessity. The farmer's increased income brings a desire for comfort-giving equipment.

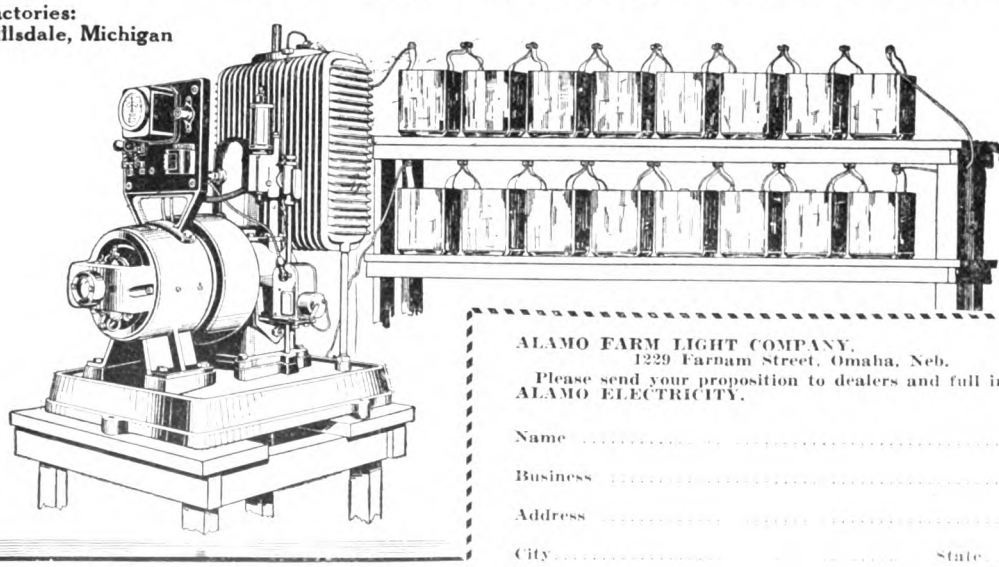
Forced to be Rich

UNUSUAL conditions brought about by the war make it necessary for every farmer to speed up, and to make more money than he has ever made before.

The farmer is actually being forced by the Government to make larger profits than he has ever made before.

Once the farmer is geared up to this high pitch, has had money and enjoyed spending it, he will maintain this large production.

Even after the war it will be many years before European countries have become readjusted so they can supply their own needs in the food line.



Therefore, the American farmer will have a big market for a great many years to come for all the crops he can raise, and at high prices.

Send for ALAMO Dealer Proposition

The attached coupon is for your convenience in securing valuable information about the ALAMO agency. It brings full details about the ALAMO Unit — a money-making addition for your business. It brings the ALAMO dealer proposition — a sales-making plan. Get these facts now. Sign and send the coupon today — or use a post card or letter if you prefer.

MUNGER "Always Tight" Piston Rings

The MUNGER "Always Tight" PISTON RING OUTFIT—
8 Regular Size Rings 1 Regrooving Tool
4 Over-width Rings 1 Ring Insertion Tool

Give more power
Save gasoline
Save oil
Stop plugs fouling
Stop engine smoking

You will see the difference almost immediately.

Within thirty minutes after you start your engine Munger "Always Tight" Piston Rings will seat themselves perfectly. (The little oil grooves do it.) And once seated, waste and other troubles resulting from compression losses are forever ended.

These rings remain *permanently gastight* because the patent process of peening them makes them conform to the shape of any cylinder (even though worn out-of-true), and the "Always Tight" Expansion Joint compensates for all wear as it occurs without leaving any opening through which gas can escape.

Being made in one piece, they are not susceptible to the ailments of more complicated rings.

Try them! If they do not fulfill all our promises—if they do not do all that is claimed for other rings—if for any reason they do not give you satisfaction, return them within thirty days to the dealer from whom you got them, and he will gladly give you your money back.

The old way

The new way

A man should not do the work a machine will do for him

A merchant, with all his troubles, should never do the work that a machine does better and quicker.

Our newest model National Cash Register makes the records which a merchant needs to control his business. It does fifteen necessary things in three seconds.

Without the register a man cannot do these things in half an hour.

With the register, even a new clerk can do them just by pressing the keys.

Our new electric machines are as much better than old machines as an up-to-date harvester is ahead of a sickle for cutting grain.

The latest model National Cash Register is a great help to merchants and clerks.

It pays for itself out of what it saves.

Merchants need National Cash Registers now more than ever before

FILL OUT THE COUPON AND MAIL TODAY

Dept. 704, The National Cash Register Company, Dayton, Ohio.

Please give me full particulars about the up-to-date N. C. R. System for my kind of business.

Keep Your Liberty Bonds

HOLD to that bond. You invested to help send the boys across. They are over now, at grips with the German monster. You expect them to hold on—hold on till the last vestige of autocracy is crushed out of him. Then you, too, must hold on—must keep your enlisted dollars invested on the fighting line.

It isn't the hooray of a campaign that wins a war. It's the will to hang on, to make sacrifice today, that tomorrow may bring victory.

And your investment. Those bonds are the safest investment you ever made. Don't be lured into exchanging them for the "securities" of some suave get-rich-quick operator. Big returns may be promised, but the bigger the promised returns the bigger the risk.

If you have to have money, take your bond to any bank and use it as collateral for a loan. There is no security the banker would rather have—nothing on which he will lend more willingly.

Don't use bonds to buy merchandise. The average merchant, accepting your bonds in trade, sells them immediately, thus tending to lower their market price and taking away from the buyer of your bonds the ability to lend a corresponding amount of money to his Government. Liberty Bonds are meant to help your country at War; are meant for investment and to provide an incentive for saving and a provision for the rainy day.

Hold fast to your Liberty Bonds. Hold fast for the sake of the boys "Over There". Hold fast because it is good business.

The Right Men in the Right Jobs Will Win The War

THE true American wants to work where he will help win the war. He wants to fit in. America needs the Right Men in the Right Jobs. Only when this comes about can maximum production be obtained to support our armies at the front.

The needs of all war industries can be anticipated and met by the Government if employers and laborers will avail themselves solely of the nation-wide machinery which is at hand. The length of the War depends directly on our Country's ability to supply all War Industry with the best workers the country can produce the moment they are needed.

PRESIDENT'S STATEMENT

"Industry plays as essential and honorable a role in this great struggle as do our military armaments. We all recognize the truth of this, but we must also see its necessary implications—namely, that industry, doing a vital task for the Nation, must receive the support and assistance of the Nation."

* * *

"Therefore, I solemnly urge all employers engaged in war work to refrain after August 1st, 1918, from recruiting unskilled labor in any manner except through this central agency [the U. S. Employment Service]. I urge labor to respond as loyally as heretofore to any calls issued by this agency for voluntary enlistment in essential industry. And I ask them both alike to remember that no sacrifice will have been in vain, if we are able to prove beyond all question that the highest and best form of efficiency is the spontaneous co-operation of a free people."

WOODROW WILSON.

The U. S. Employment Service is the official bureau of the Federal Government in charge of the distribution of labor. The President has declared that it is the official agency for recruiting and distributing unskilled labor for war work.

It has over 500 branches throughout the nation, and 20,000 U. S. Public Service Reserve enrollment agents. Ask the local post office or newspaper for name and address of the nearest representative, or write to the U. S. Employment Service, Washington, D. C.

Those employers in war work who seek to get labor through their own or private recruiting agencies are interfering with the Government's machinery and preferring their interests to those of the nation. Only through strict compliance with the Government's program can the constant, restless shifting of labor from one war job to another, with the consequent diminution in production and efficiency, be prevented.

Above all, the Government urges every man engaged in war work to stick to his job until the Government recommends that he change. Any man not engaged in war work should put himself at the disposal of the nation by registering with the Public Service Reserve. This is a tremendously important duty! The war worker ranks with the fighter in the trenches. He will help beat the Hun.

Bespeaking Patience

It has become necessary to advise prospective purchasers of the Weston Model 280 Garage Testing Instrument that deliveries can no longer be made promptly. Under present war conditions, there are unusual requirements which must receive our consideration in advance of commercial orders.

For this reason, we can accept your order only on the basis of delivery when possible. We suggest that you place it as early as you can.

Appreciating fully the needs of our customers and that the radical superiority of the Weston Model 280 Garage Testing Instrument is now well known to the Garage and Service Station men, we promise to execute orders in the order of their receipt and as quickly as conditions will permit.

We are confident that this frank explanation of the situation will be accepted by prospective purchasers in the co-operative spirit in which it is submitted.

U. S. Government Orders big cut in production of new tires and tubes. That means Dealers must do More Tire Repairing

WAR TRADE BOARD BULLETIN of August 1st to tire manufacturers states:

"You are hereby notified that during each of the months of August and September, 1918, that in the manufacture of pneumatic tires and tubes you shall restrict the production in tonnage of rubber consumed and in numbers of casings and tubes to the extent of 50% of the production for the corresponding months of August and September of last year.

"In no event shall your manufacture of pneumatic casings or tubes, during the month of August, 1918, and the month of September, 1918, exceed 50% of the monthly average of 1917 both as to the amount of rubber used and number of pieces produced. This restriction is exclusive of Government business."

THIS MEANS that every car owner *must* have his old tires and tubes repaired over and over again to yield the last bit of mileage before discarding them. And it opens up the Biggest Opportunity in history for larger and more profitable business in tire repairing. Grasp this opportunity by installing

Akron-Williams

TIRE REPAIR EQUIPMENT

Used, Recommended and Sold by All Leading Tire Companies

Most Complete Line

There is an Akron-Williams outfit for every size shop and a machine or tool for every purpose in tire and tube repairing. No equipment is too large—no tools too small.

Every piece of our equipment has been designed and perfected with the co-operation of engineers employed by the leading tire companies; and the outfits we offer you are the same as used in over 100 tire factories and sold to Dealers all over the world.

Prompt Shipments

We have recently completed a large three-story addition to our plant, devoted wholly to the manufacture of equipment for repairing and re-building pneumatic tires and inner tubes.

With these increased facilities, we can now make practically *immediate shipments* on all orders.

War time is Tire Repair Time.

Don't let someone else get your share of these New Profits. Prepare now.

Johns-Manville

It's the Asbestos that Determines a Brake's Reliability

MANY times a day safety depends wholly on the grip of the car's brake linings. Probably they're of ASBESTOS—but don't rest content with that assurance, for ASBESTOS varies.

It's the quality of the fibre that counts—and many tons of ASBESTOS must be sorted over for a ton of suitable brake lining fibre. The way to make safety sure is to insist on NON-BURN, made at ASBESTOS Headquarters—a Johns-Manville Product from mine to market.

We take thousands of tons annually from our own mines, and, as the world's largest producers and manufacturers of ASBESTOS, we can pick and choose. NON-BURN wears, and is safe and sure, simply because we put into it only strong high-grade fibres specially selected for brake service.

Have You Any War Orders?

If You Have Not, You Must Get Some

Automobile manufacturers are loading up with them, and motor car production is automatically slowing down in proportion.

Self-preservation should show you the necessity for diversifying your business as much as possible.

You can do this and help the country at the same time.

Put it the other way: Help your country and prosper.

Take the great question of food production; where do you fit in?

Farm tractors mean more and better crops. The war has jumped the tractor proposition twenty years ahead of a normal, peace-time basis.

Get busy on the tractor end. Study the subject. Get in right.

Other things that help the farmer may legitimately be a part of your stock.

His cars, his trucks, his motor equipment—including farm lighting outfits—all these things and many more work in with an Automobile Accessory Dealer's selling system.

The farmer—the country—the dealer—all are vitally interested in bigger production and bigger business all around.

So go after your sort of war orders; the call is imperative.

Published in the interest of the Dealer by the National Association of Automobile Accessory Jobbers

Our booklet—"How to Run a Garage"—is free for the asking—it's practical, helpful reading, that gets right down to cases

Why—

IT'S MONEY in your pocket when you can establish a reputation for rapid service among car owners in your neighborhood.

That is one reason why you should push Harvey Springs

Besides rapid service, the product you sell must be of good quality, honestly made.

That is another reason why you should push Harvey Springs

A product that has made a name for itself and has gained the good will of car owners is much easier to sell.

That is still another reason why you should push Harvey Springs

You will generally find that a product in which you, yourself place absolute confidence a product you feel sure of, is easy to dispose of at a profit.

And that too is a reason why you should push Harvey Springs

Satisfaction to car owners — satisfaction to dealers — that is the ideal combination.

And that is the final reason why you should push Harvey Springs

THERE'S A HARVEY JOBBER NEAR YOU — Write us and we will send you his name and address, and our latest catalog, giving complete specifications of over 900 different styles of Springs.

Write today — you may need Harvey Help tomorrow.

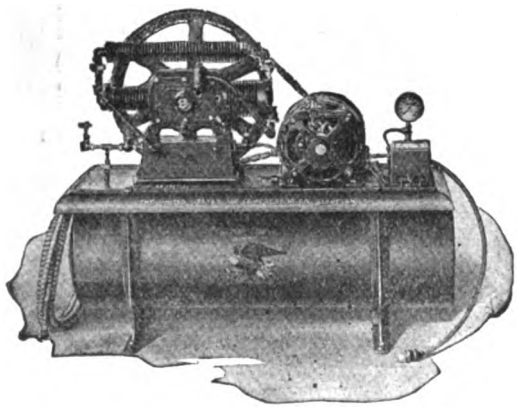
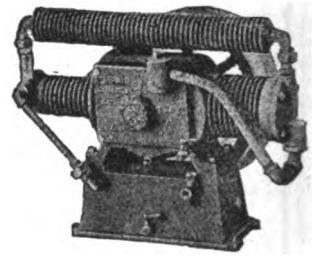
Easy Cutting Taps and Dies



Little Giant taps and dies are sharp, clean cutting tools. The dies are adjustable and can be reversed to cut close to a shoulder.

Greenfield Tap and Die Corporation
Greenfield, Massachusetts
New York, 28 Warren St. Chicago, 13 S. Clinton St.
Detroit Office, 74 Congress St., W.
Canadian Factory, Wells Bros. Co. of Canada, Ltd., Galt, Ontario

No. 311 set (illustrated) contains taps and dies for cutting both U. S. and S. A. E. standard threads from ¼ in. to ¾ in.—an ideal set for the garage. Other assortments shown in catalog.



The United States line comprises 20 different numbers in Two-Stage and Single-Stage Types, and various individual equipment adapted for forming combinations of almost unlimited kinds and capacities.

The World's Best Air Compressor—The U. S. De Luxe Two-Stage Automatic Air Unit. Contains 14 noteworthy refinements and improvements. The Ideal unit for free air stations, garages and tire shops. Capacity, 4 cubic feet per minute. Completely self-contained.

Consider the Judgment of Millions of Autoists

A SINGLE-CYLINDER (single-stage) hand pump is now rarely, if ever seen. Automobile owners have learned the superiority of the compound (two-stage) pump, and the single-stage device has just naturally passed out of existence.

If garage and tire repair men would consider these facts in purchasing a power air compressor, few would buy anything but a **two-stage** compressor.

If the two-stage principle is superior in the hand pump, it is obviously superior in the power pump. This is specially true of United States Two-Stage Air Compressor because, while utilizing the same proven principle as the hand pump, they contain no stuffing boxes (the one objectionable feature of hand pumps) and furthermore, because they are improved in 14 other important details. The catalog describes all these features in complete detail. Everyone should have a copy. Send coupon for yours today.

Stop This Waste!

Over 200,000 Gallons of Gasoline Escape from Tank Vents Daily.

More than one-fifth of all the Government's daily war needs of gasoline is wasted by evaporation or splashage through the vent holes of tanks on automobiles, trucks, tractors, motor boats and stationary engines. Conclusive tests at Armour Institute and the Associated Engineering Laboratories have established the existence of this waste, and proved that it can be stopped by equipping a car with an

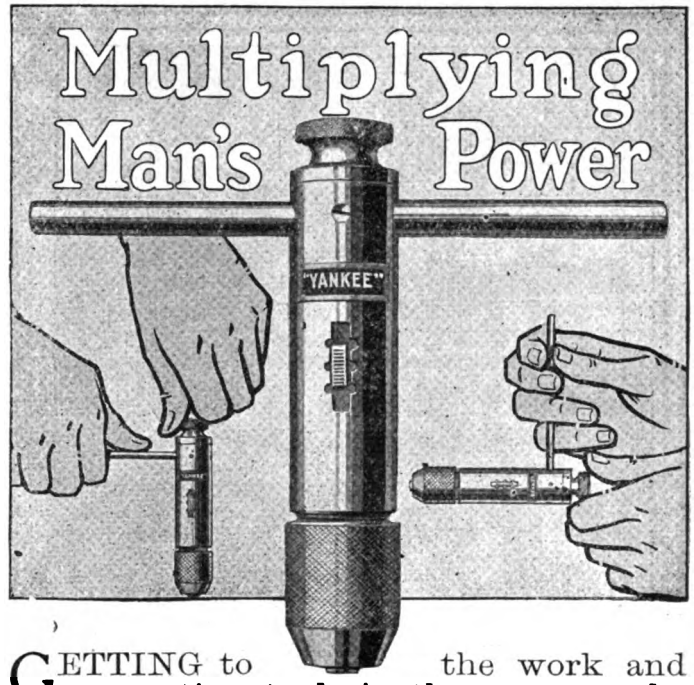
Imperial Gas-Tank Seal

Dealers and garage owners everywhere will build up good will and make increased profits by showing motorists how to save from $12 to $40 a year and get more mileage by equipping their car with the Imperial Gas-Tank Seal.

Easily installed — simply bore a ⅜-inch hole in the filler cap—cannot get out of order and works equally well with either Gravity or Vacuum Systems. The valve admits air automatically, to replace gasoline used through the carburetor.

When ordering Imperial Gas-Tank Seal, state whether it is for Gravity or Vacuum Feed Systems. We shall be pleased to mail you our Free Pamphlet, "Where the Gasoline Goes," on request.

THE IMPERIAL BRASS MFG. CO.
520 S. Racine Ave. CHICAGO



Cold weather is approaching—now is the time to stock up on the Imperial Primer. Motorists everywhere will want one. Cars thus equipped will start instantly in cold weather regardless of grade of fuel used. Complete and easy to install. Price $5.50 to $6.00 complete. Full details on request.

Jobbers and Dealers: Write for full information.

$3.50 Prepaid.
$4.50 in Canada.

Multiplying Man's Power

GETTING to the work and operating tools in the many nooks and corners of a car are the auto mechanic's big problems. His time and energy must be saved—now more than ever.

The "YANKEE" Ratchet Tap-wrench, with the famous "Yankee" Ratchet Movements, makes it easy to tap holes in close quarters where interfering parts render it impossible to use an ordinary tap-wrench without taking down the construction.

Three positions of the Ratchet Shifter give Left-hand, Right-hand or Rigid adjustment as desired—enabling you instantly to adapt the tool to any situation. A working efficiency on difficult jobs that can't be equalled with other tap-wrenches!

"YANKEE" Ratchet Tap-wrench

The cross-bar is held central, or at either end, by a friction device. Or you can remove it entirely—as for close packing in tool chest. Has knurled thumb-piece at top, to start or back out taps quickly; and counter-sunk hole for centering and revolving tool on lathe.

No. 250 — Length, 3¼ in.; Diameter of Chuck, ¾in. Holds up to 3/16 in. taps..... **Price, $1.70**

No. 251 — Length, 5 in.; Diameter of Chuck, ⅞ in. Holds up to 5/16 in. taps..... **Price, $2.40**

No. 1251 — Length, 13 in.—for work requiring long reach—otherwise same as No. 251 **Price, $3.00**

Your dealer can supply you

The

CONNECTICUT

Flush Dash Kick Switch is Built for Rough Usage

The average truck driver is more apt to use his feet than his hands for manipulating the ignition control, and it takes a pretty husky type of switch to stand up under such handling.

That is why the Connecticut Flush Dash Kick Switch has found such general favor for truck installations. Not only is it one of the most compact ignition controls ever devised, but nothing about it projects beyond the face plate of the dash, except the lever. This lever, besides being sturdy enough to withstand the most strenuous handling, is removable, thus acting as a lock for the ignition system.

Type "B", with positions "Off", "Bat"—for battery systems, $1.25.

Type "M", with positions "Off", "Mag"—for high tension magneto systems, $1.25.

Type "MB", a four-position switch for two independent systems of ignition, with positions "Off", "Bat", "Bat" & "Mag", "Mag".

The type "MB" switch meets with the War Department's specifications for truck ignition equipment in every detail.

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

Quality—a thing sought after by every car and truck builder—a thing intangible, almost indefinable, but the most desirable element in a car or truck. One thing, however, is sure—quality must be consistently uniform throughout every part, every accessory, and every part of every accessory. There can be no minor flaws in the perfect jewel of high quality.

"NORMA" High-Quality Bearings are the standard bearings in those high-quality magnetos and lighting generators which are found so consistently good as to be the standards on high-qualing cars and trucks. "NORMA" Quality explains.

The Only Scientifically Correct Roller Bearing for Fords

After continued tests in actual service a common fault in all taper roller bearings for Fords was discovered. The inner ring, being subjected to a continuous twisting strain, has a tendency to move out of position and thus ruin the bearing. Inability to provide a proper seat for the bearing is the primary cause of this trouble. With this fault in mind the Wright Bearing was improved by the addition of a second surface (see cut). This second surface being at right angles to the other, holds the bearing firmly in place and makes it absolutely impossible to move.

A glance at the cuts will show the firm manner in which the Wright ring is seated in the hub and a comparison of the Wright ring (at top) with a general type of ring (at bottom) will show the radical difference in construction.

The fundamentally correct design of the Wright Bearing makes this feature (on which patents are pending) possible to the Wright type alone. No other bearing can have it without changing the entire design of the bearing itself.

Thus the Wright Bearing, which embodies the correct fundamental principles of bearing design, has added another exclusive feature to an already proven superior product.

Ask your dealer or jobber to show them to you

89 pages and 291 illustrations on Engine and Parts.

16 pages on Digest of Troubles.

6000 lines to the Index. This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. Index begins on colored paper, easy to refer to.

Dictionary is also included, which gives the meaning of motoring terms.

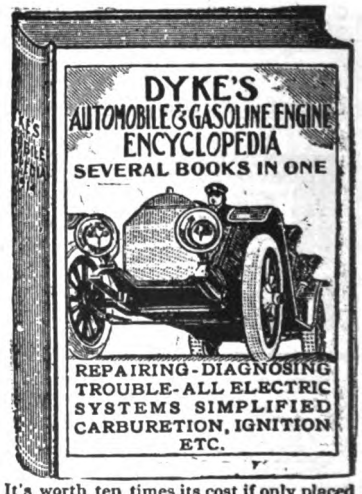
Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS

TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

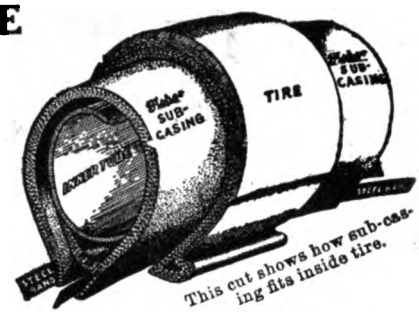
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.



A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

FISHER MANUFACTURING CO.

1706 PAYNE AVENUE, :: :: CLEVELAND, OHIO

This cut shows how sub-casing fits inside tire.

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

IMPORTANT POINTS ABOUT PAINT AND VARNISH BRUSHES

A Set of Three Brushes and the Automobile Dealer and Repairer for One Year for $2.00

Brushes Needed in Repainting and Varnishing an Automobile.

Did it ever occur to you that there was much difference between a good paint or varnish brush and a poor one? Probably not. To most people a brush is just a brush. Yet an analysis shows that there is an almost measureless difference between a good brush and poor one.

For instance, a properly made Flowing Fitch brush is hermetically sealed, so as to keep the paint, or whatever may be used, from getting into the brush at the top and loosening the hairs. All such properly made brushes are solidly set in glue cement inside a leak-proof ferrule, and a whole row of neatly clinched nails are driven in at the end of the ferrule to give added security, and a guarantee that the hairs will not pull out.

A Fitch brush is *smooth, soft*, and *flowing*, and does not "mush" up or get flabby like a cheap brush, but holds its springiness. The trouble with cheap brushes is that the ferrule is nothing more than a single band of tin, open at the top, with a couple of nails jabbed through. When you use such a brush the cheap hair will pull out and scatter all over your work, because it is not held in securely enough to stand the drag of the brush in painting or varnishing.

A brush may be washed with gasoline or kerosene oil, but to clean it thoroughly turpentine should be used. No brush used for painting should be used for varnishing.

We have recently made arrangements with one of the best manufacturers of these properly made brushes in New York to offer a set of Three in connection with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year for an even $2.00. These brushes sell at retail for $1.40. It will be seen, therefore, that there is a substantial advantage in sending to us for the AUTOMOBILE DEALER AND REPAIRER for a year, and for a set of these brushes.

Present subscribers can have their subscriptions extended for a year, and secure a set of brushes, on the same terms. These brushes are guaranteed in every respect, and though they cost more than cheap brushes would cost, they are far cheaper in the end, because of their lasting qualities and the good work that can be done with them. No man can afford to waste expensive paint and varnish on an automobile by using a cheap and poorly constructed brush, such as is usually to be found wherever brushes are sold. The ordinary dealer in brushes himself as a rule has very little knowledge of the quality of the brushes he sells.

Remit by check or money order, and your name will be entered as a subscriber to the AUTOMOBILE DEALER AND REPAIRER for a year, and a set of these brushes, which are just the right size and shape (see illustration, which is exactly one-half the actual size of the brushes,) will be sent to you, postage prepaid.

Sick Cars and the Diagnosis of Trouble

How One May Find and Cure the Various Engine Troubles Commonly Occurring. The Last of the Sick Car Series

EVERY time I take a walk in the street and see abused automobiles limping along, I am prone to think of them as people. Every time I ride in an automobile, hear its grumbling and its moans, the resemblance is brought home to me strongly.

I have a neighbor who is a God-fearing man and looks as though he might be extremely kind-hearted as well as benevolent. The dogs on the street are his friends and I seldom hear him speak a harsh word to his nearest relative, his wife. At the same time, however, I will admit that I am a bit prejudiced against the gentleman. If there were a society for the prevention of cruelty to automobiles, my neighbor would soon find himself caught in its toils.

He has no mercy for his machine and I really believe if his automobile happened to lose three wheels, he would try to get home upon the fourth. I often wake in the middle of the night, my hair standing upright and a chill running down my spine, cold sweat on my brow, all from horror at the fearful moaning and wailing of his machine which he is enticing into his garage.

An automobile is very much like a person. Its years of life are short, but into these years are often crowded much kindness and usefulness for man.

Automobile sickness and ills may be divided into two great classes, nervous disorders and stomach trouble. Stop and think a minute and see if you can make any other classification than this. If an automobile engine stops it stops either because the ignition system has gone wrong or because it is not getting a sufficient supply of gas.

Now don't misunderstand me. I said automobile sicknesses. I didn't say automobile accidents, for it is not my intention to take up all of the accidents that an automobile might undergo.

An automobile's stomach is its carburetor. The carburetor is obliged to chew the food, if we may use this expression, mix it with the correct amount of air, or digest it, and pass it along to the engine in a digested condition. If the carburetor does not vaporize or chew its food completely, the engine acts sluggish or possibly does not run at all.

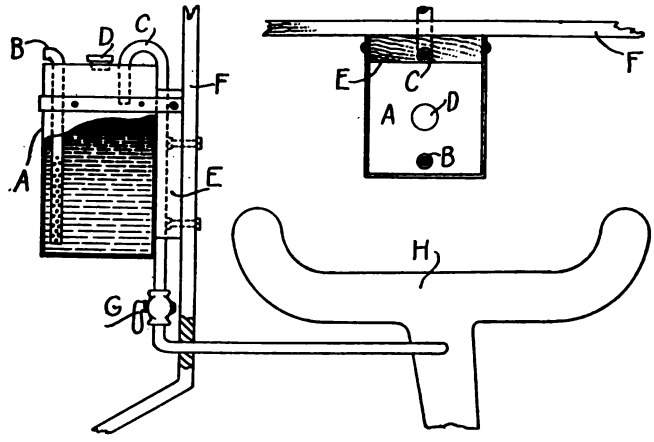
This trouble is noticeable particularly in the cold weather. The engine has a "stomach ache" and needs a hot-water bottle.

At the end of this month many motorists will be arming themselves with suitable medicines and paraphernalia to cure or prevent this disease which I call engine stomach trouble.

There is one medicine which can be carried in the tool kit very handily. Its action is immediate upon application. The medicine I speak of is ether. The dose ordinarily is about one spoonful. Divide this liquid into four portions and pour one portion into each priming cock. It is a predigested food and the engine usually starts off with a "bang," immediately.

Now ether for an automobile is like morphine for a person. Don't use it too much. Its effect may be lasting if it is used in quantities. Don't use it unless it is absolutely necessary.

A hot-water bag on its stomach often solves the problem. Let me tell you how to make a handy hot-water bag for it. Take a long stocking and fill it with sand, or make up a tube two inches in diameter and twelve inches long and fill this with sand. On a cold winter's morning put this bag in the oven or near the furnace and let the sand warm through thoroughly. Then when you get ready to start your machine, wrap the bag around its "neck." I mean around the intake manifold just above the carburetor. In about two min-



Digitized by Google

utes the manifold will be warmed through and the engine can be started very easily.

Luckily, an engine does not mind extremes of heat and cold like a human being. This being the case, you don't need to worry about whether the sand is too hot or not. You can use a horseshoe around the manifold or most any piece of iron will answer the purpose if it is heated through before it is put in place. When an engine's stomach is warmed it digests the food much more easily than when it is cold. Just remember that, or in fact, if you know anything about physiology or anatomy, when there is something the trouble with the engine, compare it with a person and see if you cannot think of the remedy.

A few paragraphs back I suggested that automobile illnesses may be divided into two classes, stomach and nervous troubles. Let us see just what I mean by these two divisions. If an engine stops or will not start at all, it is because it is not getting an ignition spark or because it is not getting the fuel. Suppose you are out in the country and the engine refuses to exert itself, or in other words, "goes on a strike." First look and see whether it is getting anything to eat or not. That is, be sure that there is fuel in the tank. Then see if the pipe line is clear between the tank and the carburetor.

It is an easy matter to find this out if the carburetor is fitted with a drain cock. All you need to do is to open

"A Medicine Feeder" for the Engine. A, Air Tight Tank; B, Inlet Tube; C, Tube to Manifold; D, Filler Vent; E, Bracket; F, Dashboard; G, Valve; H, Intake Manifold.

the drain cock and if gasoline flows from it, you can assume that there is gasoline in the carburetor. If, however, the carburetor is not fitted with a drain cock and there is no means for you to tell whether there is gasoline in it or not, try the following experiment:

Fill each pet cock with gasoline or if there are no pet cocks opening into the engine cylinders, remove the spark plugs and pour about half a teaspoonful into each cylinder. Close the pet cocks or replace the plugs, throw on the ignition switch and start the engine. If the engine runs a few explosions and then stops, the trouble is probably in its stomach.

It may be that the needle valve of the carburetor is stopped up, or it is very possible that there is dirt in some of the small gasoline passages in this device. Remove it from the car and clean it thoroughly. Before removing it, however, be sure that there is no trouble in the fuel line between the tank and the carburetor.

If after priming the engine still refuses to run, the trouble is probably in the ignition system. Some of its wires may be broken or some of the electrical units may be out of order.

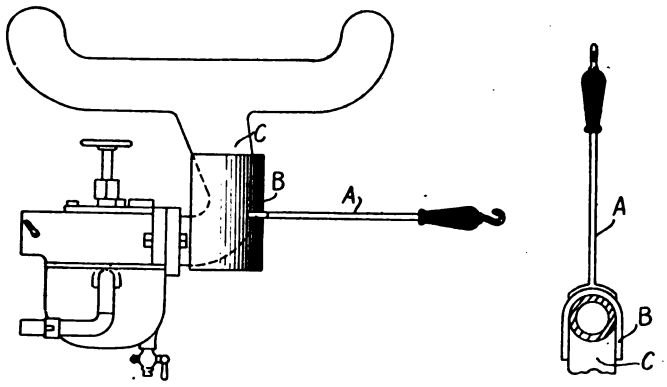
You know that if the main nerves leading into your hand were cut, you could not move your hand. To a certain extent, the same thing is true of the engine. If any one of the wires is cut or broken between the ignition system units and the magneto or battery, then the engine cannot be made to operate until the wire is repaired or replaced. There are two kinds of "nervous systems" installed on automobiles: single coil and multiple coil systems.

The single coil ignition systems are fitted with a device in the primary circuit called a breaker box and a device in the secondary circuit to distribute the current to the proper cylinder called a distributor. The multiple coil systems are provided with a coil for each cylinder and a device called a timer which automatically brings into action or completes the circuit for each coil in succession.

The coils are connected so that the timer will bring them into action in the firing order of the engine. Either type or coil system is easily tested.

If after priming the engine it cannot be started, remove all the spark plugs, leaving them connected with their respective wires. Put them on their sides against the cylinder head and crank the engine. A spark should appear at each plug in succession if the ignition system is in condition and should the spark not appear, then remove each secondary wire and while the engine is being cranked, hold it about one-quarter inch away from the metal of the engine. If the ignition system is in condition a spark will leap from the wire to the engine.

If a spark is not obtained at the plugs, while the engine is being cranked, the trouble is at some other point in the ignition system. In order to explain the method for finding ignition troubles, let us consider the various types of ignition systems.



The Single Coil System.

First, the single coil system which employs a battery for the source of current! Remove the distributor cover and examine the breaker contact points. Upon turning the engine over, these contact points should touch each other just as the pistons reach the top of their stroke shortly thereafter. If they do not touch, adjustment should be made so that they will touch at the proper point.

With the spark fully retarded the points should come together just as the piston has reached the top of its

Digitized by Google

stroke, in some cases; in other systems they are together at the top of the stroke, and separate after the piston has traveled one-eighth of an inch downward. In every case they should snap apart just as the piston has

A "Stomach Warmer." A, Handle; B, Iron Casting to Fit Manifold; C, Intake Manifold.

started on its down stroke. Adjust them so that when they are fully separated the clearance between them is approximately the thickness of a piece of paper or about .025 of an inch.

These contact points should be smooth and parallel with each other so that when they do come together, they touch across their full face. Turn the engine over until the contact points are together and remove one of the wires from the battery. Throw the ignition switch on and make a quick contact with the battery and the ignition wire which has been removed.

A spark should be had at this point. If not, indications are that the wiring is broken or disconnected between the battery and the coil or breaker box. It may be that the contacts are poor or that the wire is broken inside the insulation. Remedy this trouble.

There is one other possibility, however, and that is that the battery is not furnishing current. Take a short length of wire. Connect one end with one terminal of the storage battery and snap the other one across the other terminal quickly. Do not leave it connected as it will short-circuit the battery. The spark should be had when contact is made; if not, the battery should be replaced with a new one.

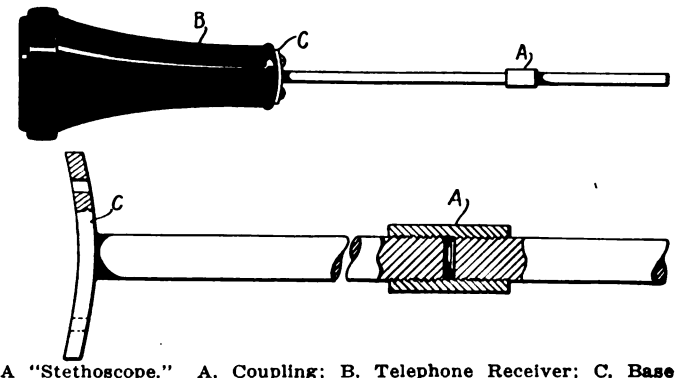
If in the first test a spark is had when the ignition wire is connected with the battery, put a piece of paper between the breaker points and try the experiment over again. In this test there should be no spark at the battery. If there is, it is an indication that there is a short-circuit in the line or one of the wires has been grounded. This short-circuited wire should be repaired or the break in the insulation covered to prevent grounding.

If it is found that the ignition system is all right from the coil to the breaker box, locate the secondary wire which leads from the coil to the center of the distributor. Remove this from the distributor and hold it about ⅛ of an inch away from the engine base.

Remove the piece of paper from between the breaker points and allow the points to come together. Snap them apart quickly and you should obtain a spark between the secondary terminal and the engine. If not, there is evidently trouble in the coil itself. Either repair this trouble or obtain a new ignition coil. If a spark is had, there is evidently trouble in the distributor. Clean this unit thoroughly with a cloth moistened with lubricating oil and wipe it dry.

See that the distributor brush functions properly and that all of the secondary wires are properly connected. After having made sure of this, make the first test again, when a spark should be obtained at all of the secondary terminals. If not, then the indications are that there is trouble in the plugs themselves.

Remove the porcelain and clean the plug with kerosene oil. Examine the porcelain for small holes or cracks.



Multiple Coil Ignition.

If the system is of the multiple coil type, test the battery to make sure that it is furnishing current. Remove each wire in succession from the timer and touch it to the engine base. If any one of the coils does not vibrate, adjust the vibrator. If no current seems to pass through the coil, trace the wiring from the coil to the battery and also from the coil to the timer. Remove each of the coils that does not function from the battery box and see that the spring contacts touch the coils properly.

Make a secondary wire test as directed in instructions for single coil systems.

Magneto Systems.

There are two types of magneto systems, low and high tension. The low tension magneto systems are divided into two classes. Magnetos of the ordinary magnet type driven through gearing or by belts from the engine, and the Ford magneto. The latter is different from any of those and perhaps the easiest tested of all. Remove all of the spark plugs so that the engine may be turned

A "Stethoscope." A, Coupling; B, Telephone Receiver; C, Base of Rod.

rapidly. Disconnect the wire leading from the magneto terminal to the coil box at the coil box terminal. While the engine is being turned over, touch this wire to the engine base. A spark should be noticed, and if not, there is trouble in the magneto. Remove the plug at the

Digitized by Google

top of the magneto and clean it with a piece of waste and sandpaper. You will note that this plug is fitted with a point and a spring. The point rests upon the magneto terminal plate inside the housing. Clean this plate by means of a screwdriver or a chisel and replace the plug.

Be sure that the spring is drawn out enough so that it forces the point down upon the magneto terminal plate. Try the first test again and see if the spark can be had from the brush wire to the engine base. If not, it is best to have the magneto repaired by an expert.

There is little that can be done with the second type of magneto. If the magneto is of the low tension type and a coil is used, make the same tests as you made with the single coil system. In any type of magneto always examine the breaker box first. Be sure that the contacts are clean and that the points come together across their full surface, and that they separate approximately 1/50 of an inch when the breaker arm is riding upon the cam.

Distributor boxes of magnetos require the same attention as a distributor box of any coil system. If the above procedure is carefully followed, one will have no trouble in finding out the reason for ignition line failures, and though one cannot always remedy the trouble one's self, it can usually be located.

Cleanliness is essential. Always remember that the secondary current, that is, the current which supplies the spark plugs, is of very high voltage and that it will travel across any oil or water-soaked surface. All contacts in the primary circuit must be cleaned and tight. Remember that a primary wire may break inside the insulation and the break go unnoticed. In testing out the primary system, replace each wire in turn by one which is known to be good.

If you find that the engine will run, but will not run on all four cylinders, but you cannot locate which of the cylinders is missing, short-circuit each plug in succession. You can do this with a screwdriver. Touch the end of the screwdriver to the cylinder head and bring the metal part of the screwdriver against the top of the plug. Note the action of the engine when this is being done.

If the action changes, you can well assume that the particular plug which is being short-circuited functions properly when the screwdriver is removed. One cannot always locate a missing cylinder by short-circuiting one plug, and if such is the case, short-circuit two of the plugs at one time. In this way, one can eliminate various sets of cylinders until the cylinder is found which is missing fire.

Spark plugs usually fail from either of two cases. Either the electrodes are separated too far or the insulation is broken down. The distance between the electrodes on a coil system should be approximately 1/16 of an inch or slightly less, while the distance between the electrodes on a magneto system should be between 1/32 and 1/16 of an inch.

Bear in mind that a spark may leap across this space when the plug is removed from the cylinders, but may not have strength enough to jump across when the plug is in place and subjugated to high compression. Examine the porcelain very carefully for breaks or holes.

A Stomach Pump.

I have spoken of feeding an engine with medicine and herewith is illustrated a device which most any automobile owner can make and use for feeding his engine with any sort of liquid, either for removing carbon or for starting it in cold weather.

Obtain a tin can such as is used for containing chocolate or cocoa, which is fitted with a tight fitting top, and in it punch three holes. Fit one of them with a short length of tubing which is punched through with a number of holes at its end and solder this tubing into place so that it extends nearly to the bottom of the tank. Provide the second opening with a tight-fitting screw cover, while the third opening should be provided with a long tube which leads to the intake manifold. This tube should be provided also with some sort of a shut-off arrangement such as a pet cock. This second tube should not extend into the tank, but be soldered to the cover only. The whole device should be made air-tight.

If it is filled with water to within about one inch from the top and the engine started when the pet cock is open, moist air is drawn into the manifold and the engine action improved. Water if used in small quantities has a tendency to drive off carbon and often increases the power of the engine. Kerosene oil or carbon remover may also be placed into this feeding arrangement to great advantage.

If your automobile has stomach trouble, one of the first indications is extreme carbonization. If you are feeding it too heavily the carbon will stay in the cylinders and cause lack of power. The engine will protest against overfeeding and voice its anger by emitting a sharp knock after it has been heated. This knock is caused by preignition and the overheating of the carbon on the piston head.

Knocks can usually be located by means of what I will term a stethascope made from an old telephone receiver and a number of lengths of steel wire fitted together by couplings. A drawing of this device is shown herewith.

Take a day off whenever you can and do something for the Red Cross, the Y. M. C. A. or the latest Liberty Loan.

Let customers lose their heads. If you keep yours you still have a chance to part with them on friendly terms.

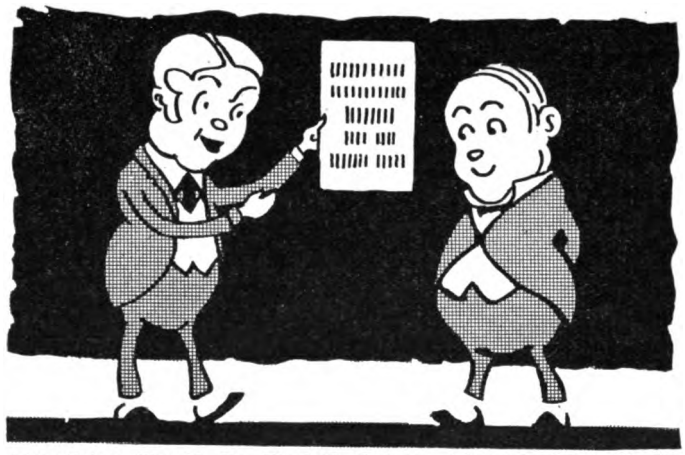
How To Place and Distribute Advertising So That It Will Give Results



5—Prepare Your Advertisements Ahead of Time and Do Not Try To Use Long Headlines or Say Too Much in the Reading Matter

BY FRANK FARRINGTON
Illustrated by JATT

I HAVE already said considerable about making up the advertisement, but I want to begin back a little farther and take up the preparation of the "copy" or original draft of the advertisement as it goes to the printer.

Having decided what to advertise and where to advertise it, get ready to write the advertisement. Don't wait until it is time to take the copy to the printer. Do it ahead of time or else you will be hurried and make a poor job of it.

In order to have a carefully prepared advertisement for each issue of the paper, you ought to have several blocked out in advance and perhaps completed all the time. Last minute advertisements, like deathbed repentances, don't amount to much.

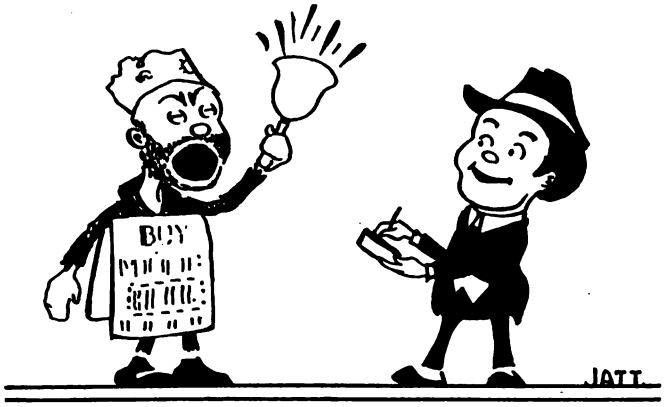
Advertising Should Be Blocked Out in Advance; Last Minute Advertisements, Like Death-Bed Repentances, Are Too Late.

You will find it difficult to write a good advertisement if you do it in a hurry unless you are experienced in the work. You will not get your money's worth out of your space if you put into it, hurriedly written matter which does not say what you want to say or in the best way.

The more inexperienced you are in advertisement writing, the more time you will have to give to the work, of course, but don't slight it. When you are new at it you will have to write your advertising over several times. You can always improve an ad by rewriting it. You will probably never get one so good that rewriting would not better it. That is true with the best ad writers. The trouble with the experienced hands making their ads in that way practically perfect is that they will not take the trouble to rewrite.

If you let the idea get into your head that you cannot spare the time to make up your advertising copy, you will fall down on the work. It must be given proper time or you will not get value received for the cost of the space you use.

In order to know more about newspaper advertising it will be a mighty good thing for you to study other newspaper advertisements, those of your competitors of course, to know what they are doing, and those of other advertisers to know what a good advertisement is. When an advertisement of something you are yourself thinking of buying appeals to you and makes you consider purchasing, stop and investigate the reason why it appeals to you. See whether you can make use of the same idea in your ad.



For example, you may see an overall advertisement that is headed, "Does It Irritate You?" Since sometimes you do become irritated, you stop and read the advertisement of overalls easy to slip on and easy to take off, the kind that do not irritate you by sticking, by tearing, by losing buttons or by some other imperfection.

That appeals to you as a catchy headline and you try to make use of it in your ad. You change it to "Don't Get Irritated!" and go on to say, "If your car doesn't give you the gasoline mileage you think it ought to give, don't allow the fact to wear on your nerves or on your pocketbook. Bring the car around and let our carburetor man take a look at it. Just a little twist of an adjustment may mean a couple of miles more to the gallon."

You may not want to copy ideas and sentences from advertisements in your home papers, but you may feel perfectly at liberty to copy whole advertisements of garages as you find them in the newspapers from another town. Wherever you find a good advertising idea, grab it. Keep a scrap book and put into it all the good ads you can clip. Or take a letter file box and put into it clipped advertisements properly classified. Instead of

Digitized by Google

the alphabetical arrangement of the guide leaves, put on each one a subject, such as Repairs, Gasoline, Oils, Greases, Batteries, etc. Then keep clipped ads under these heads. When you want to advertise batteries, you

Jot Down in Your Vest Pocket Memo Any Good Ideas That Come To You About Advertisements.

know where to turn for sample ads. File all your own advertisements too for future reference and for repetition later if occasion demands.

Ideas are of the greatest value and you cannot always call them up in your mind when you want them, so file them. Don't be afraid to use the ideas of other men. You will find advertising ideas in your trade papers. Clip these out and file them too.

If you have a typewriter, your advertising copy will be much more welcome to the printer and he will be less likely to make mistakes in setting it up. If you write by hand, make your writing plain and see that there is no chance for a misquotation of prices. You can ask the printer to let you see a proof of your advertisement any time. It will be well, always, to keep a carbon copy of the advertisement as you send it to the printer. Then in case of an error it will be possible to place the blame.

While it may not be practical to see proofs of your newspaper advertisements only in exceptional instances, you will want to see proofs of any other advertising and you ought to learn how to indicate corrections in the proof. There are various little handbooks published which can be bought for 50 cents or a dollar, explaining about proofreading and proofreader's marks. It will pay you to get such a book. Ask your printer for a sam-

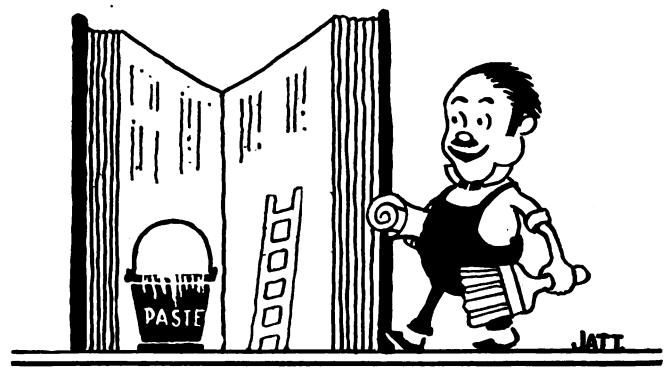
When You Are New at the Game You May Have to Rewrite Your Advertisements Several Times.

ple sheet of corrected proofs or go to the public library and get the information if you don't want to buy a handbook.

One of the first things you will learn about type matter is that the capital letters are referred to as "caps" and the small letters as "lower case." The latter term is due to the fact that where type is set by hand, as you have seen it set from cases by a printer on a high stool, there are two cases, the upper of which contains capitals and the lower small letters.

If you want a heading set in capitals, you will indicate "Caps," and if partly small letters, you will indicate "Caps and lower case" or "upper and lower" or the printer will understand "C. & l. c."

Any instructions you put on your copy, instructions to the printer, or instructions written on a proof sheet, should be put on with a red or blue pencil to show that they are distinctly not a part of the copy.



Capitals Are Harder To Read.

In regard to the use of capital letters, the inexperienced ad writer has the impression that the way to emphasize a line or word is to print it in capitals. Capitals are bigger, but they are harder to read. Take the following two lines, for instance, and note the difference in the ease of reading. The lower case matter is much easier to read:

THE BEST TIRES TO BUY ARE CORD TIRES

The best tires to buy are cord tires.

A headline set all in caps may be bigger than one in caps and lower case, but it is harder to read. If you

Keep a Big Scrap Book and Put Into It All the Good Ads You Can Find.

want to make it stand out more conspicuously, either use a larger size of type, or else a blacker face type.

In making up your headlines, don't make them too long. Four words of medium length make a line as long as the eye will take in without effort. You know how it is when you see three or four birds on a fence or three or four ducks in a pond. You don't have to stop and count them. You know there are four as soon as you glance that way. In the same way you don't have to stop to read:

Up Go Tire Prices!

You see at a glance what it says. You do not have to move your eyes along the page as you do in reading across a line of more words. Four words of average length are as many as the average eye can take in without moving. No doubt many people would not go beyond

Digitized by Google

three without effort. Some might even hesitate at the third.

The moral of this is that if you want your headings to be taken in at a glance, make them four words or less, and set them in caps and lower case. Make it so easy that "He who runs may read."

The heading should not only be short. It should give an idea of what the advertisement is about. Any reader would recognize what the advertisement was about if headed, "Up go tire prices!" If it were headed, "With prices going up," there might be a good deal of doubt,

If You Use a Typewriter, Your Advertising Copy Will Be More Favorably Received.

and the man interested in tires would not be led to read on that account.

A form of advertising that always makes a hit if handled properly is that written in the first person. Many advertisers here and there throughout the country have indulged in the use of the first personal pronoun in their advertising and have made it pay. You may have the faculty of doing so.

When you talk in your advertising about yourself as "I" instead of "We," your readers visualize you. They think of you as a person, and if they know you, they picture you in their minds. "I" means something while the customary editorial "We" means very little. It simply stands for a business organization.

"This is the very best bargain in the second-hand car I ever had in my garage" gets over as it would not if it read "We" instead of "I."

"I" brings about a point of contact right away between the reader and the dealer. It helps to capitalize the dealer's personality. People remember how he has treated them and they recall his pleasant manner and his personal interest in their automobile troubles.

Where a garage is operated by a firm of two men, the personal factor can be developed by letting one of the men, ostensibly, at least, write the advertising. He can refer to himself as "I" and to his partner as "Tom," if that is his name. "Tom and I have decided not to raise tire prices until we sell out the stock we have on hand, bought before the raise."

Write all advertising carefully. Go over it thoughtfully and eliminate the words that are not needed. Cut out the sentences that add nothing to the information contained or to the appeal made. Tell only what the customer wants to know.

Then practice. Write an advertisement every day. Think over advertisement you may write. Jot down in your vest pocket memorandum any ideas that come to you for good headlines or for good sentences to use in ads.

You know your business and you know what your people want. You ought to be able to write better advertising for yourself than anyone can write for you.

SAVE YOUR TIRES.

Pay Particular Attention to the Small Cuts and Pin Holes That Sooner or Later Will Make the Tire Useless.

IF you should tear a hole in your jacket, you would probably take it to the tailor's very shortly to have it mended, not only because a ragged coat gives one a poor appearance, but because of the fact that the little tear would soon grow into a big one. Yet, do you pay as much attention to your automobile tires when they are cut or torn? I will venture to say that you do not. You run your tires over sharp rocks and glass without thinking of the consequences. At night when you drive your car into the garage you lock the doors and don't even give it the attention that you would a horse. There are a number of things that you should do every night before you leave the car, but I will only dwell upon the question of tire repairs at the present time.

It is of course impossible for one to drive his car only upon smooth ground or pavement. There will be times when tires must be driven over poor roads, and necessarily there is considerable wear on the treads.

Every little cut in the tire means a larger one shortly, unless it is attended to. Suppose you drive a tire over a piece of glass and cut through the tread a distance of one-quarter of an inch. The tire travels through a muddy place in the road and this little hole acts just like a suction disc. It picks up water and mud from the puddle and at the next revolution of the wheel acts just like a strong force pump. The mud and water are forced between the tread and the fabric.

After a short distance the cut grows to one-half of an inch in length and the tread is separated for a space of one-half an inch all around the cut from the fabric. A blister ensues, or else tread separation continues until the whole section of the shoe has been ruined. Water is not such a great enemy of rubber as is oil. The latter eats into rubber and softens it just the same as acid eats into rock. This is particularly true of the oil used upon roads, so that if you should drive a cut tire over an oiled road, the oil would work into the cut and shortly destroy the fabric as well as the tread.

Before leaving the car for the night always make a point to wipe off the road oil from the tires. Be sure that the tires do not stand in a pool of oil. If oil leaks from the transmission or engine, place a catch basin beneath the leak to prevent the oil from reaching the tires.

Digitized by Google

Make a periodic examination of all the tires, inspecting them for small pinholes or cuts, and you will find that this procedure saves you much money.

All little cuts in the shoe should be carefully filled with a rubber cement and a paste-like mixture of soft, crude rubber and cement. If the cut is smooth it should be carefully cleaned with gasoline and a soft cloth or cotton waste, then the filling compound inserted. If the cut, on the other hand, is jagged and uneven with little pieces of rough rubber around it, the jagged edges should be pared off with a sharp knife before the filling compound is inserted.

Cleanliness in repairing tires is essential. Rubber cement will not adhere if the place to be patched contains dirt or grease. Do not expect a patch to hold if you apply it while your hands are covered with grease and oil, nor expect the filling compound to remain in the cut if the surfaces are covered with dirt and grease. Don't expect the tire to give satisfaction if you patch only the surface and leave the sand and water in a bubble between the tread and the fabric. Sooner or later the fabric will be broken down and a blow-out will result.

Anticipate blow-outs, and this is important. There is no reason why one should allow a shoe to be driven until the fabric gives way. If you know that there is a weak place in the tire you should insert some sort of a liner between the tube and the shoe to strengthen the tire. A blow-out often means a new tube.

Here is an interesting way for making liners, that not every automobile owner knows about. Take an old shoe which has passed its days of usefulness and with a sharp knife remove both beads, or if the tire is of the straight side type remove the retaining walls and cables at the sides.

Cut the tire across, into sections from ten inches to eighteen inches in length, depending on the condition of the tire as regards strength of the fabric. With a sharp knife separate the tread and breaker strip from the fabric at one end and clamp this end of the fabric into a vise. With the exertion of a little strength the tread may be torn from the fabric.

I know of no better liner than the strong piece of fabric taken from an old tire. The inside of the fabric has been smoothed by contact with the tubes, while the outside has just enough rubber in it to permit it to adhere to the inside of the shoe in which it is applied.

Among Mississippi Garages

Some of the Tools and Methods of Repair Adopted At Ford Service Stations Down in the Sunny South

BY JAMES F. HOBART, M. E.

THERE are some pretty "slick" garages to be found in the Northern States, but not *all* of the good repair and service shops are there, not by a good deal. The South has her large and increasing share, and I have seen some repair shops in the South which will make the North "go some" to equal! In Vicksburg, on a clay bluff 200 feet or more (rather more by the time I climbed up there) is a large brick building devoted entirely to the sale, service and repair of Ford cars.

Indeed, the sign upon the front of the building which bears the firm name of "The Powell Motor Company," also bears the legend, "Authorized Distributors of Ford Cars." The first or street floor of the large building, which is nearly square, is occupied by the office, show room and service department, the latter being in the rear, with entrance from the front at the end of the building farther from the office. There is also a rear entrance from the alley.

The second story is devoted entirely to shop purposes, a commodious platform elevator being located directly in front of the passage which leads from the front to the service room. Immediately adjacent to the elevator, upstairs, is located the "rear end" overhauling station, which contains the very convenient fixed trestle shown by Fig. 1.

This trestle is evidently "home-made," though I was unable to learn who was the designer and builder of it, the shop foreman stating that the trestle "was there when he came, and it would be there when he left, for it was a mighty good and convenient tool." The trestle was built of 1¼-inch steam pipe, the regulation fittings being used same as are employed for railings and machine guards in which pipe is used. The floor flanges were of the regulation stock pattern, and were fastened to the floor by four screws to each flange.

The flat bearing, A, had been bent up from a piece of ½ x 2 inch black steel and it was evidently oxy-acetylene welded to a pipe coupling. The semi-circular bearings, B, C and D, were simply tees, the top half of which had been hack-sawed off. These were of different sizes, the one at C being the larger of the three.

Rear-End Trucks.

In connection with this trestle small lever trucks were used for handling "rear ends." These little trucks being so made that, bearing a rear end upon them, a truck could be pushed right under the blocked-up car, and by pulling a couple of levers at the rear of the truck the "front end of the rear end" would be elevated just right to slip into its place. Fastened there the back of the "rear end" would be raised into place and the truck

Digitized by Google

withdrawn, thus making very easy the matter of putting "rear ends" into place, and, working contrariwise, in removing them from the vehicles.

A Demonstration Magneto.

Upon a bench, close to the elevator, I noticed a Ford magneto mounted upon a shaft to which a crank had been attached so the magneto could be operated by hand-power and so the customer could familiarize himself thoroughly with the magneto and the manner of its working. In the other end of the repair shop was located a machine to which a magneto could be readily attached and power driven as found necessary. This machine was also used for "grinding in" crank shafts and bearings, of which more in a later paragraph.

The Power and Machine Equipment.

All the power machines in this shop were driven by a 10 H. P. electric motor which had been installed upon a bracket about six feet above the shop floor. The motor was large for the purpose of operating the "grinding-in" machine mentioned above. A single shaft, 1 7/16 inches in diameter and about 12 feet long, drove all the shop machinery, which consists of the "grinding-in" machine, a fine radial drill, a double-wheel grinding machine and an air-cooled air compressor, which worked into a receiver, made of boiler steel, and so large that the ordinary shop use of the several machines always kept plenty of air pumped up without ever having to run the motor for driving the compressor alone.

The air compressor was located upon a little shelf right in a corner where the side wall and rear wall of the shop joined. The compressor was placed high enough to be above the head of the tallest man who ever came into the shop. Thus, the motor and the compressor took no floor room whatever. The "grinding-in" machine, the radial drill and the two-wheel grinding machine stood in a row, backed against the side wall of the shop, almost entirely out of the way.

Fine Light Arrangement.

The grinding machine was placed next to the rear of the shop, just where the light from a large window fell full upon the wheel and upon whatever work was being done upon the wheel. The light came sidewise, enabling the workman to see just what he was doing. This manner of lighting a grinding wheel is far better than placing the machine directly in front of a window with the machine shaft parallel with it.

In such a case the workman must either face the light and be troubled by the glare and reflections, or, what is worse, he must stand with his back squarely toward the light and with his body between the light and the work. There is only one worse grinding wheel location than this, and that is—and is only too often found—where the grinding wheel has been tucked away under a flight of stairs so as to be "out of the way" (of light?).

The side light which came to this grinding machine was the best that could be given, and it surely was a comfort to work upon that machine, where a man could see exactly what he was doing, either while grinding a twist drill or when roughing the corners off of a rough casting. The radial drill, standing beside the grinding machine, also received side light—and plenty of it—thereby making accurate drilling a pleasure as well as a sure thing.

The "Grinding-In" Machine.

Right at the head of the stairs, four feet from the side wall of the shop, stood the "grinding-in" machine, by the use of which all new crank-shafts and bearings were fitted into their engine castings. This machine was a "store" affair, made for Ford use exclusively, but not by Ford, and sent out to all authorized repair shops as a part of the regular equipment.

Briefly stated, this machine consists of a cast iron base, carrying at one end a post, through which passes

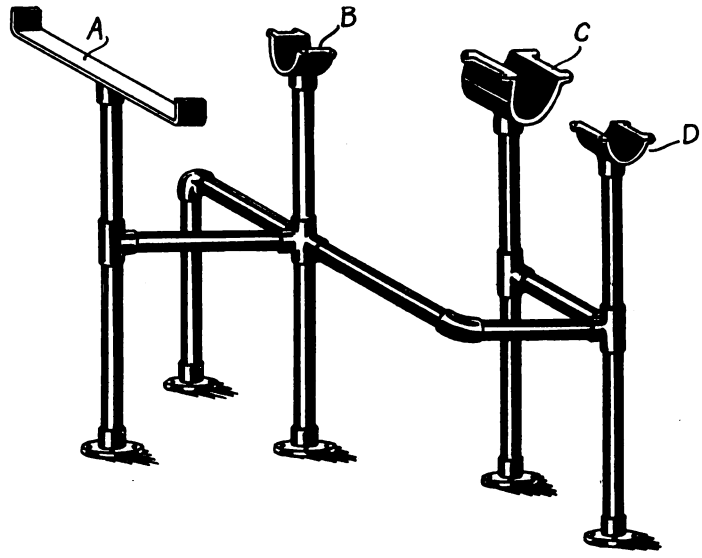


Fig. 1.—A Convenient "Rear-End" Ford Overhauling Trestle.

a shaft, terminating at one end in a universal coupling to which may be attached the crank-shaft to be "ground in." The other end of the shaft carries a fitting to which may be attached a Ford magneto, as described in a preceding paragraph.

The base of the grinding-in machine is fitted to receive a Ford engine case, with the cylinder head removed but with the shaft in place, the latter being bolted to the universal coupling mentioned above. The shaft carries between its two bearings in the post or column a pulley wide enough for an eight-inch belt, and the time required to grind in a crank-shaft is limited only by the power which can be applied through the belt in question

Method of "Grinding In" a Shaft.

About two hours' time is usually required for fitting a new shaft to its bearings, or for fitting new bearings to an old shaft. Nothing but oil is used during the process. The crank-shaft is rough-fitted to its bearings,

Digitized by Google

the caps screwed down upon each bearing as firmly as possible and so as to permit the shaft to revolve under the 8-inch belt power.

Then the machine is started and watched pretty closely to see that no bearing gets too hot. Oil is plentifully supplied and the caps tightened as fast as possible without causing undue heating. Usually, in about two hours, the shaft or its bearings will be found to have been "ground in" satisfactorily and the engine may be removed from the machine and placed directly in the automobile to which it belongs.

By this method of "grinding in," no cleaning of shaft or of bearings is necessary after the process has been finished. There is no abrading material to be cleaned out of bearings, and, of course, there is none to be left *in* bearings through careless or improper methods of cleaning. As only oil was used during the grinding-in process, the engine is at once ready for its car without further work. This is a big thing when fitting a new shaft or new bearing.

Only a Short Shaft Necessary.

Owing to the well-planned and very compact manner in which the several machines were arranged in this shop, only a very short length of shaft was required, using little power in friction and yet making plenty of room between adjacent machines. The motor was connected between the radial drill and the grinding-in machine and, standing upon a wall bracket as previously stated, required no floor room.

The power was thus divided upon each side of the shaft which received the motor belt, thereby making necessary a smaller shaft than if all the machines were connected upon the same side of the motor. The bearings were placed on the shaft very near to the motor pulley and to the pulley which drove the grinding-in machine, and this also permitted a minimum diameter of shaft. In fact, the very simple installation of power in this shop demonstrated what could be accomplished by careful planning before any installing was done—something which should always be the rule when shop shafting and machines are to be set up.

Adjusting a Wheel Bearing.

Recently I watched a good workman put a new ball bearing into an automobile wheel, and the manner in which he worked seems well worth telling about. First, he filled the large bearing with heavy grease and carefully placed the eleven steel balls in position, the grease holding the balls in place and preventing them from falling out.

The workman then put the wheel in place, screwed on the cone, and adjusted it as correctly as possible. Seemingly it was quite correct. Then he put on the "tongue-washer" and screwed the nut home. Upon turning the wheel it was found to bind, whereupon the workman loosened the nut and backed up the cone a bit with a punch. He found that it still was too tight.

Then he took off the nut and removed the tongue washer, which he found did not hold but went around with the nut. It had been battered by some careless workman and had gotten so far out of shape that the tongue did not prevent the washer from turning around with the nut. The workman then placed the washer on an anvil and hammered the tongue, stretching it, after which he filed off all hammer marks and left the washer smooth.

The nut and washer were then replaced and found to hold, the tongue preventing the washer from turning around under pressure from the nut. This left the cone adjustment as it was made and the wheel was found to run easily but without any appreciable lost motion.

Putting In a Knuckle Pin.

One thing which this workman did was not the best practice, according to the writer's way of thinking. After the wheel had been put in place the knuckle pin was driven home. Seems as though this should have been done first, for it is very much easier done then than after the wheel is in place and you have to work through or behind the wheel to get at the pin!

Another point in his work which did not look good. When the castle nuts were put in place and the cotter pins brought out, he could not tell where the pin holes were and had to loosen the nuts in order to find the pin holes. In several cases the workman had to remove the castle nut again, and clean out the pin hole before he could tell its direction, grease and dirt having completely closed the hole in one of the pins.

When screwing castle nuts home it is always advisable to first carefully note the direction of the pin hole and to see that said hole is clean and free from all obstructions. Then the nut may be tightened right down, once for all, until the pin hole comes fair with one of the openings, and there never will be any doubt as to the location of the hole or its direction and you can "Fire when you are ready, Gridley," in the matter of inserting the cotter pins.

And there seems to be just about one correct way of inserting cotter pins after doing a setting-up job. But many workmen do not seem to use the proper way! Perhaps they have not realized it? The way in question is this: Do not put in a cotter pin here and there as you set up the nuts, but wait until all the castle nuts have been screwed home, leaving the pin holes exposed as above, then go over the work and put in the cotter pins, one after the other. In this way no cotter pin will be forgotten. They will *all* be put in place.

By placing cotter pins as above there is very little danger of omitting any pin, therefore there will be no unpinned nuts to get loose and come off; also the matter of placing the pins is done in far less time than when they are placed, one at a time, in a haphazard manner. Therefore, put on all the castle nuts, then give the "once-over" with the cotter pins, and the car will be surely pinned up in fine fashion, with not a pin forgotten or left out.

Dieting the Carburetor

If You Want To Make a Record for High Gasoline Mileage You Must Know How To Adjust the Carburetor on Your Car

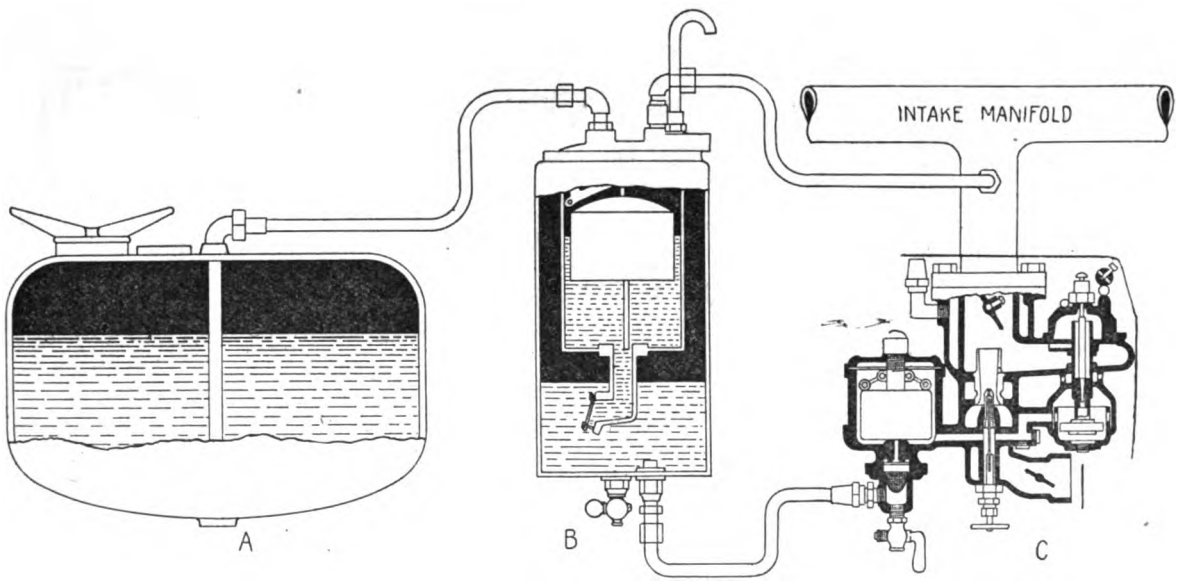
BY J. FRED GILMAN

EVERY so often we see accounts in the trade magazines and press of motorists that average thirty-five to forty and in some cases as high as fifty miles per gallon of gasoline. One always reads these articles and immediately becomes skeptical in his comments, because he does not understand just how it is done. It can be stated with authority that if he would take the trouble to look up some of these people or write them, he would find that such mileage is possible and can be had by care in driving and the proper attention to the engine of his car. He would also learn that a high average of mileage per gallon of gasoline is achieved through keeping the carburetor properly adjusted.

Carburetor First to Suffer.

Invariably, whenever the car develops the characteristics of a mule, the first object of attack by the driver is the carburetor. If the trouble is elsewhere, poor old carburetor has to worry along with its new adjustments be they good, bad or otherwise.

How many times have you been out in the country, riding easily along enjoying the beauties of nature, and when coming to a long hill you feel that the opportunity to "open her up a bit" is too good to be lost? You do so; everything is fine; the speedometer hand is slowly creeping towards its limit; you are about to skim over the crest of the hill, when to your disgust you hear a muffled "pop, pop" under the hood. The carburetor starts spitting like a frightened cat and the car immediately slows down, losing its power.



Sore? Certainly you are; but a loss of temper means that your energy is automatically switched to a useless flow of cuss words, and that won't fix your car.

Locating carburetor trouble is not necessarily keen detective work, but the method of "Look, Listen and Think" should be universally adopted by motorists. Of course, carburetor ills are very confusing because they are so much alike, but each trouble has a certain combination of symptoms that indicate that particular trouble.

Practically all carburetors have the same adjustments and will come under the following:

Turn the needle valve (if there is one) to the left one and a half turns and shut off any auxiliary air intakes or economizers or high speed nozzles, etc., in fact any other gasoline or air intakes except the low speed nozzle and primary air inlet. Prime and start the engine.

If the needle valve is open enough the engine will run on the primary gasoline and the air supplies—if too little gasoline the engine will back-fire or stop. Adjust the needle valve accordingly until the engine runs on primary air and the gasoline flows smoothly. Then advance the spark and give the engine more air through the auxiliary air valve (if there is one) until it backfires; then cut off the air until smooth action is obtained.

A Typical Fuel Feed System. A, Gasoline Tank; B, Vacuum Tank; C, Carburetor.

High Speed Adjustment.

You now have the following condition. A correct mixture of air at low speeds with plenty of gasoline; an auxiliary air valve which is ready to open as the engine

Digitized by Google

speeds up—but does not open too freely; and closed high speed nozzles (if any) as well as closed economizer air inlets. And an engine running smoothly under these conditions.

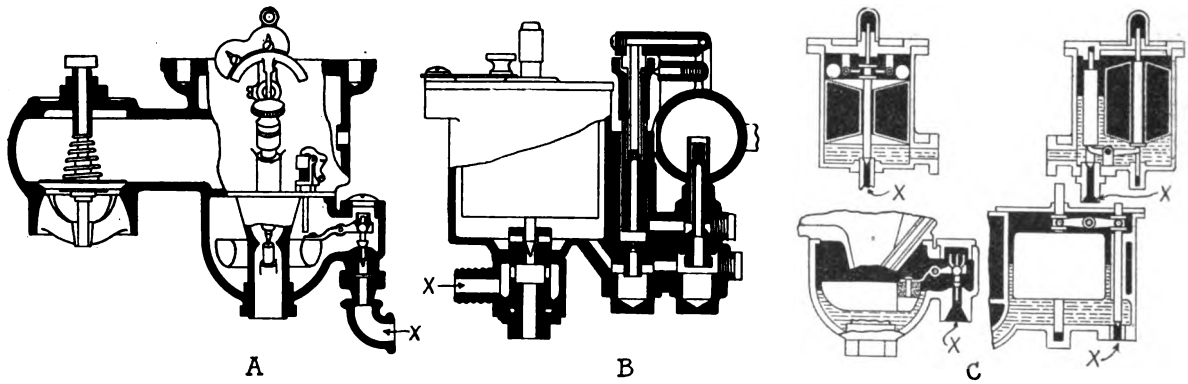
Now open the throttle and accelerate quickly. If the auxiliary air inlet is too loosely adjusted, too much air will be admitted under the additional suction and the engine will back-fire. The auxiliary air valve spring must be tightened until acceleration takes place smoothly and easily. If there is a high speed gasoline spray nozzle, instead of tightening the auxiliary air spring open the high speed gasoline valve slightly until smooth acceleration is accomplished. The economizer air inlets (if any) are to be adjusted last with the engine fully heated and while the car is being run on the road.

The above directions will cover all makes of carburetors except the Schebler, which is fitted with another adjustment; the throttle-gasoline-needle valve arrangement. As the throttle is opened the needle valve is lifted and adjustment is had through two dials above the needle valve. With the engine throttled down the dial above the needle valve must be adjusted for idling and is taken care of as is the needle valve itself. As the engine is speeded up, the second dial is adjusted in the same way as is an auxiliary gasoline needle valve.

Use Your Nose.

In locating mixture troubles the most important point is to observe the exhaust, if it has a bad odor, or if the muffler emits dense clouds of smoke, generally black. This is a sure sign that the mixture is too rich and contains too much gasoline in proportion to the air.

This condition should be carefully watched in the small unventilated garage, for death has resulted in numerous instances from inhaling these fumes. Blue gray smoke coming from the exhaust should not be confused with black smoke, as this color smoke denotes excessive lubrication.



Note the flow of fuel from the tank to the carburetor. If it is of the simple gravity feed type, it sometimes happens that dirt collects in the filter to such an extent as to prevent a free flow of gasoline. In many cases a fine wire gauze is interposed between the float chamber and the tank to prevent the passage of dirt, sediment, or foreign matter which may be held in suspension by the fuel. This gauze may have become choked or perhaps the pipe itself has become obstructed, especially at an elbow, by particles of lint. The drive should be tested to make sure that it is unobstructed and that the gasoline stream is the full size of the orifice.

Particles of dirt may lodge between the float control valve and its seat, either constricting the opening and preventing a proper supply of fuel, or causing the valve to remain open and allowing too much gasoline to feed through. Another cause of failure is defective operation of the float.

Two Kinds of Floats.

Floats are made in two forms, either of cork or of light, hollow sheet metal. If the float is of cork it perhaps has become soaked with gasoline, which will cause the level of gasoline in the float chamber to rise too high. A metal float is liable to fill with gasoline through a minute leak and become too heavy.

A cork float should be removed and dried or baked, after which it should be thoroughly shellacked to prevent it from again becoming soaked.

A and B, Two Types of Carburetors. C, Four Types of Float Valves; X, Indicates Gasoline Passage.

The leak in a copper float is often hard to locate on account of its minute size, and it should be immersed in very hot water, as in this way the gasoline will be vaporized sufficiently to force its way out through the puncture and the spot can then be located easily by watching the bubbles. The float must of course be removed from the water the instant that bubbles cease appearing. It should then be soldered, using the least amount of solder possible to prevent it from becoming unnecessarily heavy, thus impairing its efficiency.

On most makes of carburetors there is an adjustment provided directly above the gasoline float needle valve for regulating the height of the float. If not (for instance as on the Schebler) the float arm can be bent up or down, as this will regulate the height of the float and at the same time govern the float needle valve.

On many carburetors there is a provision for hot water or hot air connections. In a great many instances these are taken off, or not put on at all. They are very essential, as the more heat introduced into the mixing

Digitized by Google

chamber of the carburetor, the greater will be the increase in mileage and power.

The carburetor should be adjusted for a mixture rare enough so that the dash control must be pulled out until the engine is thoroughly warmed up, then pushed down to running position. This method will always insure maximum mileage with a minimum consumption of gasoline.

Use Your Brains.

Note the aforementioned facts carefully before you change your carburetor. The car owner who will take a ten-minute lesson at his service station and obey his instruction book will find that it not only makes it easier to do this work himself instead of stopping at a garage, but will also keep his engine running smoother and more quietly, and at the same time reduce carbon deposits and increase gasoline mileage.

In proof of how easily a half gallon of gasoline, costing fourteen cents, may be wasted in operating a car only a simple calculation is necessary. One half-gallon represents about seven miles of travel under the average road conditions. Cars which are heavy probably do not get this mileage on a gallon. When the car is stopped and the engine idling at 250 revolutions, about every two hours a half gallon of gasoline is wasted. Here is the necessity for proper carburetor adjustment.

There is a difference of about seven miles in the distance that can be covered with a gallon of gasoline with the carburetor in good adjustment as compared with poor adjustment. Assume that a car is driven fifty miles a day with an improper adjustment, there has been consumed four gallons at the rate of twelve and a half miles to the gallon, or if the carburetor had been properly adjusted the distance would have been covered in two and a half gallons.

An Economic Code for Gasoline.

Have the carburetor adjusted to utilize the leanest mixture possible. A lean mixture minimizes carbon deposits.

Stop all gasoline leakage. Form the habit of shutting off the gas at the tank or feed pipe when the car is not in use.

Don't run the engine while the car is standing. Cars are fitted with self-starters and it won't damage the battery if it is used frequently.

Don't use the car needlessly. Exercise forethought; errands can be combined so that one trip to town will suffice.

Don't expose gasoline to air—it evaporates and is dangerous.

Don't use gasoline for cleaning the engine and various parts of the car—kerosene will cut the grease just as well and it isn't as expensive.

Don't mistake cheapness for economy—the best gasoline and oils are the cheapest in the long run. Once owners know the first principles of automobile carburetion and the proper care of the carburetor, they will find that it is not hard nor difficult, and what is more, they usually develop a pride in being able to keep their car in first-class condition.

When out on the road, follow the car driven by an expert and note just why he maintains a constant speed. He does not drag along and suddenly dash away at forty miles per hour as soon as he sees a clear road. More gasoline is used when you accelerate quickly, and it should not be done more often than necessary. Find a safe driving speed and stick to it, making gradual speed changes only when they become necessary. Economy, like temperance, is moderation.

DRIVERS AND MECHANICS WANTED.

THE American Red Cross has issued a call for 1,500 drivers and mechanics for immediate overseas service.

A school is being established in Chicago at which the accepted men will be given a two to four weeks' course of study comprising mechanical operation and military discipline.

Applications are being taken only from men over 46 years of age or draft exempted men due to physical defects or deferred classification. A fundamental knowledge of the automobile is required. Special appeal is being made to chauffeurs, garage and repair men as well as the person familiar with the automobile.

Forty dollars a month and maintenance will be paid after sailing. While in training, half pay and maintenance.

Requests for applications should be sent to H. P. Harding, Director of Personnel, Automotive and Mechanical Section, the American Red Cross, 528 Peoples Gas Guilding, Chicago, Illinois.

A SAFETY FIRST DEVICE.

A Driver Seldom Loses Confidence in His Own Driving Ability, He Usually Worries About the "Man Behind."

ONLY a short time ago I read in the paper of a bad accident, caused late one evening in this city. It happened that an automobile was driven up one of the

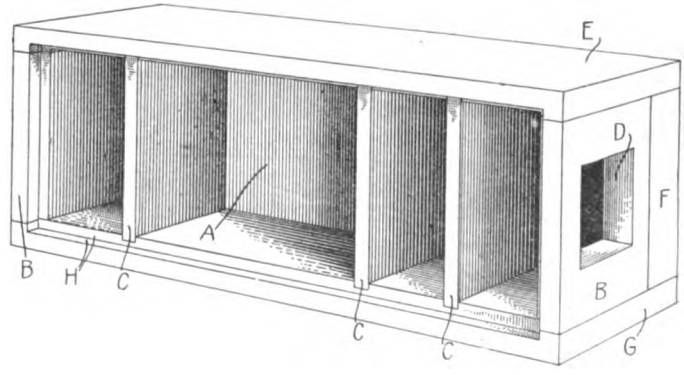


Fig. 1.—Construction of the "Safety First" Box.

Digitized by Google

side streets and made a sudden swerve to the left at an intersecting street. A car immediately behind the first, took this occasion to pass, and drove directly into the rear of the first car. Two people on the rear seat of the front car were badly injured and the driver of the second car went to the hospital with a number of severe

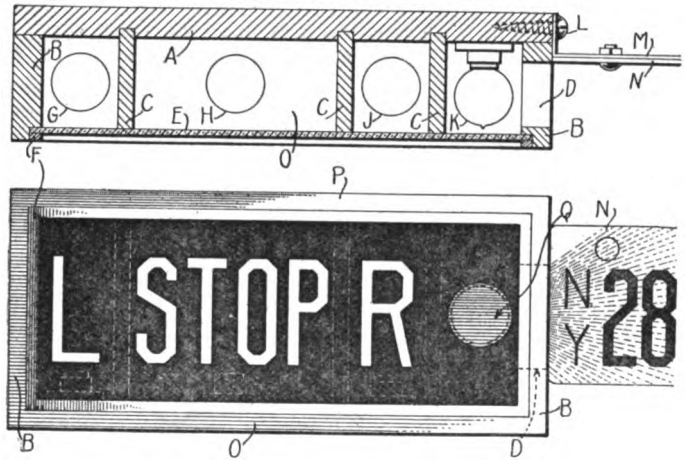

Fig. 2.—Plan and Back View of the Signal Device.

cuts upon his hands and face, caused by the broken windshield.

This accident would never have happened had the first car been equipped with a device such as is illustrated herewith. I have purposely designed this light so that it may be built very cheaply. Notwithstanding this fact, however, it may be made so that it gives a very good appearance to the back of the car, if properly constructed.

It consists primarily of a box measuring 9 inches in length, 4 inches in height and 2½ inches in depth, fitted with three partitions, as shown in Fig. 1 at C. The front of the box is solid, a hole is cut in one end, as shown at D, and a channel cut all the way around, as shown at H. In constructing this device the box is made first and a

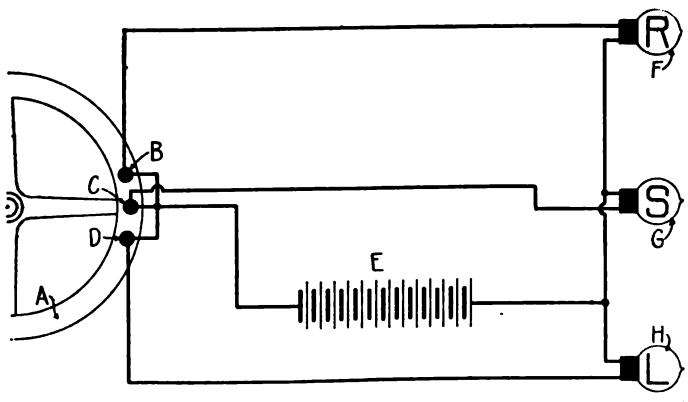

Fig. 3.—Wiring Diagram of Lights in Box.

piece of heavy glass fitted into the channel H so as to cover the back of the box completely.

This glass should first be coated with heavy black paint, then the letters "L," "Stop" and "R" scraped free from the paint, as shown in Fig. 2. The last compartment serves as a tail light and the circle, as shown at Q in Fig. 2, should be scraped free from paint also.

The circle Q should then be covered with red transparent coloring matter and the word "Stop" also treated in the same way.

This glass should be clamped into place by a square trimming piece, F. The top view and the rear view, as shown in Fig 2, clearly show the construction of the device.

The lights in the first three compartments should be fastened to the lower edge of the box, while the tail light is fastened to the back. A number plate hanger should be screwed to the front of the box, as shown at M and N. The tail light K is connected with the battery through the regular switch in the same manner that every tail light is connected, but the other three globes are wired, as shown in Fig. 3.

A three-button switch, or three ordinary electric button switches, may be mounted independently upon the steering wheel. A little pearl button measuring about ¼ inch in diameter may be obtained from any dealer in electrical apparatus. A grounded terminal, or outside terminal, of each button should be connected with one terminal of the battery, while a common wire to each of the lights should be connected with the other terminal of the battery, then the other terminal of each button should be connected with the other terminal of the light to correspond.

AN IMPORTANT UNIT.

Don't Think That You Can Slight a Grease Cup, Just Because It is Hidden Away Underneath The Car.

DOWN in back of the gear-set and flywheel or directly in front of it, but often hidden by frame members and body braces, is located a little piece of machinery that never gets its due amount of attention. This little piece of machinery seldom measures more than four inches in diameter and as many inches long, but upon it depends the operation of the whole car. If this little unit fails, it must be replaced with new or the car cannot go home under its own power—I speak of the universal joint.

The universal joint is nothing more or less than a clever combination of hinges which work back and forth approximately 72,000 times an hour. If you should run your car all day, these hinges would bend back and forth 576,000 times. Just imagine how many times they function in an entire season, but do you ever think of putting grease in the little grease cup which supplies the universal joint with lubricant? I will venture to say that you do not, or if you do, you only apply the grease perhaps once a season; you neglect this duty just because the

Digitized by Google

grease cup is so hard to reach. Even the hinges on a door require oil occasionally and they are seldom used more than 1/1000 as much as the universal joint on your automobile.

If the joint is surrounded by a case which is practically oil tight, and if the lubricant which goes into this case supplies the joint only, use a medium grade of grease. There is no reason for using a heavy cup grease at this point. It will simply harden and the joint will not receive sufficient lubrication.

I think it is safe to say that 90 per cent. of the knocks which occur seemingly in the gear set may be traced to the universal joint, and these knocks are caused by worn universal joint parts.

There is another reason why you should keep the universal joint in condition. Suppose that the joint has a play of one-quarter of an inch. Then when the clutch is engaged, power is transmitted to the universal joint and the resultant back lash wracks the rear axle and strains the engine. If there is an excessive amount of play in the joint therefore replace it with new, or at least replace the worn parts, else you may be called upon to replace both the joint and some of the gears in the rear axle.

The Construction and Repair of Radiators

Part 2.—The Methods Used for Repairing Ordinary Tubular Radiators, Removing the Tubes and Replacing the Fins

BY M. J. HENNESSY, M. E.

NEXT in order of precedence to the Honeycomb radiator is the tubular type. While this is without doubt the oldest form of radiator in use at the present time, its development for some inscrutable reason is comparatively recent. Owing to its simple construction, I believe that the time is not far distant when the tubular radiator will come into general use and gradually crowd all the other types out of the market.

While there are many details of construction in which one tubular radiator differs from another, the essentials are the same in all of them. The principal parts are two plates, called Header plates, shown at E and F in Fig. 1. The Header plates form the top and bottom of the core. The core itself is formed by tubes D which pass through the holes in the Header plates and are soldered fast on the outside ends. The fins are simply strips of thin sheet metal doubled to add to their rigidity and soldered along the side where the two edges come together; holes corresponding to those in the Header plates are punched in them and they are passed over the tubes.

The ends of the fins are soldered to the two sides of the core in order to keep them properly spaced. The sides B are simply two pieces of sheet metal, the ends of which are turned to form a seam with the Header plates and their sole object is to form a spacer for the fins. They have nothing to do with the water. The foregoing description applies to the ordinary type of radiator. Incidentally, this is the most popular form of the tubular radiator with which you will come in contact in the general run of repair work.

The Radiator Tank.

The next part of this radiator is the tank, or frame; that is the top and bottom of the radiator shown at A and C. This varies with the type of car it is to be used on. For a passenger car these parts are made of sheet metal, along the same lines as I have already described in the article on Honeycomb radiators.

For truck use, what seems to me to be a more sensible course, has been followed, and is fast coming into general use; that is, a cast iron frame. It is made of four pieces, a top and a bottom section, which form the tanks, and two sides which are only used as connections and supports for the top and bottom section. Sketches of these sections are

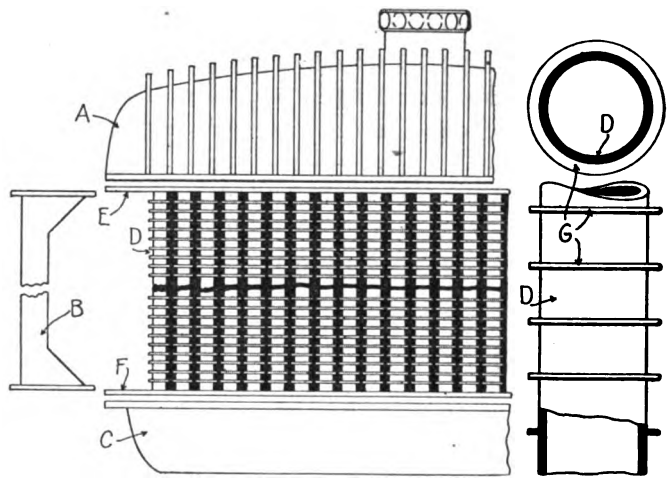

Fig. 1.—Sketch Showing Component Parts and Their Relation, of a Typical Tubular Radiator.

shown in Figure 1. Two cork gaskets are made to correspond with the two Header plates of the core. These are placed on the top and bottom plates and all five sections are bolted together.

In making repairs to a radiator of this style, it is well to remember that you can test it conveniently only when it is completely assembled, so you will do well to locate all of the leaks before taking the radiator apart. This is not as difficult as it would seem for the reason that when a tubular radiator leaks, it is, in nearly every case, the

Digitized by Google

result of an abrasion on the outside and is in consequence easy to see.

As a rule, unless the work is done by an expert, some difficulty will be experienced in soldering the test patches to the cast iron openings. If you have this trouble, you had better have a couple of pieces of radiator hose to fit the pipes. You can close the outer end of the hose with a piece of wood which has been turned down to size in a lathe. If there is no lathe at hand you can get the same result by using two flat pieces of wood about two inches wide clamped across the hose by a wood screw or stove bolt each side of the hose.

When you have a filler cap which screws on you can make it tight enough by putting a gasket under it. In the case of a hinged cap there is no way out except to solder a plate over it as described in the previous article on this subject.

Having tested the radiator and marked the leaks, the next thing to do is to take off the frame. If the job is of the bolted together type, this is also a simple matter. You will find one or two extra large bolts in each corner of the radiator. By removing these you will release the two sides of the frame; now take out the two rows of small bolts at the top and bottom and you can lift the two castings off, leaving the core free to work on.

Repairing Damaged Part.

We will suppose now that the radiator has been hit by something leaving a damaged space on the face of the radiator about four inches square and about an inch deep. As the tubes are set about one inch apart, we will have from three to eight of them to repair.

If the fins are not crumpled too badly you may be able to remove the tubes without cutting the fins. It is better to try this first. To remove the tubes, insert hot soldering iron in each end and hold it there until the solder lets go. The tube should now pull right out of the core. If you succeed in removing all of the damaged tubes in this way it will not be difficult to straighten up the fins. The material of which they are made is very pliable and with a little patience and perseverance you can bring them back to their original shape.

You may find, however, that the fins have been so battered by the object with which the radiator was damaged, that they will not allow the tube to pass. If such is the case, you will have to cut them. When you cut a fin try to cut it about midway between two tubes. Don't cut any more of them than you have to as it requires nice work to make them look right when they are repaired in this way.

Having removed the broken tubes in one of the above ways, the next step is to put in the new tubes. You can buy these tubes cut to the exact length from the maker of the radiator. In buying them from the maker you are sure also that they will be the right diameter, and this is of real importance, as it is absolutely necessary to have a good tight joint in the Header plates.

If the tube rattles around in the place you need never expect to make it water-tight. It can't be done. If you want a good, tight tube, first see that the sockets in the Header plates are perfectly clean and thoroughly coated with good, clean solder. Then see that the ends of the tube are in the same condition and that they are a tight fit in the sockets. Now coat the parts to be soldered with the soldering acid; push the tube into place and apply the heat by means of the soldering iron and see that the solder runs freely all around the joint. If you follow these directions to the letter you need not worry about leaks. It is the apparently trivial detail that makes or mars the successful soldering job. Solder positively will not stick on anything but *clean* metal.

Replacing the Fins.

Having soldered the tubes into place you will now have to replace the portions of the fins which you removed. The common practice is as follows: Take a thin pointed instrument and spread the cut ends of the fins enough to allow you to clean and tin the inside edges, cut off a number of pieces of sheet copper, brass or tin plate, have them about one inch long and a half inch wide, tin them and insert in the ends of the cut fins, then squeeze the ends of the fins together and solder.

In the majority of cases you can then take those portions of the fins which were removed, straighten them out and by cutting notches in them instead of the holes you can slip them in over the tubes and solder them to the plates which you have already set into the main part of the fin.

If you exercise sufficient patience and put the proper amount of solder on this part of the job, a customer will have extreme difficulty in locating the exact place that has been repaired. It is customary among the regulars in this line to give the whole core a coat of paint when the job is finished. This custom does not, of course, make it any easier to find the place. At the same time it is but just to say that there are a great many men in the radiator repair business who can take a tubular radiator that has been badly battered, and without putting a new tube into it, or without disturbing the frame, leave it so that it would require an expert to locate the place which had been repaired, simply by the splicing methods, which I have explained in detail in regard to the fins.

I do not recommend this method for those who have had only a limited experience in the field. They will find it much better to stick to the method which I have tried to make clear in the foregoing.

Assembling the Unit.

In assembling the radiator, use a good sheet cork for gaskets. *Don't try to use the old gaskets.* It does not pay. Use the gasket dry. If it is made right and fits properly you do not need any messy shellac or white lead coating. Place the core on the bench or stand it

Digitized by Google

with the bottom up. Set the gasket in place on the Header plate; set the bottom tank on the gasket, insert *all* of the bolts, and tighten them up. Don't put on a single nut until all the bolts are in place, and when you start to tighten them up, pull them up evenly and *pull them tight.*

Put the side members on next, simply starting the bolts in their places. Now turn the radiator right side up and attach the top member, using the same method as you did with the bottom. Last, tighten up the corner bolts and the radiator is ready for the car.

There is another type of radiator which is distinctly worthy of mention. I refer to what is known as the cellular type. It is the simplest radiator to repair that I know of and in reality is a horizontal tube radiator. It is practically all tubes, the tank portions being there only for the purpose of accommodating the inlet, outlet and filler holes. It consists of two large plates which form the back and front of the radiator. The edges of these plates are turned to form a seam, with a band which runs around the entire radiator. The face plates are filled with holes, set so close together that one wonders how they are kept apart, and in each of these holes is a copper tube, running from one plate to the other. To repair this radiator, you have but to insert a soldering iron in the offending tube, remove the tube and replace it with a good one, and the job is finished.

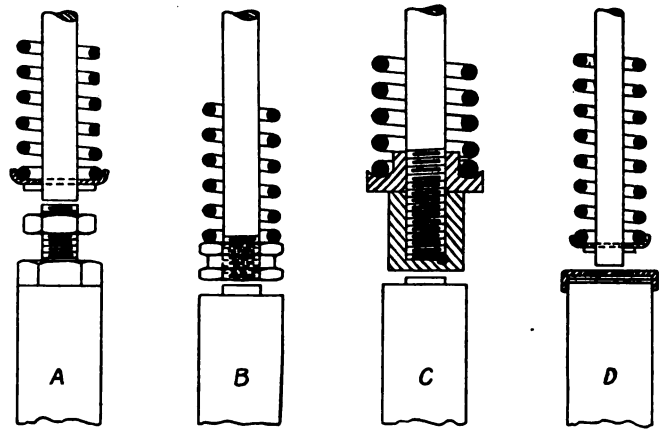
A neat temporary repair can be made by simply pushing a small cork into both ends of the tube.

Valve Clearance and Efficiency

An Engine Will Never Give Satisfaction Unless it is Kept Properly Adjusted, and the Valves Are Important Members

BY WM. H. STEWART, JR.*

FEW automobile owners, unless they have carefully educated themselves, know but little about their cars. They may know how to keep the body looking well, how to throw on the ignition switch, and how to shift the gears, but as soon as anything goes wrong with the engine they are absolutely helpless and are obliged to call in an experienced garage man for assistance.



Every car owner owes something to himself. He has invested considerable money in his machine, and he should know how to keep it in order, how to get the most power from it, and how to prevent depreciation, as much as is in his power. Invariably, when two or more car owners get together they are prone to boast about car mileage.

One obtains fourteen miles from a gallon, the other sixteen. They own the same type of car and the fellow who owns the car giving the best results is very prone to boast to the other one. The owner who does not get the mileage, usually dismisses the argument by saying, "Well, my car was a lemon anyhow."

There is an old saying that the leopard cannot change his spots. Let me amend this statement slightly as applied to automobiles by saying that any man can make a "lemon" out of a "peach." Perhaps this statement sounds just a little bit slangy, still it conveys the idea which I wish to impress on every car owner's mind.

When his machine comes from the factory, it is supposed to be mechanically perfect, as far as human ingenuity can make it. All of the parts have passed through the hands of one or more inspectors whose sole business is to see that these parts are perfect. In many cases these parts are calibrated to less than .001 of an inch in size.

The assembled machine must pass a very rigid test, and since it is made just like all of its brothers and sisters, so to speak, one can assume that it is as good as all of the other cars made at the same time or upon the same model. The car is in good condition when it leaves the factory. It only remains for the car owner to put it in poor condition, and he can do this very easily if he is ignorant of the mechanical principles of the machine.

Four Types of Valve Adjusters. A, Lock Nut on Tappet; B, Lock Nut on Valve Stem; C, Special Fitting on Valve Stem; D, Tappet Cap for Ford Valve Adjustment.

As an instance of what may happen to an engine, providing the operator does not know anything about it, let us consider in this article valve adjustment.

The majority of engines on the market today are fitted with what are termed poppet valves. These valves are operated through push rods or tappets by a cam-

Digitized by Google

shaft and opened at the proper intervals by hills upon the cams. When the piston starts on its down stroke, or shortly after it starts, in most cases, the cam on the shaft lifts the tappet, which in turn pushes on the valve stem and lifts the valve away from its seat, admitting fresh gas to the cylinder. At the end of the piston stroke downward, the cam permits the tappet to drop back into place and the valve seats again to prevent the passage of gas from the cylinder into the manifold.

The piston goes upward on the compression stroke, the explosion takes place, the piston is forced down again and shortly before the bottom of its stroke the exhaust valve is opened by a cam and the tappet, in a similar manner to that of the inlet valve.

The piston goes upward on the exhaust stroke, forcing the gas through the valve port into the exhaust pipe.

The valve lifting mechanism, therefore, consists of two rods, a tappet and a valve stem which may vary in length on different engines, but average about six inches, that is the distance between the valve and the cam is usually at least six inches. As the engine heats, these rods naturally expand, and if the valve lifting mechanism were all one piece, the valve might be held open at all times because of the lengthened metal.

To prevent this, a space is provided between the tappet and the valve stem. This space is called the clearance. Now let us consider the two things necessary for good valve action.

When an engine is traveling at a rate of 1,000 or more operations a minute, the piston speed is very rapid, the valves are held open an extremely short time. Suppose that the valve clearance on the intake valve happened to be extremely large. The push rod would rise upon the cam and just barely lift the valve. With such a small valve opening, only a small portion of gas could be drawn into the cylinders. The result would be the same as if one were to keep the throttle partially closed at all times.

Suppose the clearance in one cylinder were large and in the rest of the cylinders the clearance was approximately correct. One cylinder would lack power whereas the others would give maximum power at a certain throttle opening. Uneven engine action would result.

Let us assume the other extreme. Suppose the valve clearance were very slight. One engine might be started cold and the action would be even. As the valve mechanism heated and the rods expanded, the valve would be held open at all times, and if it were an inlet there would be great danger of fire passing back through the carburetor and igniting the gas in that unit.

If the valve were an exhaust, the gas would be forced out through the exhaust on the compression stroke and there would be a great lack of power because the compression would thereby be very low indeed.

Obviously, then, there is a certain valve clearance that gives the best results under certain conditions. Since average conditions are had when the engine is warm or after ten minutes of driving, the valve clearance should be adjusted, not while the engine is cold, but when it is warm. Another obvious fact is that this valve clearance should not be greater than necessary to provide for valve stem and tappet expansion. The clearance should not be greater than .003 of an inch after the engine is heated.

This amount of clearance can be determined by inserting a feeler gauge or by lifting the valve tappet when the valve has reached its lowest position. There should be just enough clearance between the valve stem and the tappet when the engine is warm for one to feel it with their fingers. When the engine is cold, however, this clearance should be more noticeable and often as great as 1/16 of an inch.

Practically all of the cars on the market at the present time are fitted with valve adjustment devices whereby one can control the valve clearance. The Ford car, however, is an exception to this rule and the question frequently comes up as to how the valve clearance on this car may be adjusted. After a few thousand miles running, the valve stems are worn and the valve clearance increases. Naturally this results in a loss of power and excessive carbon deposits in the cylinders because the exhaust valve does not open far enough.

There are two methods of valve adjustment open to the car owner. The first one entails a little work and is not always satisfactory, but merits description. Remove the valve and with a hammer "stretch" the valve stem, that is, place the valve stem upon a heavy piece of iron and pound upon the circumference of the stem all the way around until the stem is lengthened the required amount.

In doing this, however, be very careful not to pound on the portion of the stem which passes through the valve stem guide. The stretching should take place just above the valve spring pinhole. After the valve stem beneath the hole is pointed, its diameter is decreased and the wear is much faster.

The second method is the placing of caps over the tappet ends. These little caps are made of hardened steel and may be purchased at practically any Ford station. They are so arranged that they fit the tappet ends closely and as the valve stem wears the caps may be lifted off and small thin washers placed beneath them. The washers are a few thousandths in thickness, and lift the cap, thus decreasing the clearance.

If you are interested in the running of your engine, if you want to obtain maximum mileage, if you want to keep the engine quiet, and if you don't want road trouble, keep the valve clearance correct. It is one of the details that often escapes notice, but is of extreme importance.

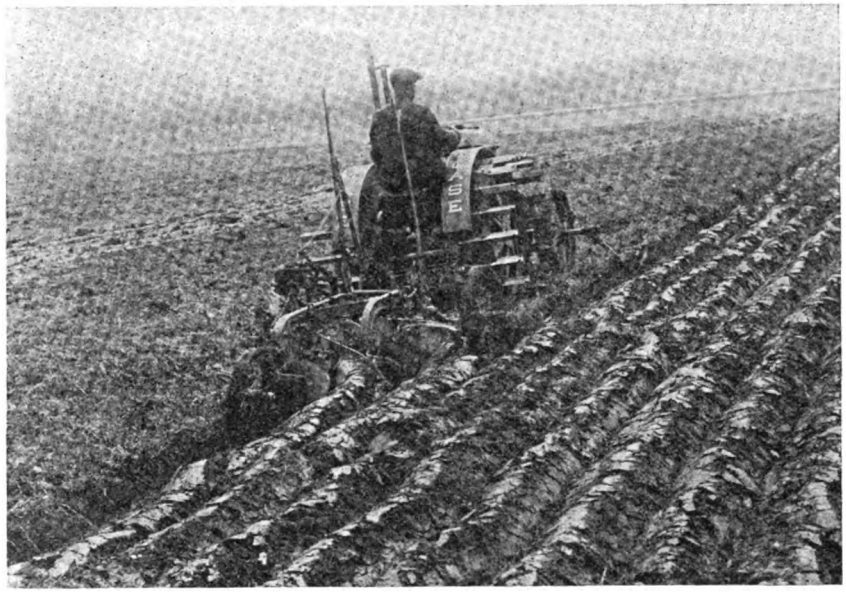
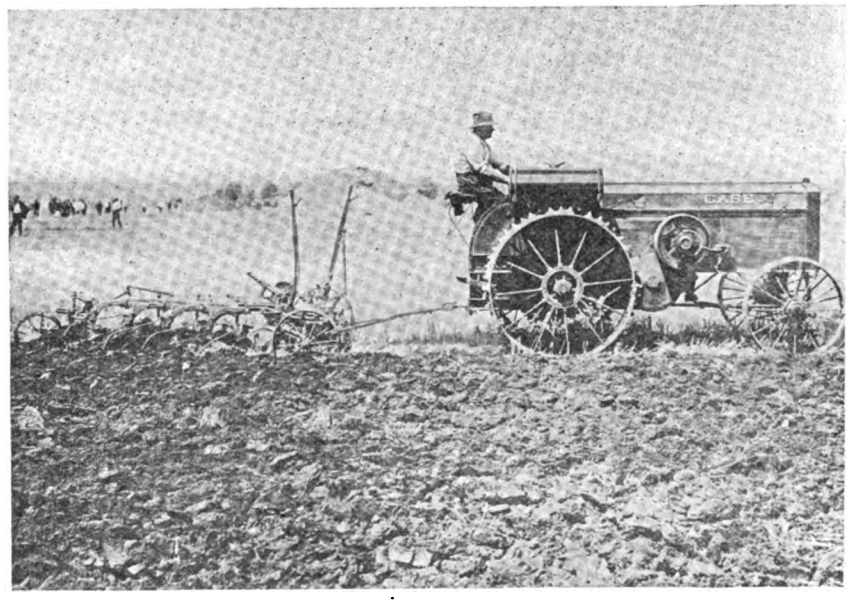
Yankee Bill's Idea of Business



The Old Adage, "Every Cloud Has a Silver Lining," is Surely True at the Present Time. Read What a Middle Western Garageman Says

BY F. L. PHILLIPS



"FOOD going up, taxes going up, coal going up, and business going down"—but I was interrupted at this point by the explosive utterance of Yankee Bill who burst out with "Say where did you get that story from anyway? This hammer is a bit too heavy to throw at you and I didn't want to hurt my arm or take a chance at missing you and breaking a window, but you're all wrong, mister, you're all wrong. When anybody tries to tell you that business is going on the bum, you can either put them down as slackers or idiots, because they don't know what they're talking about."

Before I continue my story a little word of explanation is perhaps best. Yankee Bill is a well-known garage man in Wisconsin. They call him "Yankee" because he comes from Connecticut, and because he says that "one ounce of Yankee ingenuity is worth more than a pound of Western brains."

"Yankee" always resents the inference that business

A Case Model 9-18 Tractor Hauling a Two-Bottom Plow in Heavy Soil. Work that Can Be Done at a Rate of Speed Greatly In Excess That of Horses and at a Lower Cost, Particularly Upon Large Fields and Long Rows.

A Case 12-25 Tractor Hauling a Gang of Plows Through Fresh Stubble, a Job that Would Require Two Horses and Two Men Can Be Done By One Man in Half the Time. Surely a Great Saving in Time and Money Is Shown.

Digitized by Google

is poor and I knew that unless I roused his ire a bit he would be too busy to talk to me any length of time, so I took a chance at the hammer and spoke as I did.

After delivering himself of his first remark, "Yankee" straightened his back like a watch spring, uncoiled his long legs from around a wheel and pulled himself from beneath a "contraption" which he was working on. I immediately placed one hand upon the knob of the door for safety's sake, and tried out my most winning smile which seemed to propitiate him a bit. At any rate, evidences of personal danger abated and he condescended to let loose a few more remarks in my direction.

"You know you fellers from the East make me tired. Out along the Atlantic you seem to think that the automobile business is all going hang just because somebody says that we can't get the metal. You seem to think that the whole United States is going to stop work just because that dern fool over in Europe is shooting off a gun or so. When the Yankee boys get over there, so that there is about one Yank for every hundred Huns, there won't be any war, there'll be nothin' but slaughter, and our boys will be the fellers to view the remains.

"There won't be any chief mourners either. I can't see how any automobile man is going to suffer this coming season. I don't know as I care whether I ever see another automobile or not, as far as business is concerned. I can do all the business I want to, simply by selling tractors and keeping them repaired. Look at this dern thing I've been working under all day. Yup, it's a tractor, or at least that's what the salesman called it when he unloaded it in this town.

"My name for it is 'big business.' It's one of the first ones ever put out and I don't think the owner would sell it or trade it for my bank account. He keeps the thing whizzin' along night and day almost, he doesn't give it any rest, and he uses it for everything except picking off potato bugs. He says he could gas 'um if he could only use the poisoned gas from the exhaust on his potato field.

"You see it burns kerosene oil, and believe me, he doesn't have to tell you about it. All you need to do is go out in the field with him some day when the thing is running.

"It ain't the only tractor he owns either. He just bought another one last week, or at least I bought it for him so that I could collect a commission, and he is as tickled over the new tractor as he would be over a new baby. He just made some comparisons 'tween what the new tractor could do and what he could do with this old machine shop, and found that the new machine would do just about twice as much work as the old. Still he hasn't any kick comin'. The old one does three times as much work as his horses did. Besides that he don't need so many men to run it. Of course he needs me, but then I don't count.

"The old tractor takes one man to run it and two men to keep it busy. That is where I come in. Since I started in business in this town I have sold ten tractors and since I sold them I have been one busy man! Ordinarily my automobile repair work keeps me busy, but since the tractors began to come like hot cakes, I have been making more money than ever before.

"Business poor? Not on your life! Not as long as the Government will let manufacturers turn out tractors and trucks, and I understand that Uncle Sam doesn't intend to stop the production of farm implements for some time yet. The boys on the other side need something to eat and as long as we can get the machinery over here I guess we can keep a stream of food going.

"Do you think that the farmers are as satisfied with tractors as you are?" I asked, for I was particularly interested in what the general attitude was in the West.

"Let me tell you of one instance that I know about. You can verify anything I tell you from Leon Wilson. He owns a farm about a mile up the road. Wilson has got about the best farm that I ever saw. I guess he owns as much as 200 acres of land.

"Last July, after all his crops were in the ground, every last one of his hired men up and struck. Leon is a cranky old cuss, and just like a balky 'long ears' in some respects; he wouldn't give in and the result was his hired men hung around two days, then left for parts unknown.

"For a week, Leon was sweatin' blood. He came down here one day and moped around like a hen with the pip. Then he went back and wrastled with the weeds and the bugs and other pests. I saw him one evening, long 'bout ten o'clock, chasing potato bugs with one of these here little flashlights. I guess he would have gone 'bugs' himself if I hadn't put a 'flea' in his ear."

At this point of Yankee's narrative, he was interrupted by an automobilist who came in for a tube, for Yankee carried accessories along with his regular line. He seemed to be a "Jack of All Automobile Trades" and believed in picking up every dollar that was wandering about without an owner. The unsuspecting autoist intended to buy a tube only, but left with a new tube, a box of tire talc, one dozen cementless patches and an extra special bargain in the shape of a new shoe. (Yankee knew how to sell things.)

"But the flea I put in his ear kept biting him until he woke up," continued Yankee, just as though he hadn't stopped at all. "And at the end of the week Leon stopped down to see me. We put our heads together and managed to scrape up enough cash to buy a tractor.

"It just happened that I had ordered a tractor, about a month before, for a farmer and I arranged with him

Digitized by Google

so that I could sell that machine to Leon, and hold off delivery to him for a spell longer.

"Leon had managed to get hold of a hired man by this time and together they made a fight with the weeds. They kept the tractor running night and day, until they began to catch up, then 'twas easy; that is, 'twas easier than before, but they worked like horses and if it hadn't been for the tractor I guess Leon would have lost some money on his farm. He's got a couple more hired men now and looks like easy sailing until harvest time.

"Well, if I don't get busy on this farm bus, I'll get poisoned with paris green if the old man catches me."

The Use of Kerosene As a Fuel

Heavy Fuels and Illuminating Gas Have Been Used for Some Time in England and These Fuels Have Proved Very Practical

BY SYDNEY F. WALKER, M. E.

KEROSENE, or paraffin, as it is called in the United Kingdom, was used to a small extent in the very early days of the motor car. In 1900, when a trial run from London to Bristol was undertaken, to see how the cars of that day would stand the continuous work, one of the cars was run on kerosene, and apparently did very well; all the other cars were run on gasoline.

Before the advent of the motor car, kerosene oil engines of the stationary type had been running in the United Kingdom for a long time. When gasoline began to rise in price, a few years before the war, attention was directed again to the possible use of kerosene for motor cars; and the writer understands that some of the motor busses in London tried out this fuel.

The difference between gasoline and kerosene, as all are doubtless aware, is: gasoline is a volatile liquid, while kerosene is an oil, with a certain quantity of volatile matter in combination. With gasoline, all that is necessary to enable one to burn it in the cylinder of a motor car engine is, that the pressure upon the surface of the body of gasoline from which the supply is taken shall be reduced. It evaporates immediately the tension of the vapor in the air in contact with its surface is lowered; and this is done at every suction stroke of the piston.

With kerosene, lowering the pressure upon its surface causes a certain portion of its volatile constituents to evaporate, but the body of the fuel passing into the engine remains in the liquid form, and the larger portion of it would either pass out through the exhaust, or pass the piston rings into the crank chamber.

In order that it may be used as a fuel, heat must be applied, and the oil converted into vapor and maintained in that condition until it reaches the cylinder.

It is interesting to note that, since the specific gravity of gasoline has increased so much over the original figure, from 0.67 to 0.72, the makers of gasoline carburetors have added heating apparatus to the float chambers; the heat is usually taken in these cases from the hot water coming from the radiator.

For kerosene, however, the heat is nearly always taken entirely from the exhaust gases; in a few cases the hot water from the radiator is used on the float chamber, and the hot gases later on. One thing appears to be absolutely necessary; the kerosene must be converted into vapor, the whole of it, and for that purpose plenty of heat must be applied right up to the inlet valve.

The arrangements for using kerosene are very similar; in nearly all cases a vaporizer is added, the kerosene being passed through the gasoline carburetor, sometimes before it enters the vaporizer, and sometimes after; in a few cases the gasoline carburetor is only employed when gasoline is used during the period of starting.

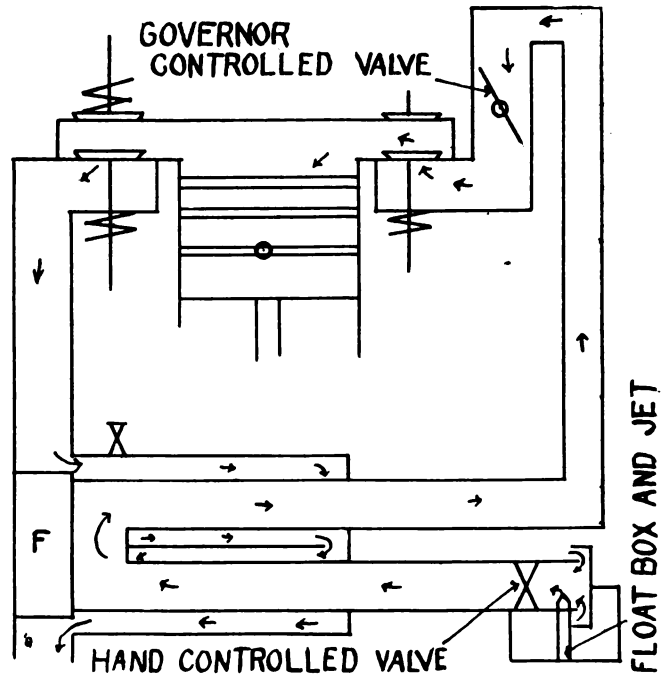


Fig. 1.—Diagrammatic Sketch of Thornycroft's Kerosene Vaporizer.

Fig. 1 is a diagrammatic sketch of the Thornycroft kerosene vaporizer, which has been applied to all kinds of store vans; tradesmen's vans, as they are called on this side; also to lorries up to five tons load. It is a

Digitized by Google

very fair example of the method employed, where the carburetor assists.

As will be seen from the drawing, the kerosene is first passed through the carburetor, and then through

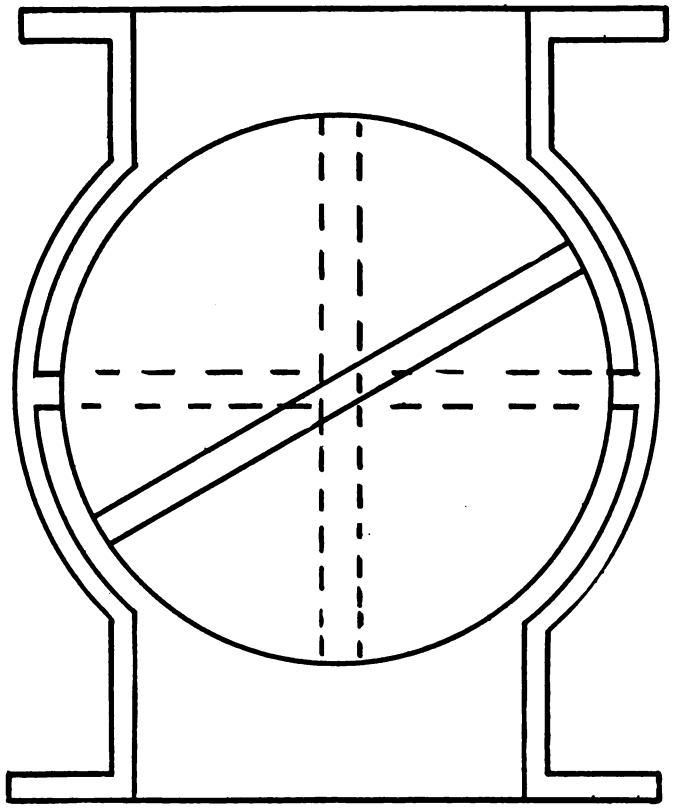

Fig. 2.—Section of Valve by Which More or Less of the Exhaust Gases Are Allowed to Flow Through the Vaporizer.

the vaporizer, the latter consisting of a system of concentric cylinders; the hot gases flow through the outer and inner cylinders, the kerosene through the middle cylinder, so that it is exposed to heat on both surfaces.

It will be remembered that the thermal conductivity of both liquids and gases is very low, and if a core of either is left, not exposed to heat, there is a possibility of a portion of the kerosene not being vaporized; the arrangement of the Thornycroft vaporizer overcomes this.

As will be seen from the drawing, the hot gases are led into the vaporizer, from the exhaust pipe, as close to the exhaust port as possible; and the quantity which flows through the vaporizer is controlled by the valve shown in section in Fig. 2. In the drawing, Fig. 2, the valve is shown at an angle of 45°, in which position part of the exhaust gases go through the vaporizer, the remainder flowing directly to the exhaust; if the valve is placed horizontally the whole of the gases pass through the vaporizer, and if vertically none pass through it, the whole passing to the exhaust.

The position of the valve can only be obtained by actual trial under each conditon. In the United Kingdom the whole of the gases are sent into the vaporizer when it is first put into operation, and gradually worked back until the best running position is obtained. If the vaporizer is too hot, the power of the engine is lessened, and if it is too cold, some of the kerosene passes through unvaporized. It is recommended not to allow the vaporizer to cool when stopping is frequent. Under ordinary running conditions, if this point is attended to, a stop of half an hour, which would usually be quite sufficient under all conditions, will not prevent restarting.

Another representative apparatus is the Smith-King kerosene carburetor, which is shown in section in Fig. 3, and to its action diagrammatically in Fig. 4. As will be seen, there are two float chambers, one for kerosene and the other for gasoline. As with other forms of apparatus, the engine is intended to be started on gasoline, a small quantity of which is carried on the car in a separate tank.

This form of carburetor has four jets, which deliver into the induction pipe, the pipe leading to the engine cylinder, through four different ports in a sleeve which slides over the jets, and uncovers the ports as it moves upwards or downwards. When the engine is at rest only the gasoline port is open, and as the engine warms up and attains speed, one port after another is opened, the kerosene coming into operation as the different ports open and the gasoline port being closed when the last kerosene port is opened.

The action is perfectly automatic; if the speed of

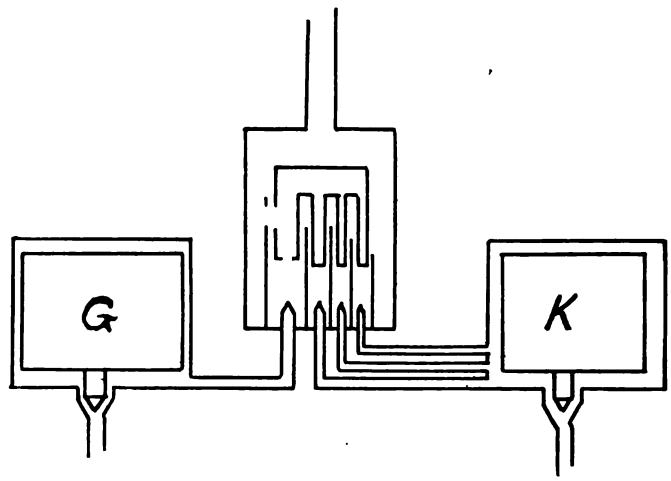

Fig. 3.—Sectional Drawing of Smith King Carburetor for Gasoline and Kerosene. G, Is the Float Chamber for Gasoline Fitted with One Jet Only; K is the Kerosene Float Chamber with Three Jets.

the engine falls below a certain figure, as when a car is held up by a block in the traffic, the gasoline comes into operation to provide for the acceleration when the block is opened, and it is shut off again when the car gets up speed.

In this apparatus the kerosene float chamber is heated by the hot water from the radiator; but in addition a "muff" is provided, as shown in Fig. 4, enclosing the pipe leading from the carburetor to the engine, and exhaust gases are made to flow through this muff, the object being, as explained above, to keep the kerosene in a state of vapor; if this is not done, if the vaporized kerosene is exposed to the atmospheric temperature,

Digitized by Google

there is a considerable danger of a portion of it at least being condensed, and passing through the cylinder unconsumed.

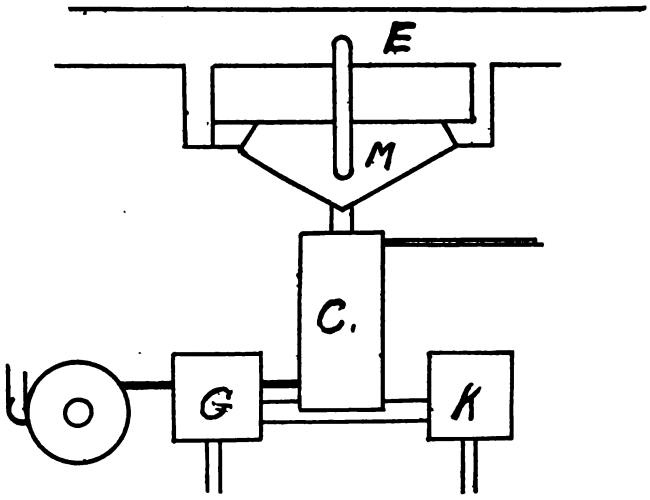

Fig. 4.—Diagrammatic Sketch of Smith-King Carburetor for Kerosene and Gasoline. G and K Are the Float Chambers; C the Jet Chamber; M the Muff Connected with the Exhaust Manifold; E, Intake Manifold.

There are several methods of using the exhaust gases to heat the kerosene, and to maintain it in the condition of vapor, but they are variations of the above.

The Question of Starting.

One of the greatest difficulties has been starting with the engine cold, and the kerosene cold. With several forms of apparatus the arrangement employed in the Smith-King is used in various ways: gasoline being employed when starting, and the supply shut off immediately the engine is warm and there is a sufficient supply of heat from the exhaust gases to vaporize the kerosene.

A method in which an electric heater is used as an auxiliary will probably be interesting; it is shown in Fig. 5. The kerosene is made to pass through a heating pot, in which there is an electric heating element as shown in the figure. When the engine is to be started the electric element is heated from the starting, or lighting battery, and the vaporization is stated to be sufficient in from two to three minutes for the engine to start on the kerosene vapor alone.

With this apparatus a muff is also provided around the pipe which carries the vaporized kerosene into the cylinder; and in addition, in place of heating the bulk of the kerosene by a jacket of hot gases, it is heated by the addition of a small quantity of the exhaust gases themselves, between the throttle and the inlet valve.

In another method of starting and of vaporizing the kerosene which is interesting, solid fuel, charcoal anthracite or coke is employed; the fuel is held in a circular vessel fixed above the engine, and spiral ducts are cut on the inside of the fuel chamber, through which the kerosene is made to pass on its way to the induction pipe of the engine.

Vertical grooves are cut in the side of the vessel also, cutting the spiral groove and providing an easier path for the lighter hydrocarbons that are evolved first from the kerosene. The idea is, there is a considerable difference in the time required for the lighter and the heavier hydrocarbons to gas away; the lighter ones flow down the vertical grooves, and the heavier ones follow the spiral grooves, all of them being in the end completely vaporized. The solid fuel is lighted at the bottom before the engine is started up, and it is only when a certain amount of heat has been liberated in the fuel chamber that the kerosene is allowed to flow from the carburetor into the spiral groove.

Where gasoline is not available, the Thornycroft apparatus, and some others, can be started, as many stationary oil engines still are, by heating the vaporizer with a blow lamp.

Efficiency of Kerosene Driving.

The efficiency of motor car engines designed to work with gasoline is less with kerosene, partly due to the lower calorific value obtainable from the kerosene, partly to the fact that kerosene works best with a lower compression than gasoline, and partly from the fact that unless the pistons are fitted with special rings, and great care is taken that none of the kerosene is condensed

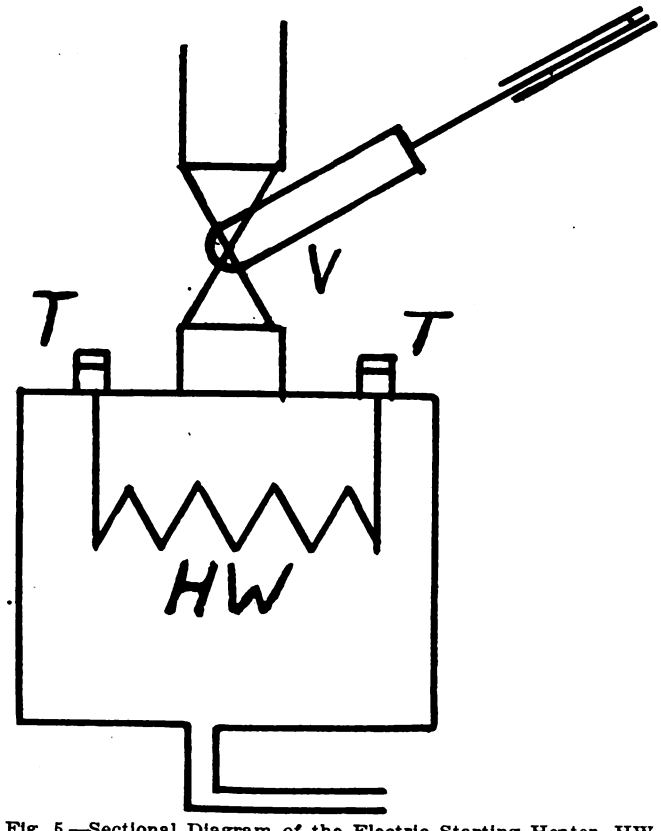

Fig. 5.—Sectional Diagram of the Electric Starting Heater. HW, Heating Wire; TT, Terminals for Switch and Battery Connections; V, Butterfly Valve.

when it enters the cylinder, there is considerable danger of a portion of it working past the piston rings and mixing with the lubricating oil in the crank case.

Makers who have specialized with kerosene recommend that the oil shall be removed from the crank case more frequently when kerosene is used than with gasoline, so that this difficulty can be obviated.

MISSING NUMBERS—Our readers are requested to remember that we are always pleased to re-send numbers which have gone astray in the mails.

MAY THE WORLD BE ILLUMINED BY THE LIGHT OF LIBERTY

How to Read and Profit by the Articles in Our Magazine

RATHER a peculiar title to this editorial, isn't it? But it isn't half as queer when you think about it. We find that many readers do not always know just how to read our magazine; for instance:

Not long ago a subscriber wrote us the customary letter of satisfaction saying that all of the articles were interesting, but that he liked a certain type of article better than others, some of them he seldom had time to read.

That subscriber did not get the full value for his money—we gave him full value—but he did not take advantage of his chance; he didn't read every page as he should.

Don't pass over an article because the title does not interest you. The story itself may contain suggestions that are of the utmost value to you. If you are a car owner, read the garage stories, they give "inside dope" on garage practice. They tell how certain work is being done, or how it may be done in the cheapest manner, and if you are familiar with general practice you will not permit the garageman to overcharge you.

If you are a car owner or a mechanic, you may say that the advertising articles do not interest you. BUT THEY SHOULD. Self-advertising is the most valuable and greatest art in the world. A self-advertised man is always successful; provided he knows HOW to advertise himself. Read the advertising articles, they tell you how.

We make one big claim for our magazine. It is 100 per cent efficient, it has no useless word fillers, nor ornate pictures. It may not appeal to an artist or a person who cares only for pretty pictures—but it DOES appeal to the man who wants mechanical information that he cannnot obtain from books. This magazine is "all wool and a yard wide."

Concerning the "Post Mortem" of the "Sick Car Series" in October Number

THE Undertaker and the Graveyard" is the leading article for our October number. We choose to consider it as a "Post Mortem" or Obituary of the Sick Car series, the last of which appears in this issue of the magazine.

Doubtless all our readers have enjoyed these articles as well as profited by them. They are written for the purpose, primarily, of instruction, and secondarily, to make them as interesting as possible without detracting from their value.

The Undertaker and the Graveyard is the same type of story and is very appropriate at this time when it devolves upon all of us to conserve as much as possible.

We don't want you to make a mistake when you read the title of the article—don't think that it deals with automobiles whose days of usefulness are over—for it doesn't; it tells you how to resurrect a "dead one," or one that is almost ready for the junk pile.

Sell Trucks and Tractors, Is One Solution of the Dealer's Problem

THE general consensus of opinion would indicate that the passenger car production in 1919 will be cut down to a negligible figure. If the manufacturers cannot obtain the necessary steel, then the industry will suffer and the question at once arises, what will the passenger car dealers do to maintain business?

There has been too much specialization in the industry; a man who sold cars did nothing else, he knew how to dispose of new cars, but he did not care about mechanics, since that branch of the business did not enter into the transaction to any extent.

Obviously, there will be many dealers who will be obliged to close shop if the 100 per cent curtailment goes into effect; but there will be many who keep up their salesrooms. The far-sighted dealers will have prepared for the storm, to use a figurative expression, trimmed their sails and have gone on another tack.

At the present time there is an enormous demand for

Digitized by Google

both trucks and tractors. As evidence of what may be done by means of trucks, consider the city of New York. Practically all of the produce, wearing apparel, building material and other necessities of life, used in Greater New York is trucked from factory to terminal or distributing points. Foodstuffs are trucked from terminals to consumer and distributer, and though horses are used in great numbers, motor trucks are increasing in number.

Without motor trucks, the transportation facilities of New York would be entirely inadequate and the merchants and business men are beginning to realize that a truck replaces horses, teams and men; saves time and money; and makes quicker deliveries possible.

Within two years motor trucks have graduated from the "possibilities" class into the "probabilities" class; within another year the truck will have advanced into the class of "necessities."

So it is with the tractor. The farmer, who heretofore has not realized the possibilities in extensive cultivation of land has been confronted with a serious problem, that of cultivating what land he owns without sufficient labor. A tractor is itself the solution of the problem, and in addition it makes possible the breaking of more soil than ever before, despite the dearth of help.

The farmer is just beginning to realize that his income may be doubled, or trebled providing he can afford the necessary farm machinery. He can be made to see the value of a tractor as an all around utility machine.

It follows, therefore, that many of the present automobile salesmen will find ready employment by the sale of trucks and tractors. As many more will turn toward the repair field. There is no reason why both branches cannot be taken up and the dealer's organization kept intact until the war is over and the production of passenger cars again commences.

Only the Yellow Dogs Drove Their Cars for Pleasure on Sunday

ON August 29th the Fuel Administration requested that automobilists should not operate their machines for pleasure purposes for the next four to six Sundays. The reason for this request was to prevent a serious shortage of gasoline. It was a patriotic measure and met with a fine response throughout the country.

Statistics indicate that only about 15 per cent of the automobile owners ignored the request and continued to operate their cars as usual. Fifteen per cent of the people decided that their own personal pleasures should be placed before the welfare of the country.

We have in mind the census taken around Boston which seemed to indicate that a large percentage of those who operated machines were of the wealthy class, that is, only a very few Fords were in operation on the first Sunday on which the request went into effect.

Perhaps those people feel that they have done their duty in purchasing Liberty Bonds. What a fine patriotic spirit those people show! They were willing to lend Uncle Sam their money providing Uncle Sam paid them more than they could obtain from the banks. How about the poor people who not only loaned their money but made tremendous sacrifices as well?

We hope that the police will see fit to publish the names of all those egotistical and selfish car owners. We hope that the finger of scorn will be pointed at all of those german sympathizers, for are they not helping along the cause of germany?

We trust that all of our readers will do their best to discourage Sunday riding as long as the Government requests.

Prevent these yellow dogs from driving their machines upon the streets if possible, and if this cannot be done make their Sunday pleasure trip a nightmare by telling them what you think about them.

Possibly they can afford to buy gasoline, but does their money pay for the lives of the boys we are sacrificing on the other side? Ask them what they are doing to win the war. You know that they are trying to lose it, if you see them riding in a machine. They are stealing the fuel which belongs to our fighting forces. You are paying for it, not they.

It is people such as they that are prolonging the war and crippling our fighting forces. If everybody ignores the Fuel Administration's request, the war will be prolonged and these people that own automobiles will be taxed more heavily to meet the demands. Fuel for Sunday pleasure riding cannot be paid for in money.

Back up the boys at the front by sacrifice rather than by mere empty words. Don't expect someone to do your fighting for you unless you can do your part in helping fight.

If you cannot put on a uniform and go over the water don't be a cur and steal the necessities from those who are men enough and women enough to sacrifice their lives and their business by going across. Do your part and see that your neighbor does his part too.

If he is not willing to, find some way of making him. This is your fight just as much as anyone's else. Remember that we have a big fight on our hands in America as well as in germany. Don't be a shirker. Do your part and then do some more.

Let Your Deeds As Well As Your Words Prove Your Patriotism

LAST Wednesday afternoon a large seven-passenger touring car was stopped on Brooklyn Bridge by a khaki-clad young man who seemed to be in a hurry to get across the bridge. The writer heard the young fellow ask the driver to take him across but the driver refused to do this.

The driver was a young fellow who appeared to be about twenty-eight years of age and was undoubtedly

Digitized by Google

within the draft limit. That man was not only a slacker, but a selfish, unpatriotic person who did not deserve the title of an American. He is the sort of man that should be drafted into the service under any condition. He should be made to fight, for it is the only way that patriotism can be brought into his sluggish brain.

Anyone who is not willing to stand behind the boys who are risking their lives for the country ought to be branded by their fellow citizens as cowards.

Suppose that all of us make a vow to ourselves that we will do our part and be kind to those fellows who are doing our fighting for us. Next time we go out in our machine, let us look around and try to find some soldier boy who won't have a chance to ride in an automobile for some time, and let us give him a "lift." We may be slackers because we have to, but let us do all we can to soften our title. Let us put a sign upon our windshield, "Boys in uniform hop in. The pleasure is ours. You are welcome."

What Makes the Difference Between Successful and Unsuccessful Men?

IS it not largely that the one does things, and the other thinks about them, but does not do them?

Now, it does not matter how many excellent plans, in a business way, may occur to you. Unless you put those plans into execution in some shape or other, they will never be of any value to you. They are like a seed that has never been planted.

It is related of General Grant that when the Chattanooga campaign was at a standstill, and nobody seemed to know what to do, he went down there to find out what the trouble was. He asked the general in command, whose name the writer does not at the moment recall, but who was probably Rosecrans, what he had contemplated doing. The general showed Grant a plan that he had formulated, and Grant read it over carefully. Then he said: "Your plan is well enough; why didn't you execute it?"

The result of Grant's trip was that he issued some orders immediately, which were promptly executed, and the whole difficulty was cleared up.

Some people are credited with what is called "executive ability." These two words look rather formidable; but what is executive ability, anyhow, except the capacity for doing something—doing it promptly, or arranging to have somebody else do it; it does not matter which? The man who wins great success can't do it entirely by his own personal exertions. He has got to employ others, and must see that those others execute his plans. It is in seeing that plans are executed that "executive ability," so called, comes to the front. But these rather high-sounding words can be summed up in two plain Anglo-Saxon words. "Doing Things." The man who does things has executive ability, whether he does them in a small way or a big way, or whether the things he does turn out well or not.

Some people think of a plan, and keep thinking of it, week after week, and perhaps tell all their friends about it, but do nothing. The plan may be good or bad; you can't tell until you try it. Most of those who succeed try a whole lot of ways of doing things, and many of those ways turn out badly, but some of them are good. The only thing to do is to keep right at it. When one plan doesn't succeed, try another, until you hit upon one that is successful. There is nearly always a way, if you can find it.

Executive ability will not alone make a man successful. He must understand his business so well that offhand he can decide any and every question that each day is quite sure to present itself for consideration and solution. He may not always decide right; nobody does. But it is better to decide, even if one is wrong, than to waste time weighing pros and cons. Wrong decisions are not apt to be made twice, with respect to the same question. It is by practice of this sort that we learn to reduce the percentage of incorrect decisions.

To lift yourself above the average and stay there, you must know a little better how to do things than the average man does, and the acquisition of this kind of knowledge takes time. Any man pursuing some avocation steadily, is likely to find himself past forty before he can see over the heads of the competitors in his line. When this happy time arrives, he may consider himself on the high road to a successful career.

Loan the Government Your Money and Help Lick the Beast of Berlin.

THE time has come again when we must all dig down into our pockets for more money to win the war. Wo do this with a glad heart because in the first place we know that our cause is just. We know that every dollar we loan the Government means another nail in the kaiser's coffin. We know also that we are only loaning it, and we are loaning it at a rate of interest in excess of that which we are able to obtain at the banks.

The government, however, must have the money or our boys will have been sacrificed in vain. Everyone should do their own part not only by loaning money but by influencing others to loan money. Employers should organize "Win the War meetings" and do their part in influencing their employees to subscribe. It is to their advantage that the money be furnished. It is not only to their advantage but to the advantage of every citizen in the United States. If we do not whip the germans in Europe, we will be obliged to fight them on our own soil sooner or later. Let us do a good job while we are about it NOW!

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.

The object is to encourage every operator of a motor vehicle to be careful and avoid accidents, especially the inexcusabe accident of a collision at a railway crossing.

THE past two numbers of this magazine did not contain our Life-Saving Department page, for the reason that we had so many mechanical articles of interest that we did not have room for it. It is not our intention, however, to discontinue this valuable department.

We feel that the autoists throughout the country should be warned repeatedly against accidents. We do not feel, nor do we wish to infer that any of our readers are careless. At the same time, however, it is not always the careless person who suffers in an accident.

The victim may be entirely innocent of wrongdoing, yet suffer because someone else has broken a law or overspeeded. Carelessness is, and always has been, the direct cause of 90% of the accidents occurring. A small percentage have been due to intoxication, while an extremely small percentage have been due to faults in the car itself. The manufacturers deserve commendation upon this fact and we doubt that there would have been any accidents due to the failure of car mechanism had not the car been strained through careless driving or excessive speeding.

A Peculiar Accident: An extremely peculiar accident occurred near Philadelphia early this month when a girl was badly injured through falling from a rapidly driven automobile. It seems that the car was crowded and the girl was leaning against the tonneau door which was not fully latched. The door swung open and the girl was precipitated into the street.

Driving While Intoxicated: Early last week an intoxicated driver in Salt Lake City drove his machine past another which was being operated at a fair rate of speed, driving directly into a young lad who was standing within a safety zone at the intersection of two streets and killing him instantly.

Out Joy Riding: Seven men riding in an automobile along the lake shore road at Buffalo were injured when the machine in which they were riding collided with an auto truck upon the road. The auto truck was being driven at a normal rate of speed and the automobile did not give the truck sufficient road in which to pass.

Reckless Driving: An eighteen year old boy of Philadephia is being held by the Deputy United States Marshal for trial before the Federal Court. The young man, who was at the time of the accident in charge of a mail truck, was carrying three young women, as passengers. Witnesses say that his car was being driven at a high rate of speed and failed to negotiate a turn. It rolled over twice and pinned the girls beneath it. Two of the young ladies are at the hospital seriously injured.

Jealousy in Speeding: Just because a Ford car driver tried to get ahead of a large Hudson car at a dangerous curve, in Providence, an aged man is now suffering serious injuries at the hospital. The driver of the Ford car was operating his machine at about fifteen miles an hour across an intersecting street which was hidden by billboards at each side. He was recklessly speeding simply because he was trying to outdistance a larger car.

Excessive Speeding: Because a driver of Esterville chose to ignore one of nature's laws that a turn cannot be negotiated at an excessive speed, he is at present held in jail awaiting trial for the murder of two persons. He claims that he did not know the road and tried to make a sharp turn at a speed of approximately 45 miles an hour. The car overturned and pinned two of the occupants beneath it, killing them probably instantly. The third passenger escaped with a few minor cuts.

Makes Wrong Turn: While driving his automobile along Clinton Avenue, Newark, New Jersey, a young man carelessly turned his machine to the left rather than to the right when meeting a trolley car. The wheels caught in the track and the machine was practically demolished by the car. The driver was badly injured and taken to the city hospital.

Injuries Inflicted Wholesale: A short time ago a motor truck operated at a high rate of speed down a hill in the Bronx, New York, leaped the curb and ran into a crowd of children playing upon the sidewalk. A number of the children were badly injured and carried to the hospital. Witnesses say that at the time of the accident, the chauffeur was not intent upon his job, but was lighting a cigarette and had but one hand on the wheel.

Boy Crushed by Automobile: The lights of an automobile operated in Richmond, Virginia, were not working properly and the chauffeur drove the machine into an alleyway with which he was unfamiliar. The machine hit a small boy who was playing and pinned him beneath the bumper and the wall at the end of the alley. He is at present in the hospital and but little hope is held out for his recovery.

Nonsense, and Some Sense

Facts That Are Sprinkled With Jest Often Stick Longer in the Mind Than Rows of Plain Figures

You can fool a horse, sometimes, by feeding him sawdust, but you can't make your engine run on water. Make a point of draining the carburetor once a month; a drop of water in the carburetor does as much damage as a quart in the cylinders.

* * *

You may like to work on your machine, but don't spend two hours trying to find a cotter-pin hole, mark it on the end of the bolt with a punch or chisel.

* * *

Don't try to use kerosene oil as a lubricant; it won't work. Drain the oil from the crankcase every month and replace it with new.

* * *

Dirty hands are not always a sign of honest toil. Rub soap lather into the pores of the skin before working on your machine, the dirt will come out with the lather. Soft soap under the fingernails obviates that "line of crepe."

* * *

A nut tightened in time saves buying a new engine. Loose nuts and bolts are like germans: they raise "the Dickens" generally.

* * *

Smooth runs the auto when the springs are greased.

* * *

A hole in a tire is like a hole in the pocket where you keep your money; mend it.

* * *

Noise is not always an indication of power; remember this when you open your muffler cut-out. It may sound good to you, but your neighbors may think you are nothing but a little boy with a new toy.

* * *

Kerosene oil is a mighty good liquid for removing grease and dirt from a machine, but remember that it will also remove paint and finish as well—perhaps that's why the finish on your car doesn't look like new.

* * *

A stiff steering gear will keep your car running in a straight line; but not all roads are straight, some of them have turns.

* * *

A hammer and a cold chisel together can be used in place of a wrench, but it is always best to use this substitution on someone else's car.

* * *

If you want an excuse for buying a new car and discarding the old, wait until November before you put the anti-freezing solution in the radiator.

The man who races his engine and the "fool who rocks the boat" should be put under the same classification.

* * *

If a man tells you that he can get twice as much mileage from a gallon of gasoline as you, don't call him a liar, see how he does it, he may be telling the truth.

* * *

I saw an engine, not long ago, that had been run for ten minutes without either water or oil—it was in a junk yard.

* * *

Any fool can run an automobile at sixty miles an hour over a steep embankment, but it takes a strong and rugged man to survive the experiment.

* * *

An oil-soaked rag and a garage fire often go together; if your car is not insured, don't keep oily rags in the tool box.

* * *

If you want to be kept in blissful ignorance about the "insides" of your automobile, don't read the Automobile Dealer & Repairer, it gives too many mechanical suggestions—read a cook-book.

* * *

When your engine knocks, it means that it wants to get in—to a repair shop.

* * *

Sand is a good thing to have in business, but a mighty poor thing for an automobile clutch.

* * *

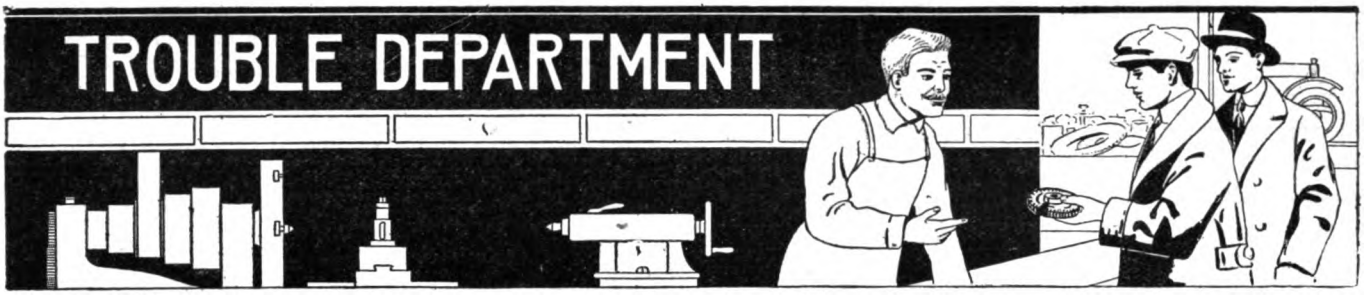
One can usually stop a car, moving at 25 miles an hour, by applying the brakes, but it often takes an express train or a stone wall to stop a machine traveling at 60 miles. Which method do you prefer?

* * *

It is a fact that if every automobile driver in the country obeyed the law, we would need only one-tenth as many traffic officers.

* * *

No, your liberty bond is not a license to drive your car on a gasoline-less Sunday.



* * *

If you want to commit suicide, go into your garage, close all of the doors and windows and start the engine. Even a pulmotor cannot frustrate your plans.

* * *

A piece of crude or sponge rubber will usually put a quietus on a weeping radiator, stuff it around the leak and press it down with a cotter pin puller or an ice pick; rubber cement can often be used for the same purpose.

Use Cotter Pins.

2491

From John Kelly, New Jersey.—In taking up bearings, both main and connecting rod, a cotter pin is used to secure the nut on bolt. Would not a heavy lock washer do as well?

Reply.—A lock washer may answer the purpose all right but there is always the question of its effectiveness. You might tighten up the nut upon the washer enough to hold the nut in place, but sooner or later the spring tension on the washer might decrease enough to allow the nut to unscrew because of the vibration. We would not advise you to use a lock washer upon any moving part of the automobile for by doing so you might take a chance and damage the machine very greatly.

Cylinder Scoring.

2492

From Fred Kegel, Ohio.—Will you kindly tell me the common causes for cylinder scoring? How can cylinder scoring be prevented? If one cylinder lacks compression will the engine be apt to run unevenly?

If kerosene or alcohol is poured into the cylinders while the engine is hot to remove carbon, will the cylinders be scored? What causes the brake drum on a Ford car to groove? How can it be prevented?

Reply.—There are a great number of causes for cylinder scoring and occur in about the following order: Lack of lubrication, broken piston rings, dirt or carbon in the lubrication, overheating through lack of water, or any other cause, loose wrist pin or excess carbon.

If one cylinder is scored and the compression is much lower than that of the other cylinders, the engine will run unevenly and will not develop its full amount of power. If alcohol or kerosene is poured into spark plug holes while the engine is hot in order to dissolve the carbon, the cylinders will not be scored if you are careful to crank the engine four or five times before starting it.

The reason for the scoring of the Ford brake drum is lack of lubrication, but if you lubricate this part you will destroy the braking properties. There is no remedy for this with the regular equipment. The only thing you can do is to purchase a new expanding brake which is covered with a fabric facing. These you can obtain at practically any automobile supply house.

Relative to the scoring of cylinders, if you have an engine in which one cylinder is scored, or even all are scored only slightly, you might try the following remedy, which often restores the compression for many days or weeks. Start the engine up and run it at a normal speed. Then pour into the carburetor intake about a teaspoonful of Dixon's Flake Graphite. This product has a tendency to fill up the small scores in the cylinder walls and so restore the compression. You may be obliged to clean the spark plugs frequently, the first day after applying graphite. After that, however, the graphite will fill in the scores and your engine will run normal.

Locomobile Wiring.

2493

From R. J. Martin, Massachusetts.—I have a Locomobile, 1915 model, fitted with a Westinghouse system. There is a live wire which leads from the generator to the switch and also connects through the voltmeter to the ground. Why doesn't this live wire exhaust the battery?

Reply.—There should be no live wire between the dynamo and the volt meter to the ground, except when the engine is being run. As soon as the engine is stopped the volt meter should register zero, providing there are no lights being used. The current from the battery passes from the battery through a magnetic cutout to the starting motor, through the starting motor to the ground while the engine is being started.

Current for ignition system passes from the battery through the ignition switch and fuse blocks to the ignition coil. As soon as the engine starts the dynamo begins to operate, generates current which passes from the dynamo through the volt meter to the ground, back to the battery, through the battery and switches back to the dynamo again, through the magnetic cut-out which prevents battery discharge or dynamo charge as long as the dynamo is operating at low speeds. As soon as the dynamo speeds up, however, the magnetic cut-out closes and permits the current to charge through the battery. The wire passing from the volt meter should not be live until the dynamo is generating enough current to charge the battery.

If your volt meter registers when the dynamo is stopped, it is an indication of a short-circuit at some point, or an indication that the magnetic cut-out is not working properly. In this case, it would be necessary for you to have the system looked over by some expert repair man.

Chevrolet Head-Light Trouble.

2494

From Earl R. Smith, Kansas.—I have a Chevrolet car, 1918 model, and am having trouble with the lights. The lights are all right until the switch is turned to the dim position, then the left headlight goes out and the right light stays as bright as ever. Can you help me with a suggestion.

Reply.—We are sorry that you did not tell us which model machine was used. The two models are wired differently so that we are unable to furnish you with a diagram unless you give us more details. Doubtless, however, you can locate the trouble easily enough by following the directions given below. If you are unable to do this, let us know immediately the model of your car, the model of the generator, the model of the motor and the model of the starting switch. Be sure to send us a sketch of the present wiring of the light switch as there were a number of these switches used.

With both lights going at their full candle power, the current should pass from the battery to the switch, a portion of it from the switch to each headlight. With this switch position the current passes back from the left headlight through the switch to the ground, while the right headlight is grounded directly to the frame. With the switch at the dim position, current should pass from the battery through the switch to the left headlamp, back from the left headlamp to the switch, thence to the right headlamp, then to the ground.

In other words, in the first case the headlamps are wired in parallel with the battery, whereas in the second case they are wired in series, the switch making the necessary connections. There are a number of possibilities for trouble.

In the first place, remove the left headlight connecting block and turn it one-half a revolution, then put it back again. If this does not remedy your trouble, examine the wire which leads from the switch to the ground or be sure that the switch is grounded perfectly. Next examine the inside of the switch and see that all of the wires are connected and that there is no foreign matter or oil which may short-circuit the inside of the switch to the dim position, then remove the covers and see if the lights function properly. If you are still unable to find the trouble, do as we suggest above and we will let you know immediately.

An Evasive Knock.

2495

From J. A. Moray, Michigan.—I would like a little information about my Ford car. The machine is a 1910 model, rebuilt and largely brought up to date. The cylinder block is about three years old. For a number of years there has been an evasive knock which occurs occasionally. The machine will run miles without a knock, then the knock will occur and go away again shortly.

The knock sounds like the striking of a tack hammer against a heavy piece of iron. Do you think it can be piston slap? I tried to install oversize pistons .0025 larger, but they were too large. Do you think that a standard piston would slap in a cylinder .002 oversize?

Reply.—We doubt very much if the knock is caused by a piston slap. A piston of standard size would not slap in the cylinder .002 oversize, provided the rings are a tight fit in the cylinders. We would advise you to examine the wrist pins, as this is probably where your trouble lies.

After the pistons have been removed from the cylinder make a careful examination of the walls and be sure that there are no grooves or ridges in them. It would be well for you to measure the diameter of the cylinders at a number of points. Be sure that they are not worn "egg-shaped." There is a vague possibility that your trouble is due to excessive compression. The installation of a new cylinder head would remove this trouble.

Removing Radiator Compound.

2496

From Chas. H. Barr, Michigan.—Will you kindly tell me how to remove radiator compound from a Chevrolet radiator? I just purchased a second-hand car and the former owner filled the radiator with sealing compound so that it will not work well; I guess he used too much. I have tried potash lye and water and would like to know if this will damage the radiator.

Reply.—We usually recommend a mixture of potash lye and water for cleaning radiators. One can should be sufficient if mixed with enough water to fill a radiator. Before putting this mixture in the radiator, strain it through a cheesecloth to remove all dirt. Be sure to flush the radiator well after using, for although the potash lye may be harmless, in many cases there is a faint possibility that it will destroy the rubber tubing if left in the radiator.

It is an easy matter to flush the radiator if you start the engine and turn the hose directly into the filler pipe, leaving the drain plug open. Let the engine run about five minutes. If the potash lye does not give satisfaction, mix up one-half pound of washing soda with sufficient water to fill the radiator. Fill the radiator with this solution, after it is strained, and run the engine about ten minutes, so as to circulate it through the whole system, then drain it out and flush the radiator as directed above.

Compression Too High.

2497

From R. C. King, Pennsylvania.—Recently I had new rings fitted in my Chalmers model 35-A car and ever since, when the engine attains a speed of about 25 miles per hour, or when coasting at that speed, there is a knock. What do you think the trouble may be?

Reply.—We assume that the trouble with your Chal-

Digitized by Google

mers car is due to excessive compression. Present-day fuels are much heavier than they were a year ago, and to utilize these heavier fuels an engine should not have such high compression as formerly.

Your engine probably had very high compression, and as time went on wear gradually caused leaks in the cylinders past the rings, thus resulting in lower compression. However, as soon as you fitted new rings to the cylinders you restored the compression to its original pressure and naturally a knock resulted. The remedy for such a knock is the removal of some of the iron at the top of the pistons or in the explosion chamber, or it may be possible to obtain the thicker gasket, which will lift the head slightly. If you can have about 1/16 of an inch of metal burned off the top of each piston, your trouble should be remedied.

However, before doing this it will be best for you to have the compression tested by means of a special instrument called a compressometer, which is arranged somewhat like a steam gauge. The Chalmers people should be able to tell you just what compression is best in that engine.

There is another possibility, and that is a loose flywheel or loose clutch member. In this case the knock would occur when the car is traveling faster than the engine,—in coasting down a hill, for instance. Try to locate the knock. You can do this by means of a stick of wood placed between your teeth, or by means of an old telephone receiver fitted with a stick at the end of it. It is very possible that the knock may be in the transmission system rather than the engine, and if so, look for loose gears or loose clutch members.

Starting Motor Trouble.

2498

From Andrew Burns, New York.—I would like to know what causes trouble in my starting motor on a National car. A number of times the motor has locked in place and when the button was pressed nothing happened. I have managed to release the motor after working the car back and forth. The starter is a Westinghouse.

Reply.—Your trouble may be due to either or both of two things. After tagging the wires remove the motor from the engine. This you can do very easily by removing the motor support and the screws in the flywheel housing. Examine the bendix drive pinion gear and see that it works smoothly upon the worm. Clean it very carefully, then examine the reduction gearing in the motor itself.

It is very possible that some of the gear teeth are broken or that some foreign substance has found its way into the gear box. If the teeth on all gears are in good condition, clean out all of the old grease very carefully and put in new. This will probably eliminate your trouble.

Differential Trouble.

2499

From F. C. Barrios, Louisiana.—We are having trouble with the transmission of a Chandler car. At high speeds there seems to be a loud hum, which ceases when the engine labors. We have recently changed the main roller bearings, but this repair does not make any difference. Do you think the machine has been strained?

Reply.—Your trouble is probably due to the fact that the differential gears, *i. e.*, the pinion and master gears, have been worn badly, resulting in a certain amount of clearance at the teeth, or the removal of the working surface of the gears.

It is possible that you may be able to adjust the gears, but we doubt it.

First adjust the pinion and the master gear so that their backs come together. Screw both adjustments up as tightly as possible, or until the teeth "bottom." Then back the pinion gear away from the master gear 1/64 inch, also back the master gear from the pinion gear an equal distance. Fit some sort of wood handle to the driving shaft or the pinion gear, turning the assembly rapidly by hand. A grinding noise indicates too close an adjustment.

In this case the pinion gear should be backed away from the master gear a small distance, and the master gear also backed away. If there is any other kind in back lash or play in the second gears, adjust them closer together; be careful, however, not to adjust them so closely that the teeth bottom against each other. If there is less motion or play in any case, and this play cannot be compensated, you will be obliged to purchase a pair of new gears. In making any and all adjustments, the pinion gear and the master gear should be moved an equal distance away from each other always and start with the backs of the gears in line.

Rounding Push Rods.

2500

From Rudolph Ahrens, New York.—Mr. H. Cleveland of Kansas, in your February issue, states that noisy tappets can be prevented by rounding off the end of the push rods, but he fails to say which end to round off. Would the valve timing be changed if the head were rounded off?

Reply.—The push rod should be rounded off at the lower end, where it rests upon the cam shaft. It should be rounded in all directions— that is to say, the head should resemble a ball upon the surface; for you must realize that an ordinary mushroom tappet rotates in its place. The valve timing would not be changed.

Leak-Proof Piston Rings.

2501

From E. C. Atwood, Florida.—Some time ago I read a statement to the effect that when installing a leak-proof ring it should be placed in the lowest groove.

Digitized by Google

What do you think of the No-Leak-O oil sealing rings? What is your rule for installing leak-proof rings?

Reply.—You are laboring under a misapprehension in saying that a leak-proof ring should always be placed in the lowest piston ring groove. We hold to the following rules: If an automobile engine is fitted with a splash lubricating system and trouble is experienced in oil leakage into the combustion chamber, a leak-proof ring should be installed in the lowest groove. If, however, oil trouble is not experienced, but there is a leakage of fuel past the rings into the lubricant, then the piston ring should be placed at the top of the piston. As a general rule the former is the case, and that is why we usually suggest that the ring be placed at the bottom. In the older engines, where there is an excessive compression, we always suggest that a full set of rings be used; as a matter of fact, at least two rings should be used upon every piston, if satisfaction is desired.

In every case, you understand, we speak of leak-proof rings. We do not think that with leak-proof rings on the top, oil leakage into the explosion chamber is increased.

If there is still any doubt as to the proper location of the ring, place it at the bottom. In this way the ring will prevent upward-leakage of the oil, it will be protected from excessive compression by the rings above it, it will not be subjugated to the excessive degree of heat, as it would were it at the top; yet it is upon the piston, where it is needed.

We gladly recommend No-Leak-O oil sealing rings The writer has had experience with this particular ring and finds that it compares favorably with other types.

Welding with Electricity.

2502

From J. A. Fay, Louisiana.—We have a 110-volt direct current supply at our disposal and would like to use it for brazing small brass castings, can you give directions for this?

Reply.—There is no way in which you can use your 110-volt direct current generator without changing it or reducing it to the proper voltage by means of a coil. The General Electric Co., of Schenectady, N. Y., manufactures a small shop welding apparatus which can be attached to a line. We might suggest that you write them for details, giving them your source of current voltage and other information.

It is very possible that you may be obliged to install a special set of wires to carry the heavy current.

Removing Carbon Deposits.

2503

From L. E. Child, New York.—I have a model R Schebler carburetor which is heated through a jacket by exhaust gases. The exhaust deposits carbon in these passages, and I would like to know how to clean the jacket.

Reply.—The carbon may be removed by plugging up the lower outlet of the exhaust chamber and filling the chamber with paint remover. Allow the paint remover to remain in the carburetor for about twelve hours. Most of the carbon will be dissolved in the liquid and can be drawn out with a paint remover.

In addition to this be sure to loosen up all carbon possible by the use of a flexible wire.

Kerosene will answer the same purpose to a certain extent, but is far from efficient.

Over-Size Tires and Speedometer.

2504

From W. B. R., Illinois.—I have a Dodge Bros. car which was formerly fitted with 32 by 3½-inch tires, but have put on over-size tires, making them 33 by 4. Can you tell me how much this affects the speedometer?

Reply.—We doubt very much if the accuracy of the speedometer will be affected materially. As a matter of fact the actual difference between the former reading, which was supposedly correct, and the present reading will only be one mile in every thirty-three miles.

In other words, every time you travel thirty-three miles your speedometer will register but thirty-two, or an error of slightly over 3 per cent. The same thing is true about the speed in miles per hour and the percentage error is the same. That is, if you travel thirty-three miles per hour, your speedometer will register but thirty-two. A speedometer, however, is seldom accurate. It is very easy to travel the same ground twice and get a different speedometer reading. You can try it by yourself if you care to, over a measured distance.

Try it first with the car empty and the tires fully inflated, then go over the same distance with a full load and the tires partially deflated. If you look for accuracy, however, you can add .034 to your speedometer readings to get the actual figure. If your speedometer, for instance, registered 200 miles, you would multiply this by .034, giving you 7.8 miles, which added to the 200 would show that you had gone 207.8 miles in all.

Knock in Studebaker.

2505

From A. L. Pollard, California.—There is a distinct knock in my Studebaker car which seems to be in the first cylinder. On starting the knock is evident, then it decreases until a 15 m.p.h. is attained, when it begins again. The knock seems to occur when cutting down the gas or when drifting down an incline.

The connecting rod bearings have all been examined and tightened and the main bearings are all right. I have put in new rings and oil. Retarding the spark does not stop the knock. Can you tell me the trouble?

Reply.—The trouble with the Studebaker car may be in a number of places. In the first place, we should advise you to locate the knock more definitely. You can do this by placing a stick between your teeth and pressing it against various parts of the engine until you have found which cylinder or part of the engine is nearest the knock. We would be inclined to think that the knock

Digitized by Google

is in the flywheel, which may be loose upon the shaft, or else it is possible that the knock is in the clutch mechanism, or the clutch itself, which may be loose upon its mounting.

Examine these units first, then try, if you do not find it, to locate in which cylinder the knock is loudest. If it is not the cylinder and is in the connecting rod, it may be a loose wrist pin or a loose wrist pin bushing.

If it is not, then examine the piston rings and see that there is no end play in them. A loose piston ring will cause a severe knock under certain conditions. While you have the engine pulled down be sure to examine all of the main bearings and the connecting rods again very carefully. Examine the cylinder walls and see that there are no grooves or edges. Be sure that the plug in the top of the cylinder does not extend too far into the cylinder. It is upon this plug that the water manifold studs are mounted.

Overcharging a Battery.

2506

From G. W. Schraeder, Washington.—I have a 1918 Dodge Bros. car and it is fitted with a 12-volt storage battery. If the battery is fully charged when the car is being run, is there any danger of overcharging it? Should I run the battery down once it is charged, and how?

Reply.—It is very evident that you do not use the lights sufficiently. If the battery is fully charged at all times, we should advise you to leave the side lights dimmer, or the tail and dash lights going all night. In this way you will draw upon the storage battery and discharge it to a certain extent.

Don't light all the lights at one time, however; don't light the big headlight bulbs; draw just enough current so as to discharge the battery. Very often a storage battery will not give good results if it is kept charged at all times and gives the most satisfaction if it is partially discharged, at least twice a month.

Difficulty in Starting.

2507

From Olaf Stranne, South Dakota.—I own a Metz car, model 25, and have great difficulty in starting it. I usually have to spin it quite a bit before it will start. It is fitted with a Bosch magneto. If I remove the plugs and place them, connected, upon the cylinders and spin the engine, I do not seem to obtain very much of a spark; at times there will be no spark at all.

The compression is good, the power is excellent and once the engine is started it will run perfectly. Can I use batteries to start upon?

Reply.—Your difficulty in starting is undoubtedly due to trouble in the Bosch magneto. It is very probable that the breaker points are badly worn or poorly adjusted.

The breaker points should be absolutely flat to contact their whole surface when they come together and when the arm is right on top of the cam. The breaker points should separate .025 of an inch. Remove the magneto from the car and make this breaker point adjustment; then whirl the armature by hand, connecting each of the spark plugs with its distributor wire and connect the base of the spark plugs with the base of the magneto. You may be obliged to make a number of breaker-point adjustments until you find the point where the biggest sparks occur.

Clean the magneto thoroughly, pay special attention to the safety spark gap; this spark gap is locked in a little porcelain cut between the magnets.

If the breaker points are badly worn, replace these with new. You cannot use this particular magneto in conjunction with batteries, nor should it be necessary if the magneto is working properly.

What Is Pulsating Current?

2508

From H. M. Wineberg, Pennsylvania.—Will you kindly tell me what the correct designation is of the current flowing in the wires from the coil to the spark plug? Is it Alternating or Pulsating?

What is a clutch brake on a 1915 Overland car? What is it for?

What is the right way to run a car on compression? Is an engine running on compression or on a vacuum when the switch is open, the throttle closed, and the car coasting down hill?

Reply.—In speaking of electric current but two names are used, namely: direct and alternating current. Though the word pulsating is used by a few people, it has no more meaning than intermittent and is not a strictly electric term. The current flowing in the primary wires of any spark coil excited by a battery must be direct; in the case of the Ford system the primary current is alternating. In all cases the secondary current, or the current flowing from the coil to the spark plugs, is high tension alternating.

The clutch brake in a 1915 Overland car is designed to prevent the spinning of the clutch when the clutch is disengaged. The harder the clutch pedal is pressed downward, the harder the clutch cone presses against the clutch brake. It is a device through which the driver can control the speed of the clutch cone and retard the speed of the cone, so as to conform with the speed of the gears, which are being meshed in the transmission gear-set.

To use your terms in answer to your third question: The engine is being run upon compression—that is to say, the compression of the engine is being used as a brake when the throttle is wide open and the switch off. Both the compression and the vacuum of the engine are being used as a brake when the switch is off and the throttle closed.

Four and Six Cylinders.

2509

From M. P. Neighbor, Pennsylvania.—Will you kindly tell me the advantages of six-cylinder engines over fours? Many dealers say that a four-cylinder machine has more power and runs just as easily as a six. If this is true, it is difficult for me to see the advantage of investing more money in a six, since the operating cost of a six must be greater.

Reply.—In our opinion a six-cylinder engine is a better proposition than the four, for the very reason that the power impulses are more evenly distributed. In a four-cylinder engine there are two explosions to every revolution. In the six, however, there are three explosions to every revolution. In the four-cylinder engine there are two dead center points, whereas there are none in the six. In the six-cylinder engine there is a constant overlapping of power impulses, whereas in the four there is a break in the power impulse every half revolution.

We are not willing to agree with you that the operating cost of a six-cylinder car is greater than of a four. As a matter of fact, in comparing two engines of the same horsepower, the six-cylinder machine will give its power at a lower cost than the four. We would call your attention to the mileage records of the Hudson Super Six and the Buick Little Six as compared with four-cylinder engines and even less power than these machines. We might liken the advantage of a six over a four by the following example:

Suppose you were dragging a heavy load over a smooth floor and you applied your power evenly and smoothly. The load would be drawn along the floor with a minimum amount of effort. This power application compares with the application of a six-cylinder engine. Suppose, however, as in the four-cylinder engine, instead of pulling smoothly, you accomplish the result by a series of jerks. The load would slow down and lose momentum and you would be obliged to "yank" it ahead again. The same result would be obtained, but more effort would be necessary.

Firing of Flanders 20.

2510

From P. C. Bradford, Arkansas.—Will you please tell me how to find the firing position of No. 1 piston and the firing order of a Flanders 20? I have tried turning the crankshaft over one revolution after inlet valve begins to open and setting distributor to fire 1-2-4-3, but it will not fire properly. If you have a wiring diagram of this car I would like to have a copy.

Do you think it a good idea to oil the valve stems on a Buick engine?

Reply.—The piston in No. 1 cylinder should be at the top dead center of its stroke, at the firing point, with the spark advanced one notch. We have no record which will show the firing order of this engine, but we will give you directions for finding same:

Remove the spark plugs and turn the engine over until the valve beneath spark plug hole No. 1 has opened and closed. The piston will then be at the bottom of its stroke. Turn the engine over still further, until the piston comes to the top of its stroke. When it reaches the extreme top the spark should occur in the plug. While the piston is rising in the cylinder inspect the intake valve of No. 2 or 3 cylinder. You will notice that the valve in one of these cylinders is just closing and is probably closed when the piston in No. 1 has reached the top of its firing stroke. The cylinder in which the inlet valve has just closed fires next in order.

We have no wiring diagram of this car.

It is a good idea to oil the valve stem on the Buick engine.

Magneto for Jump Spark.

2511

From J. W. Wuerth, Kentucky.—We are rebuilding an old Maxwell car and want to run it on a magneto. We have on hand an old magneto marked "for use with make and break spark only," which was removed from an old stationary engine and was run by a friction pulley from the flywheel.

Do you think it possible to use this machine with an induction coil for jump spark ignition? If not, why not?

Reply.—We see no reason why you cannot use the old magneto for jump spark ignition, providing you can find the coil of the vibrating type which will transform this current to high tension, though it is possible that the current is not of sufficient voltage at all times to excite the coil. Only an experiment will prove this.

We have tried to find just how this old machine is wound, but cannot seem to obtain any data concerning it. When experimenting with it, use any six to nine voltage vibrating coil.

Poor Compression.

2512

From N. Phaneuf, Connecticut.—I have a Liberty Six, 1917 model car and am not satisfied with the power, which is poor, due to poor compression. I have been advised by the agent to install a new leak-proof ring at the top of each piston, but this does not seem to remedy the trouble, it still has poor compression. Do you think that a full set of leak-proof rings would be advisable? If I can only remedy this trouble the car will give complete satisfaction.

Reply.—We would advise you to have a full set of leak-proof rings installed in the engine. Before doing this, however, be sure that the cylinders are absolutely round and have not been worn egg-shaped. We would advise you to have the agent examine the oil level in this car and be sure that the oil pans are not too deep. We would not advise one ring in each cylinder because we do not think that you will secure satisfaction. A full set should be used.

Salvaging an Old Engine

How an Old and Worn-out Engine Was Rescued from the Scrap Heap and Put Into Condition Without Expensive Machine Work

BY W. O. MANN

EVERY once in a while someone who wants a gasoline motor, but either cannot or will not go to the expense of buying one in good condition, is offered the opportunity of acquiring a machine that is "all there," so to speak, so far as its parts are concerned, but is much the worse for wear and tear and looks more like junk than anything else. The price, therefore, will be "away down." Then the question arises, "Can the old mill be put in something like running order without the expenditure of a lot of money?"

Here is the story of the overhauling of such an engine, and the pivotal point is, that a miserable old rattle-box was converted into a good engine at almost no cost, except that of time. In fact, when the job was finished the engine was in some respects better than it was when it was new, though of course there was a certain amount of deterioration that was not to be offset except by rather expensive methods. At any rate, the power was at least fully equal to that of the new engine and the running was perfectly smooth and steady.

An Old "Rattle-Box."

To begin with, there was the engine. It was an obsolete model. The manufacturers had gone out of business years ago, and as the engine was of rather queer, though fairly good design, there was no possibility of obtaining any spare parts. This meant that all the old material must be used or else new parts must be made especially. As this involved a lot of expense it was given no further consideration, and work was commenced with the idea of making the best of things as they were. This worked out all right except in one respect. The piston rings were poor affairs to begin with, and they were not only badly worn and leaking, but they had been made of such inferior material that they had practically no spring.

Merely removing them from the pistons caused them to take a permanent set. As, however, they were of the same size as the rings in a certain very well-known engine, replacing them was a simple matter and involved little expense, though the outlay was much greater than for all the rest of the overhauling put together.

The shop equipment consisted of an ordinary—very ordinary—bench with a carpenter's vise, a little steel vise with two-inch jaws, such hand tools as files, screwdrivers, hammers, chisels, pliers, hack-saws, punches, a hand drill with a maximum capacity of 3/16 inch, soldering materials, melting ladle, calipers, squares—in fact, just the tools that are found in the shop of any amateur mechanic who hasn't much money to spend on his equipment. There was a Bunsen burner, a grindstone, a slab of iron for an anvil, *et cetera*. As it turned out, these common tools were sufficient for the job, strange though it may seem.

Problems turned up from the very beginning—problems that would not have required a moment's thought with a more complete outfit available. The motor was unspeakably smothered in a two-years' accumulation of oil and dust, the removal of which, though only an incident, was a job in itself, but after that, the engine had to be completely taken apart, for the bearings of every sort were so badly worn that it was a wonder the engine ran at all, toward the end of its period of activity.

Taking off the cylinder head, manifolds and other "excrescences" was no trouble; everything was so soaked with oil that nothing was rusted. When it came to the camshaft, however, it proved that one end had a bearing in a blind bushing while the other, which carried the gear, was in a bushing set into a round plate fastened to the crankcase casting with cap-screws.

The cap-screws were covered by the gear, so that the gear had to be removed first of all. It was tightly fitted

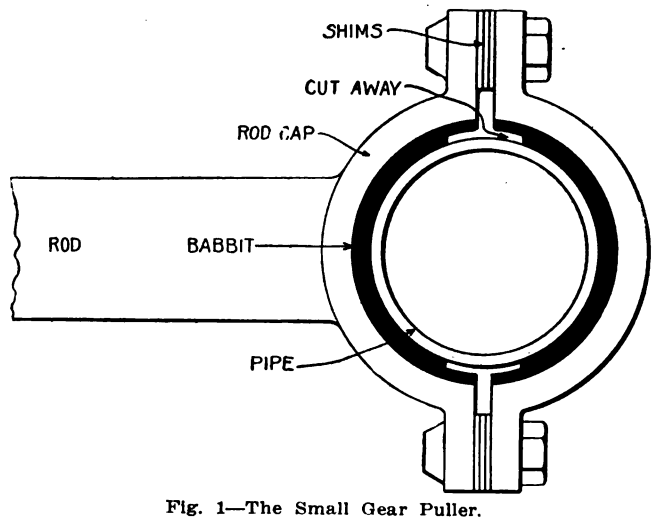

Fig. 1—The Small Gear Puller.

to the shaft and had a taper pin through hub and shaft. The pin was quickly driven out with a punch, but a little cautious tapping and prying showed that considerable force would be needed to pull the gear off its seat. That meant a little gear-puller, and one was made in half an hour.

The Gear Puller.

The yoke was made of a big iron washer, the hole in which was a little smaller than the outside diameter of a ½-inch hexagon nut. The nut was shouldered off with a file until it could be driven tightly into the hole in the washer. Then two slots were cut at diametrically oppo-

Digitized by Google

site points in the edge of the washer, just big enough to take ¼-inch bolts. It would have been just as well, perhaps better, to have drilled for these bolts, but—well, anyway the slots were sawed out and they answered the purpose. A ½-inch bolt with the end filed to an obtuse point was screwed into the nut in the washer and the implement was complete, as shown in Fig. 1.

The gear was webbed, and there were half-inch holes in the webs. The quarter-inch bolts were passed through two opposite holes and washers and nuts put on back of the gear. The heads of the bolts were slipped into the slots in the big washer, the central bolt screwed down until its point entered the center in the camshaft, and a few turns with a wrench brought the gear off without the slightest trouble.

Of course the reduced part of the central nut must be on the under side of the big washer, so that the shoulder can take the pull. Once the gear was off the cap-screws holding the bushing plate were removed and the plate taken out, leaving an opening large enough for the camshaft, cams and all, to pass through.

Then came the crankshaft. The bearing at the flywheel end was a bronze bushing with babbitt lining, fitted tightly into a seat bored in the crankcase casting—which, by the way, was not of the split kind and was integral with the cylinder block. The bearing at the front end, like the camshaft bearing at the same end, was a bushing set into a round plate, but as this plate was quite large the cap-screws holding it were clear of the pinion that meshed with the camshaft gear. By taking out this plate an opening was left large enough for the crankshaft to pass through.

A Tight Flywheel.

Unfortunately, however, this engine was like most engines in having a flywheel on the back end of the shaft, and before the shaft could be pulled through the flywheel had to come off. The wheel was set up on a taper with a Woodruff key and held in place by a nut. The nut came off all right, but at that point proceedings halted, for hammer-blows on the end of the shaft—with a piece of copper to protect the shaft—did not have the slightest effect, and though it is probable that heavy blows would have done the business, such a proceeding is risky because the webs of the shaft may be sprung, or the crankcase casting might be cracked. Here, obviously, was another wheel-puller job—but a comparatively big one. No puller was available, but the old wheel came off just the same. A rooting process in the junk pile brought out a ¾-inch bolt 8 inches long, together with a washer, a piece of ordinary 2 x 4 scantling and a length of flexible wire clothesline. Two pieces of scantling were cut, each six inches longer than the diameter of the flywheel, and they were nailed together to make a piece 4 x 4.

In the middle of the piece, and following the joint, a hole was bored big enough to let the big bolt pass through easily. The end of the bolt was filed to a point, just as was done with the center bolt in the little wheel-puller, and the apparatus was ready for business. One other thing was done. One of the washers of the big bolt was split radially with the hack-saw, from the circumference almost, but not quite, to the hole, and the edges of the split were bent in opposite directions, precisely like the holding points of a lock-washer and—note this—in the same directions.

The bolt was put through the hole in the wood and the doctored washer slipped on, followed by the nut. The wooden yoke was laid across the face of the flywheel and the steel wire clothesline passed around its ends and back of the wheel several times, as tightly as it was possible to pull it. Then the bolt was screwed in until the point rested in the shaft center and the nut bore against the split washer, which had one of its upturned edges forced into the wood, while the other stuck up and held the nut from turning, as shown in Fig. 2.

The Flywheel Came Off.

Then the wrench was applied to the head of the bolt. Gradually the turns of wire tightened, pulled out straight and began to sink into the wood. When the pressure was quite heavy, the head of the bolt was given a good smart rap with a hammer and—well, what actually happened was that the flywheel suddenly left its moorings and fell on the unfortunate mechanic's foot, imparting a limp that lasted the better part of two weeks. But the flywheel came off, which was the main thing, the rest a mere incident.

Of course the valves were taken out, together with their springs and lifters, and the connecting-rods and pistons were also removed, so that the crankshaft made its exit without further delay.

An inspection of the bushings showed that there was a tremendous amount of play in the one at the flywheel end of the crankshaft, a small amount at the other end, and a good deal in both camshaft bushings. The camshaft bushings were plain bronze, the bushing for the flywheel end of the crankshaft bronze with babbitt lining, and the other crankshaft bearing—there were but two—plain bronze.

Starting on a small job first, the play in the camshaft bearings was taken up. The way this was done would make a regular mechanic froth at the mouth—but it worked and has given real results, though there are those who are unkind enough to say that they don't see why it should. The bushing at one end was a blind one—that is, one end was closed. The inside was carefully cleaned with sandpaper—emery sticks in the metal—and treated with soldering flux. Then it was poured full of melted babbitt which was "rubbed into" the surface with a swab of asbestos string wound on the end of a stick.

A Babbitt Bearing Surface.

When the babbitt was poured out a smooth coating was left on the inside. It was found that the coating was very uniform. Its thickness can be controlled to

Digitized by Google

some extent, for the cooler the melted metal becomes before being poured out of the bushing the more will be left behind, and vice versa. After three trials a coating was obtained that just permitted the shaft to be forced in.

This allowed for smoothing down the inequalities of the soft metal and getting a good fit by putting a little coloring matter—red lead or blue mixed with lubricating oil to a thick-cream consistency—on the shaft and forcing it into the bushing, and then working down the spots where the marking showed contact. In this way a good job was actually made of both camshaft bearings and the bushing at the end of the crankshaft opposite the flywheel.

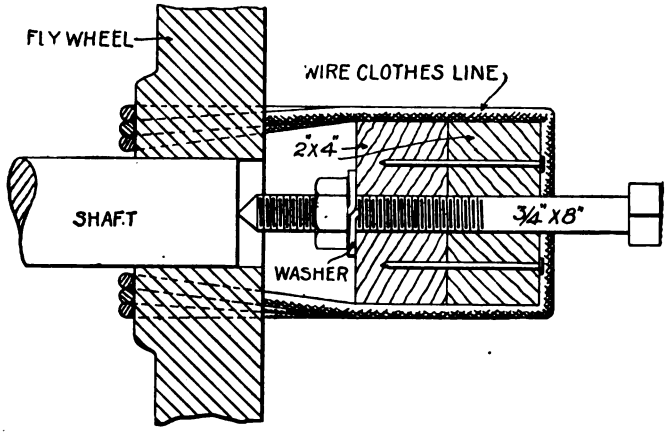

Fig. 2—How the Flywheel Was Removed.

(To Be Continued)

WHY THE CRANKCASE SHOULD BE CLEANED THOROUGHLY

DO you now and then drain the lubricating oil from the crankcase of your engine and put in fresh oil? This is one of the most important details in the efficient operation of your car and should be done at regular intervals. Automobile manufacturers and service stations alike emphasize its importance.

Upon examination of the old oil in the crankcase you will probably find that it has been thinned out in use. Chemical analysis would show a varying proportion of gasoline in the oil, dependent upon the lubricating conditions of your engine and the length of time the oil has been allowed to remain in the crankcase.

Not infrequently upon examination the lubricating efficiency of the oil has been found to be seriously impaired. The principal reason for the increase of this trouble in recent years is the change in the character of the fuel (gasoline) in general use.

Present-day gasoline is of heavier gravity and is less volatile than that formerly sold. It does not as readily saturate the air in carburetion and give as homogeneous or gaseous a mixture as is desirable. The heavier and less volatile the fuel the greater the difficulty of mixing it with air in the correct proportions for combustion. There is, therefore, a greater possibility of fuel in liquid form being drawn into the combustion chambers or cylinders of the engine.

In starting the engine, particularly in cold weather, the use of the carburetor choker valve causes a considerable quantity of liquid fuel to be drawn into the combustion chambers or cylinders. If the cylinder or combustion chamber temperatures are lower than the temperature of the fuel mixture entering, then a partial condensation occurs. Part of the fuel separates from the air as a liquid.

This liquid fuel has a natural tendency to dilute or thin out lubricating oil, with which it comes in contact. As the piston moves up and down within the cylinder, the liquid fuel in contact with the oil film on cylinders, pistons and piston rings, partially cuts away this lubricating oil film.

The compression pressure on the compression stroke aids in forcing the compressed fuel charge down past the piston rings. Then the fuel charge and the liquid fuel mix with the lubricating oil in the crankcase and dilute it.

The amount of fuel which reaches the crankcase and mixes with the lubricating oil depends largely upon the correctness of the lubricating oil used and its ability to form and maintain a thorough piston ring seal, which will prevent the escape of the fuel charge and liquid gasoline past the piston rings into the crankcase.

When the gases or fuel have mixed with the lubricating oil in the crankcase they reduce the lubricating oil in body and considerably decrease its lubricating value. This results in:

1. An inefficient piston ring seal with consequent high consumption of fuel and lubricating oil and loss of power.
2. Premature wear of cylinders, pistons, piston rings and of crankshaft, crankpin and piston pin bearings.
3. Excessive carbon deposits causing pre-ignition and laboring of the engine.
4. Burned out bearings.
5. Poor compression.
6. Excessive accumulation of carbon sediment in crankcase.

To overcome these conditions it is of the utmost importance:

That the carburetor choker valve be used sparingly.

That during the cold weather a means be provided to decrease the circulation of air through the radiator, thereby enabling the engine to operate at a higher temperature.

That the supply of used crankcase oil be frequently drained and replenished with a fresh supply; and

That the correct grade of lubricating oil be used to form and maintain an efficient piston ring seal.

(Written from data supplied by the Vacuum Oil Co., New York, N. Y., manufacturers of Gargoyle Mobiloils.)

The Metal Turning Lathe

Part 2.—Various Types of Tool Post Feeds, The Speeds of the Work for Different Kinds of Metal and Rotation at Various Diameters

BY J. F. SPRINGER

THE power-driven turning lathe in the form known as the engine lathe, when provided with usual accessories, is probably the most useful of all machine tools. It is competent to do not only its own proper work, but also a good deal of work that is ordinarily done on other machines—as for example, drilling holes, grinding, etc.

The modern lathe is driven by a belt-operated cone pulley, by a geared head operated by a plain belt-driven pulley, by the individual electric motor combined with a geared head, etc. The most usual thing in an ordinary small shop is perhaps the cone pulley drive operated by a belt from a corresponding but reversed cone pulley on a counter-shaft.

The object of the various steps on the cone pulleys is to provide for changes of speed of the lathe spindle. When the belt is on the smallest step of the cone pulley mounted on the spindle, it is in shape to obtain the highest spindle speed. As the belt is shifted from one step to any larger step, the rate of spindle rotation is decreased. One of the objects in view in changing the speed of the spindle is to keep the work at the proper cutting speed. This remark will perhaps become clearer after some explanation.

Tool Post Feeds.

The cutting tool is fed to the work in two directions: It is fed longitudinally with the length of the lathe, and it is also fed towards the center of the work in a direction perpendicular to the other feed. The combination of the two feeds determines the rate at which metal is removed.

Consider now a piece of metal held in the jaws of the chuck. Suppose it is purposed to machine the face of this work, beginning on the outer edge and working in towards the center. A suitable combination of longitudinal and transverse feeds is first adopted. The work will pass the nose of the cutting tool at some definite rate of speed—say, 40 feet per minute. This means that the chip is coming off at this rate.

Suppose now both feeds are kept at just the same speed and an unaltered spindle speed is maintained (*i. e.*, its number of turns per minute). When the tool reaches too near the center the chip will be cut off at a very slow rate—nothing like 40 feet per minute. The chip may be cut at only four or six feet in a minute's time.

This is, of course, all wrong, time is being wasted at this extremely slow cutting speed. If 40 feet per minute is right at the beginning, it will be right generally throughout the cut from start to finish.

We could make the chip heavier by increasing either the longitudinal or the transverse feed or both; but this will often be inadvisable. It will be quite easy to do something else. That is to increase the rate at which the spindle turns. What we want to do then is to speed up the spindle from time to time with the view of maintaining the cutting of the chip at the rate of 40 feet per minute. Consequently, we begin work with the belt on the big end of the cone pulley, and, as we work in towards the center in making our cut, we shift the belt from step to step. When we get down to the smallest pulley, we will have the most rapid rotation of the spindle possible.

Various Cutting Rates.

We have been talking about 40 feet per minute as a rate at which the chip came off. As a matter of fact, there are various rates of cutting speed. They differ with different steels. With modern high speed tool steel as the cutting tool, we can use rather high rates. With the usual carbon tool steel, a more moderate rate is best.

For a good average cutting steel, 40 feet per minute is a fair rate, when cutting low or medium carbon steel. If we have to cut high carbon steel, we may adopt a somewhat slower speed or else reduce the size of the chip.

It's a very good idea to find out whether we are running our lathe right—that is, whether we are using the proper speed, considering the kind of metal in the work and the kind of metal in the tool. We may be running much more slowly than we need to run. But, how are we going to find out the rate at which the chip is coming off? It is very easy to say that it should peel off at the rate of 40 feet or 50 feet per minute. But, how are we going to find out?

Well, there are two or three ways. The easiest way is to make use of a special instrument called a *cut meter*. We hold it against the work and readily determine the speed in feet per minute at which the work is moving, at the point of contact with the instrument. We haven't anything much to do except hold on to the instrument and read off the number of feet. We use a watch or a clock to give the length of time.

Using the Cut-Meter.

The calculation will be a simple one. If the instrument has a rubber-tired, small wheel, which is to be held against the rotating work whose diameter is such that the circumference is just four inches, then all we have to do is to divide by three the number of turns indicated on the dial during one minute. We shall have at once the number of feet per minute. One turn gives us four inches—that is, 1/3 foot. If we have 130 turns shown by the dial in the course of one minute, then we

Digitized by Google

have 130 x 1/3 as the total distance covered in one minute. That is, we get at once 43 1/3 feet for the one minute's work.

There is another way of getting at the speed at which the chip comes off. This method calls for a little calculation. We first find out the spindle speed. How this is done was explained in our former article. We then have the number of turns per minute made by the work. We next measure the diameter of the cut we are making. By multiplying this diameter by 3 1/7 we will obtain the length of the chip taken in one turn. Suppose we measure the diameter and find it to be 3½ inches. Multiplying by 3 1/7, we obtain 11 inches. That is, every time the work makes a complete circuit, we take off 11 inches of chip. Suppose now that the spindle was going at the rate of 46 turns per minute. Then the total length of chip in one minute would be 46 times 11 inches. This is 506 inches, or slightly over 42 feet.

Speeds for Special Work.

Now 46 turns of the spindle per minute is a pretty slow speed. Our arrangements with the line shaft, counter-shaft and cone pulleys may or may not be right to take care of this speed. Sometimes very slow speeds are gotten by using back gearing on the head-stock of the lathe. But we should not need to resort to the back gears in order to handle an ordinary cut of 3½ inches diameter. We should be able to take care of it with the belting arrangements, using the big end of the cone pulley.

If, for any work that has to be done, especially if there is a good deal of it, it should be necessary to make special arrangements for a slow spindle, we may put a small pulley on the line shaft and a big one on the counter-shaft. This may seem cheaper than buying a lathe fitted with back gears.

GLITTERING CARS.

By WALT MASON.

Some poet wrote, in days of old, "All things that glitter are not gold." The poet's head was large and long, his intellect was working strong. There were no flies upon that bard, who sprang the truth, and sprang it hard.

All things that glitter are not gold; we wouldn't be so often told, if haply we'd remember that, and post the maxim in our hat. The junk that fakers want to sell will often look surpassing well, but when it's used it comes to pass that shining gold is only brass.

I bought two diamonds long ago; they cost me eighty bones a throw. I held them proudly in my hand, and there they shone to beat the band. I bought them from a stranger slick, who found in me a trusting hick. I swallowed all his helpful bunk, and handed him my bottom plunk. And in a month the stones were dead; no gorgeous radiance they shed. The man who bilked me was a peach; those gems were worth just eight cents each.

The poet said, "Oh, boys, behold! All things that glitter are not gold!"

The man who goes to buy a car down where the blithesome agents are, should keep the maxim in his mind; it isn't safe to go it blind. Some shining paint and nickel plate will make a tinhorn boat look great. The buyer, take it as a rule, is quite an easy man to fool. He knows no more about a boat than Uncle Ezra's billy-goat. He doesn't know or want to know what makes the dog-gone inside go; but he would like a fool-proof car, in which a man may journey far without it coming all apart and rupturing the owner's heart.

He ought to buy a car that's made by men of standing in the trade. Have they been in the business long, and are their fame and credit strong?

He should remember that the Haynes was first to hit our native plains, and all the time it's kept abreast of everything that's first and best. That is the safest guarantee for easy marks like you and me.

The poet said, "Our feet grow cold, for all that glitters is not gold."

THE WHY OF A LUBRICANT.

There Are a Number of Old Superstitions About Cylinder Oil Which Should Be Dispelled

THERE is a mistaken idea among motorists that the best cylinder oil will not carbonize, and one of the tests that many car owners make is to place a drop of lubricating oil upon a hot plate. If the oil evaporates and leaves no residue, they consider it a good lubricant.

There is another class of motorists who believe that the oil when placed upon a hot plate should not evaporate at all. There is still another class of motorists who think that they can judge a good lubricant by the "feel" of it. That is, they place a drop between their thumb and index finger and see whether it is slippery or not. If it is not, they immediately condemn the oil as being poor.

Of all these tests, the last one is perhaps the best, but who of us is capable of judging oil by its "feel?" The average motorist can judge an oil only by the results obtained, not by any ordinary test that he may make.

There are many stringent requirements which must be met in a gasoline engine before the lubricant may be considered perfect. In the first place, one must thoroughly understand that any oil to contain lubricating qualities must contain carbon. Necessarily then, it will carbonize in the cylinders under intense heat.

The heat in the combustion chamber at the time of explosion is above that required to melt iron. At that temperature any lubricant will be evaporated to a certain extent, then it must leave a residue.

There is one large oil company whose chief argument is that their lubricating oil does carbonize, though its point of carbonization is extremely high. Under ordinary engine heats, a good lubricant will not carbonize rapidly, then if it does, the rate will be so slow that the carbon will be driven off through the exhaust.

The specific gravity of an oil cannot be used as a

Digitized by Google

basis of judgment. It is only the combination of all its qualities that determines a good lubricating oil, and it is safe to say that an oil marketed by a reliable concern for a particular purpose will give satisfaction providing it is used for the purpose for which it was intended.

This is true of automobile lubricants. If the car owner is satisfied with the results he is obtaining from a certain kind of oil, he should never change to another. The best oil is not the cheapest, though the cheapest oil may sometimes give as good results as that costing more. Therefore, never use the price as an index of quality.

If you do not obtain satisfaction from a medium or light grade of cylinder oil, do not think that your trouble will be remedied by using a heavy grade in every case. The fault may lie in the oil, not the grade. Experiment with various oils until you have found the one which gives the most satisfaction. Then stick to it. Further change is entirely unnecessary.

NEW AND INTERESTING THINGS IN MOTORDOM

A New Correspondence School.

A short time ago we announced the discontinuance of the technical school of New York, a school which was founded originally by the carriage makers of the country to train young men along the lines of body makers and designers.

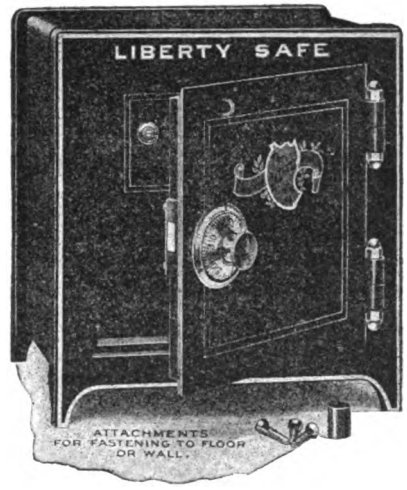
The principal of this school, Mr. Andrew F. Johnson, has founded a correspondence school at Gray, Maine. In this school pupils will be trained to design both automobile and carriage bodies and a complete course in mechanical drafting as well as a course in free-hand drawing is given.

Mr. Johnson for twenty-six years has been a practical designer of bodies and is considered an expert in his line. His course is very complete and practical and the principles taught have formed the basis of the success of many men who are now prominent in the body part of the automobile industry.

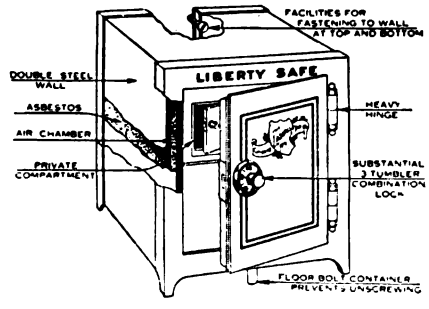
Upon completion of the course certificates of graduation are furnished to those who pass the examination successfully. The students are kept informed just how they stand at all times. At the present time there is a great dearth of automobile body designers and any young man who contemplates entering a trade should consider the possibilities held open for him in this line of work. Full details concerning the correspondence course may be obtained by writing Mr. Andrew F. Johnson, Gray, Me.

Lazco Spring Lubricators.

Motorists are beginning to realize that there are automobiles giving 100% more satisfaction and ride much easier if the springs are kept lubricated.



Many motorists who heretofore have used shock absorbers, find that with the springs lubricated a machine rides as easily without the shock absorbers, as it did before the springs were lubricated, with the shock absorbers, and when the shock absorbers are applied, the machine gives as much satisfaction as a high priced car.



The Lazco Spring Lubricators are designed in such a way that they may be attached to practically any width of spring. They provide an oil reservoir on each side and an automatic wick feed which supplies the springs with oil at all times. The price is low and motorists who are interested in an easy riding car should write the Lazarus Mfg. Co., 750 Prospect Avenue, Cleveland, Ohio, for further particulars.

Lazco Liberty Safe.

The Lazarus Manufacturing Co., of Cleveland, Ohio, have placed on the market an all-metal home safe. The manufacturers state it is fire and burglar proof, can be bolted to the floor or side wall and a protection every home should have.

This safe should prove an ideal protection for thrift stamps and liberty bonds, and as their literature states, bonds are negotiable and if stolen can be spent the same as money, if destroyed by fire, cannot be replaced.

SECTIONAL VIEW SHOWING SUBSTANTIAL CONSTRUCTION

The Liberty Safe.

Westinghouse Marine Expansion.

So imperative have become the demands for marine electrical propelling equipments, especially for Emergency Fleet Corporation, that the new Essington plant of South Philadelphia, of the Westinghouse Electric & Manufacturing Company, has been placed in operation for the exclusive promotion of this type of equipment.

At the Essington Works is produced the complete propelling equipment for merchant vessels. This equipment consists of practically every part between the boiler plant and the propeller of the vessel. At the present time there are 350 complete equipments on order or under construction.

The significance of these orders can better be appreciated when it is considered that they include steam turbines, reduction gears, condensers, condenser pumps, small turbine generator equipment for lighting, stern tubes, propeller shafting and propeller shaft bearings.

The largest equipment is 12,000 shaft horsepower, and none are less than 1,500 shaft horsepower. The equipment manufactured by this company has been tried out upon many oil tankers, freight and passenger ships and other vessels now actively engaged in trans-Atlantic service.

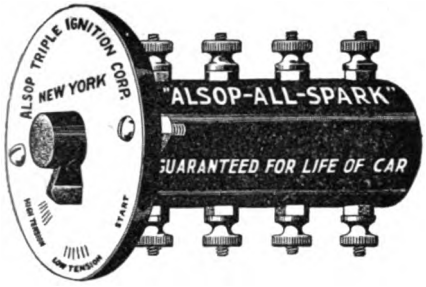
Amazon Rubber Company Takes Over O'Neil Tire Accessory Business.

A recent development of considerable interest in the tire world is the purchase of the tire accessory business of the O'Neil Tire & Rubber Company by the Amazon Rubber Company of Akron.

In discussing the matter, L. J. Schott, general manager of the Amazon Rubber Company, stated:

"Mr. W. J. O'Neil is one of the pioneer manufacturers in his field and for over ten years has produced a high-grade line of tire accessories which have enjoyed a nation-wide distribution and have been decidedly popular with every dealer in the country.

"The purchase includes the exclusive right to the name "O'Neil" as an accessory trade name, all unfilled orders on hand, and the good will of their trade.



"We realize that there will now be a crying need for dependable tire accessories which will enable the car owner to secure every possible mile of service from his tires. on account of the decreased production and the necessity of conserving the rubber supply of the country.

"We will conduct this new addition to our business on a much broader scale, and under the name of "O'Neil Pioneer Accessories" will place before the trade the highest quality reliners, wing blowout patches, lace-on boots, cementless patches, etc."

Alsop-All-Spark.

In the last issue of this magazine we gave a short description of the Alsop-All-Spark Ignition System, but failed to give the manufacturer's name. This device is manufactured by the Alsop Triple Ignition

Alsop-All-Spark Ignition Device.

Corporation, 1765 Broadway, New York City, and seems to be entirely different from anything else ever placed upon the market.

The device is so arranged that, for starting the car, the high tension current used is of practically the same voltage and amperage as furnished by the original set of coils. As the engine warms up or as carbon is deposited on the plugs, the knob of the Alsop-All-Spark unit can be turned and the voltage raised greatly. With the increase in voltage, the spark action is increased greatly, and the writer has personally seen a sooted spark plug resume action as soon as the Alsop dial was turned to the high tension position.

Should the electrodes become short circuited by a drop of oil or gasoline, the spark will leap between them just as if the oil or gasoline were not present.

An interesting test was made recently by officers from the War Department at Washington when a Ford car with ordinary equipment was filled with lubricating oil above the average height. The engine was run until all the plugs short circuited and it would operate no longer. The Alsop-All-Spark system was then installed on it and the engine started.

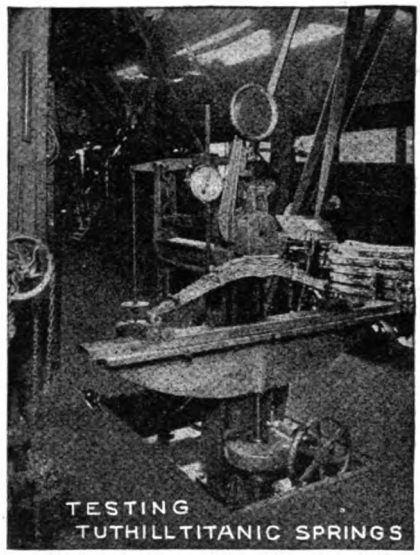
Within a very few minutes the engine was running evenly and despite the fact that considerable more oil was added, it still continued to operate smoothly, and at the end of six hours the plugs were removed and found to be practically clean, despite the excessive lubrication.

Auto Top and Covers.

If "a man is known by the clothes which he wears," an automobile is judged by its top. Doubtless many of our readers consider the purchasing of a new top or new seat covers for their machines this fall, and we would advise them to write to Messrs. Buob & Scheu, 286-298 Webster Street, Cincinnati, Ohio, for their catalog and prices at which they will make tops for practically any model of car.

This concern manufactures the tops, fitting them to forms and ship them to the user ready to apply to the frame, so that practically anyone can put the top upon their car themselves, thus saving considerable money. In writing for prices be sure to give the name and model of your car.

Help Win the War.



"Every pound of steel, scrap or otherwise, conserved will Help Win the War."

This is the new slogan of the Tuthill Spring Company, makers of Tuthill Titanic Springs. This company is co-operating with the War Industries Board to the last degree, and not only are they conserving steel in their own factories, but they are urging every one of the distributors and dealers to co-operate. Bulletins are being sent out and advertisements in all the automobile trade papers are asking distributors and dealers to do their part.

"It is little short of treason," says Mr. D. S. Campbell, secretary of the company, "to use one pound of steel for other than essential purposes. We must do our part; we must use every precaution in the distribution of automotive springs for repair and replacement. That is the way we can Help Win The War. The government needs steel. And every pound that is used for non-essential purposes is delaying the victory of the Allies, is giving Germany aid."

"Every distributor, every dealer has a real part to play. And when this enormous army of automobile men are really co-operating, when every ounce of steel is going into cars that are either directly or indirectly helping in government work, then we can know that we are speeding victory.

"We are doing everything in our power

to conserve. And we know that every distributor and dealer is going to do everything in his power to conserve."

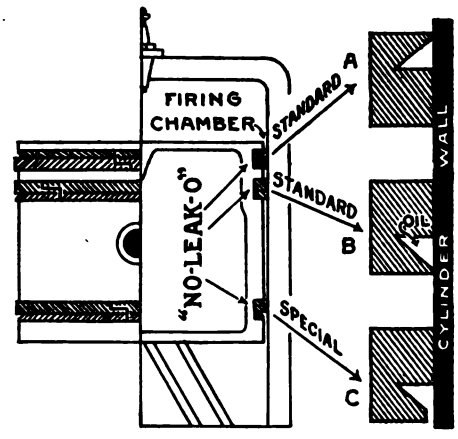
Alamo Light Plant.

Never before in the history of the country has there been such a call for crops and live stock. Consequently it may be assumed that the farmer is perhaps the greatest factor in the war. He is the man that furnishes our country with the necessary provisions and is perhaps the man who has the most money to spend today.

It is easy to see, however, that the farmer's increased income will not last long unless he can obtain the necessary farm labor. The farmer appreciates this and is doing all in his power to obtain machinery with which he can replace manual labor.

The Alamo Farm Light Company of Omaha, Nebraska, manufacture a lighting equipment as well as electric generating apparatus which should be of great interest to the farmers throughout the country. The farmers, with their increased incomes, are looking for home comforts, which they have not had heretofore. Consequently they are equipping their buildings with electrical machinery and their houses with lights.

Every reader of this magazine who lives in a farm community should investigate the Alamo Farm Light Plant. If he is a dealer, an interesting proposition is held open to him. If he is not a dealer, the proposition is fully as interesting because it opens for him another source of income providing he cares to take an agency. A post card or the coupon clipped from this magazine will bring you full information concerning the lighting plant.



Witte Engine Works.

The Witte Engine Works of Kansas City, Mo., have recently added another large section to their factory which covers approximately 10,000 feet of floor space. This addition will be used solely for the erection of portable engines and saw-rigs which are now in great demand because of the call for wood, both for manufacturing purposes and for fuel.

The Witte Engine Works claim to be the largest exclusive kerosene and gasoline engine factory in the world which sells its product directly to the user. The factory was established in 1870 and has been continuously under the management of Ed H Witte, president and principal owner since 1884. Doubtless many of our readers desire to obtain a stationary engine which will operate upon either gasoline or kerosene and if so we should advise them to write this corporation for their catalog.

No-Leak-O Piston Rings.

The autoist probably realizes by this time that due to the low grade of fuel he is constantly troubled by the leakage of fuel into the base of his engine past the rings and the subsequent dilution of the oil. Ordinary piston rings do not prevent this leakage which often results in great damage to the cylinders and the engine, to repair which frequently costs many dollars also. There is a special type of ring called No-Leak-O oil cylinder piston ring which is unique and very practical. This ring is of the special type, and around the lower edge is cut a patented oil cylinder groove. In operation low-grade fuel is prevented from passing the ring by the square edge on the ring. After the explosion or when the piston starts down, carbon and dirt are carried out of the groove by capillary action into the firing chamber. The kerosene is thus vaporized and other foreign matter ejected with the axle hand into the oil pit. The groove at the bottom of the ring is at

Application of No-Leak-O Pison Rings.

all times filled with oil making a perfect combustion tight seal at all times.

Further details may be had by applying to the Automobile Accessories Co., 824 W. North Ave., Baltimore, Md.

Third Annual Convention.

The third annual convention of the National Association of Purchasing Agents will be held at Detroit, September 23, 24 and 25. The convention headquarters will be at the Hotel Pontchartrain.

While a suitable amount of entertainment and diversion are included in the arrangements, the gathering will be primarily a war convention. The topics assigned for discussion deal largely with the part which industrial purchasing agents may take in serving the interests of the country at this time.

Attendance at the convention is not limited to members of the association, an open invitation having been extended to purchasing agents in all industries and in all sections of the country. Representation from every state in the union is assured, and the gathering promises to be one of vital importance not only to purchasing agents but to all business organizations.

The headquarters of the association are at 25 Beaver Street, New York City, Secretary L. F. Boffey being in charge.

"We Are Having Excellent Success With the Sale of Dixon's Automobile Lubricants."

So write the Coeur d'Alene Hardware & Foundry Co., Wallace, Idaho, and it is with pleasure we reproduce below the balance of the letter.

April 17, 1918.

"We take pleasure in announcing that we are having excellent success with the sale of "Graphite Products" as manufactured by the Joseph Dixon Crucible Company, Jersey City, N. J., and especially the sale of Graphite Greases for Automobiles.

"Last year was the second year that we handled this commodity, and since our sales were four times what they were during the first year, and as we have sold as much this year already as we did during the entire year of 1917, we are thoroughly convinced that this product has an exceptional merit, for the reason that all of our preferred customers are specifying. the Dixon Greases and do not hesitate to advise us that it is the best product which they have ever used for this purpose."

That other dealers have had the same success is borne out by letters received from them and which will be published from time to time.

"We Are All Enlisted Men."

"We are all enlisted men, members of a single army, of many parts and many tasks, but commanded by a single obligation, our faces set toward a single object."

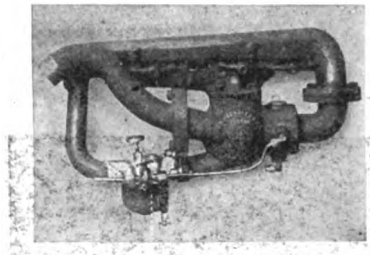
From the President's Labor Day Proclamation.

Not since the dawn of history, when tribe fought tribe, has a war so called on the entire forces, industrial, economic and spiritual, of a people. Co-ordination and co-operation to the utmost are needed if german menace is to be overcome.

Not merely every man of fighting age, but every man and woman and child has a place in this Drama of the Ages. Some of us bear arms; those of us who remain behind, and who are safe because they are on the battle line, owe them our duty of loyalty and service. Without these they cannot fight; without these there can be no victory of Right over Wrong. The vast supplies of the tools of war must be provided by us, by our labor and our money. "We are all enlisted men, commanded by a single obligation."

The Fourth Liberty Loan is here. It is a bugle call!

BUY LIBERTY BONDS!



Olsen Vaporizer.

Every automobile owner realizes that at the present time he must save gasoline. This fuel is necessary for our aeroplanes and high-power engines used by our armies abroad.

At home, however, there is a substitute which is 50 per cent cheaper and equally powerful. We speak of kerosene. It is true that this fuel does not vaporize as readily as does gasoline. It is not always possible to start an automobile engine on kerosene unless it has been heated.

Kerosene is a cheaper fuel, which at the present time may be considered as a by-product of gasoline. There seems to be plenty of it and this fuel is used exclusively in England for driving automobiles.

To utilize kerosene or other heavy fuels, a special form of vaporizer is necessary

The Olsen Vaporizer Applied.

and such a vaporizer is manufactured by the United States Vaporizer Co., 213 State Street, Boston, Mass., and known as the Olsen Kerosene Vaporizer. At the present time this device is manufactured particularly for Ford cars. The manufacturers claim that when the Olsen vaporizer is used, the engine delivers as much power as though it were consuming gasoline.

They also claim that more mileage is obtained per gallon of fuel, that the flexibility of the engine is increased and that carbon, the one bugaboo of motorists, is not deposited upon the pistons or in the cylinders.

So great is the manufacturers' faith in the Olsen vaporizer that he is willing to send the vaporizer to any motorist for thirty days free upon receipt of the price. At the end of thirty days, if the owner does not feel that the vaporizer is giving satisfaction, he can return it and get his money back. An especially interesting proposition is offered to dealers. Kerosene is undoubtedly the fuel that will be used in the near future and dealers who enter the field at this time are bound to have many sales in kerosene vaporizers.

See-Safe Windshield Wiper.

No automobile driver likes to drive his car in the rain or fog, particularly if his car is equipped with a windshield, for the very reason that the moisture deposits upon the glass and renders it practically opaque.

Very frequently the motorist is obliged to drop his windshield and drive without it in order to see the road ahead, thus inconveniencing himself and the passengers with him. This procedure is entirely unnecessary if the motorist will equip his machine with a See-Safe windshield wiper, a device which clamps over the top of the windshield and wipes the glass for a distance of ten or twelve inches. The contact is made through a length of squeegee tubing.

As soon as moisture deposits upon the windshield the windshield wiper is moved across the shield. The squeegee tubing wipes off all of the moisture, leaving a clear opening through which the driver can see the road ahead. The inside of the device is fitted with a roller so that it may be moved with a minimum amount of effort. It is so arranged that it may be pivoted at the top or moved straight across the shield. Motorists interested in this device should write the Stadeker Metal Specialty Co., 358 West Madison Avenue, Chicago, Ill.

War Savings Stamps.

War Savings Stamps may not be considered especially as a thing new and interested in motordom, at the same time, however, there is a new and interesting idea which may be considered in connection with War Savings Stamps.

Many of the dry good stores as well as drug stores and other retail interests throughout the country make a practice of requesting their patrons to take a portion of their change in thrift stamps. Why would it not be a good idea to offer these stamps as a sort of a bonus given with certain accessories, while Thrift Stamps could be used with cheaper purchases?

Of course the patron could be charged slightly more for the article in question. At any rate the dealers throughout the country could make a practice of popularizing both War Savings and Thrift Stamps.

Geo. D. Bailey Co. Build New Factory.

A little over a year ago the George D. Bailey Co. was organized for the purpose of marketing the Bailey Ball Thrust bearing for Fords and Chevrolet 490 cars. This ball bearing was to replace the flat thrust washers that take the gear thrust at the left side of the differential and which, because of their flat surface, produce friction and wear thin, causing gears to unmesh.

The company, after having perfected their ball thrust bearing which, containing steel balls, was frictionless, and thereby permitted no wear, proceeded to market it through the regular dealer channels in a conservative manner, feeling that the market was present for such a bearing. A greater demand soon made itself evident and that there was a popular demand for a bearing of this type is evidenced by the fact that in just one year's time the Bailey Company has been forced to move from their previously small quarters and build their own modern factory.

The new plant, located at 4500-4506 Ravenswood avenue, Chicago, is equipped with $75,000 worth of the latest type of machinery for manufacturing not only the Bailey Ball Thrust, but their new product, the R C Magneto Coupling for trucks, tractors and passenger cars, and is so arranged as to enable the company to turn out its products economically on the highest efficiency basis as well as placing it in a position to manufacture other products the company has in mind.

Not a little of the success of the rapid growth of the Bailey Company can be attributed to Mr. C. F. Ferguson, vice-president and general manager, whose intimate knowledge of merchandising methods has enabled him to inaugurate as a selling policy for the Bailey Ball Thrust one that has proved to date a most satisfactory one to dealers throughout the United States and Canada. Judicious advertising also has played a large part in the success of this manufacturer.

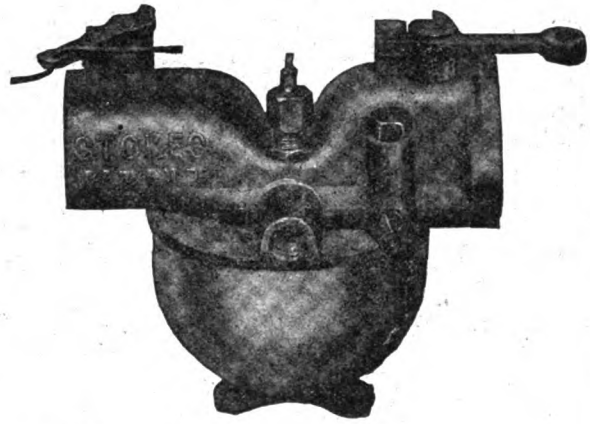
HELLO BILL! Shake!

Remember that tip you gave me in August about the

STOKES CARBURETOR

"Well, I thought it was pretty strong talk; but sent for six, and got jobber's proposition on my county anyway.

"Put one on my car, and *say!* I never was so surprised and enthused over any auto accessory in all my life!



"Two of my good customers wanted to know what got into me. I told them to go drive my car around a while and up their pet hill and see for themselves. Same thing happened to them. All bubbling over with the same exclamations! 'Makes my car run as smooth, quiet and responsive as a steamer!' 'Certainly makes starting a real pleasure.' And, 'doesn't that quick get away' and that 'pep' and 'power' give you some satisfaction though.

"And they go on ma ve ing about its combined efficiency and simplicity, including the adjustment.

"And its economy feature paying a big dividend on their investment, etc.

"The first lot of six were sold within 3 days. And it's just as you say, Bill, it makes friends for you, who spontaneously talk, and boost, and unconsciously sell it for you.

"Shucks! I see space won't allow me to tell you now, but wait until next month and you hear all about my first experience in tackling the jobber's proposition. That's the real big reason why I am even more enthusiastic than you said I'd be. And I do want to thank you for the best tip ever given me. See you next month, Bill—so long."

Auto Repair Men and Garage Owners

Bill's and Joe's experiences are really true and typical of the average Repair man and Garage owner who u. dertakes our dealer's and jobber's propositions.

The Carburetor not only sells itself, giving you liberal commission, but it makes friends for you whose other repair work you get.

It increases the mileage per gallon of gas over other carburetors on the average fully 35%.

And it is making the guaranteeing of a 25% increase over other carburetors really a safe proposition for the company.

It so markedly surpasses all other makes on the 5 vital points:—Easy Starting; Flexibility; Power; Simplicity; Economy—that it is becoming known everywhere, as "THE LEADING CARBURETOR."

Has no moving parts to give trouble from wear or coagulation.

Put on for a 15 days' trial, it never fails to add a new booster to its rapidly growing list.

The price is $15.00. If a purchaser is not entirely satisfied after 15 days' trial the purchase price will be refunded.

Write for full particulars today. Mail coupon herewith attached and we will give the order our prompt attention.

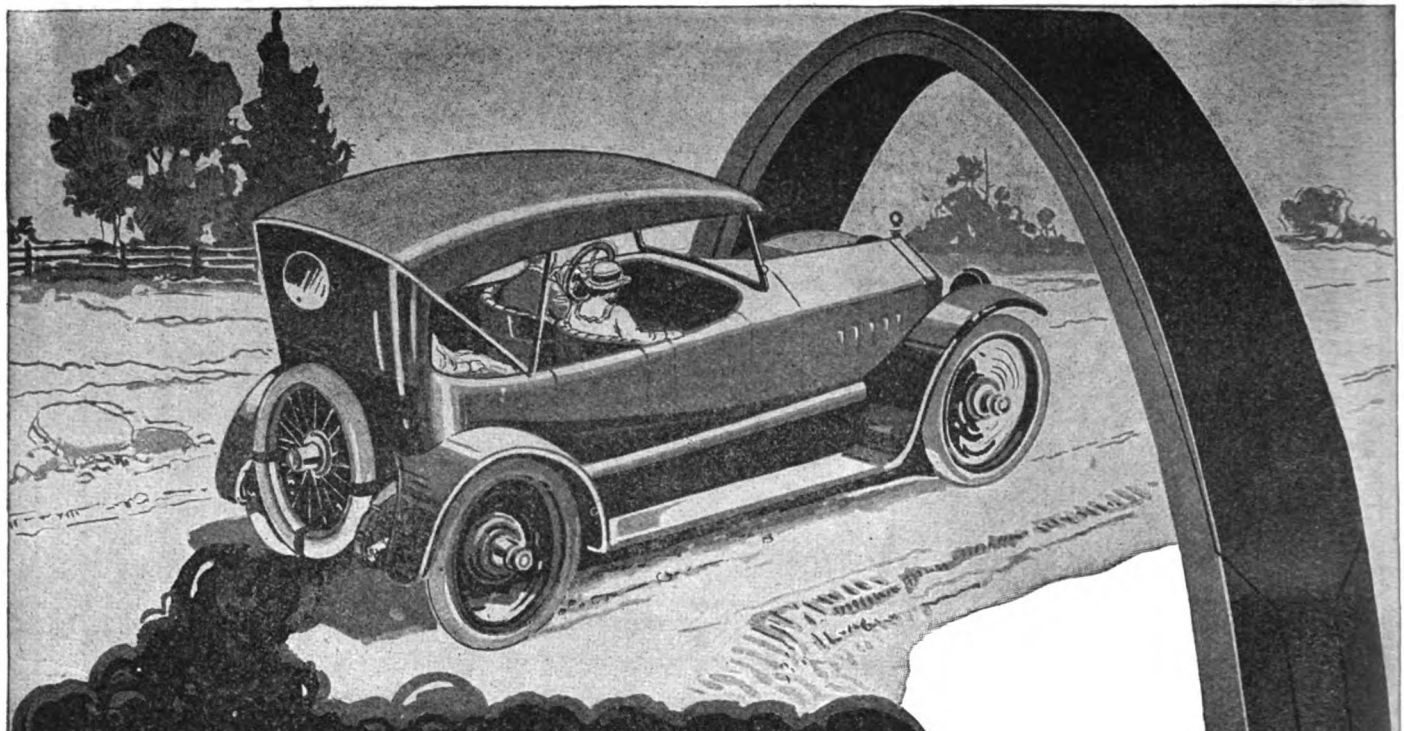
The Stokes Carburetor Co., Inc.

781 East 142nd Street, New York City

(Kindly attach this coupon to your Repair Shop or Garage order head)

STOKES CARBURETOR CO., INC.

COUPON



Please send me one carburetor C. O. D., with full directions for trial. Price $15.00 —less dealers' discount. It is understood that if within 15 days I find it not satisfactory and as represented that I can return it and you will refund my money.

A SURE SIGN of carbon is a smoky exhaust, due to lubrication getting *past* the piston rings up into the combustion chambers where it *burns*. Leaky piston rings waste as high as 25% gasoline —one drop in four.

HI-COMP PISTON RING

"THE RING THAT MAKES THE MOTOR SING"

are the best gas-tight rings for overcoming engine troubles due to carbon—knocking, skipping, faulty ignition; valve pitting, wearing down of cylinder walls, piston and piston rings; smoky exhausts.

Hi-Comp Piston Rings are made from two perfectly balanced perfect eccentric rings into one absolutely gas-tight concentric ring. Each ring ground under oil — not buffetted — to preserve the true temper of the secret process gray iron and ensure high polish and gas-tight fit. Won't wear cylinders out of round — *proof* of gas-tightness. Make reboring of average cylinders unnecessary — an exclusive Hi-Comp advantage. Hi-Comp Piston Rings deliver every ounce of power from every drop of gasoline on to the piston head — no power or oil can get past them!

It will pay you to install Hi-Comp because of the satisfaction they give to you and your customers. Fully guaranteed by an old established piston ring company to give MORE POWER on less gasoline and oil. Write for booklet, specification chart and details of 90-day trial guarantee

Triple-Heating the Gas.

Getting every ounce of energy out of the fuel is the aim of every truck engineer, driver and operator in these days, when ounces count. Various devices have been tried for reducing fuel consumption and eliminating waste, and one inventor has gone so far as to compound a chemical which he claims will increase fuel mileage when added to the gasoline in the tank. Few of these devices, however, have met with as great success as the motors which superheat their gas before it passes into the combustion chamber.

On the Fulton Motor Truck, the gas is heated three times before it reaches the intake valve. In the first place, the air is heated by passing through a stove before it enters the carburetor. This stove is kept hot by the exhaust pipe to which it is attached. The air, thus heated, passes into the carburetor and serves further to vaporize the globules of gasoline which have been broken up in the spray.

This gas mixture is then conducted through a cylinder block channel between the hot cylinders to the opposite side of the motor. In this second heating the gasoline is still further vaporized. Any particles of fuel that may yet remain unmixed with the air are dashed against the hot spot of an exhaust contact manifold, and thus vaporized in a third heating. When the gas goes into the cylinder it is a thorough and highly combustible mixture.

The result is power and the greatest possible efficiency in the consumption of fuel. There is no waste gasoline and particles of kerosene or other low grades of fuel are not deposited in the cylinder. Careful tests show that the Fulton with a 1½-ton load will consistently give twelve to fourteen miles on a gallon of gasoline.

William Fulton Melhuish, president of the Fulton organization, has long been known in the manufacture and operation of motor trucks for his conservatism and strict adherence to usual time-tested practice and it was only after years of road demonstration that he would permit the Fulton engineers to standardize on this "triple-heated" gas feature which has proved so uniformly successful in Fulton operating economy.

Woodworth Lubricating Spring Cover.

The Woodworth Lubricating Spring Cover is a leather covering for automobile springs which completely encloses them. It has a lining of felt wicking which is saturated with oil before the covers are put on and will retain oil enough to lubricate the springs for a year or more. The Covers are made for all cars and can be easily fitted even by an inexperienced person.

These Covers not only provide perfect lubrication for the springs but they keep out all moisture and dirt and keep in the oil so that the outside does not become greasy and messy.

Proper lubrication of the springs makes the car ride easy, eliminates squeaks, prevents broken leaves and makes the springs so sensitive that they absorb shocks and vibrations, relieving the tires and machinery of a great deal of strain, greatly prolonging their life.

The Woodworth Lubricating Spring Cover is held on the springs by small straps which buckle underneath, thus there is no strain on the outer covering and consequently the covers last almost indefinitely.

A circular giving full information regarding the covers will be sent free to anyone writing to the manufacturers, the Woodworth Manufacturing Corporation, Niagara Falls, N. Y.

Those Requiring the Very Best in

CYLINDER GRINDING

fitting with light grey iron pistons, leakless rings, hardened and ground pins, our work has no comparison with the ordinary, now obsolete heavy type pistons and rough boring jobs. We grind our cylinders to one-half thousandths, mirror finish. We grind our pistons on the highest grade machines to fit, two and one-half thousandths clearance. We use the McCadden leakless piston rings. Work all reassembled ready for installation. All work positively guaranteed.

Patterns and castings in stock for every make of motor.

CYLINDER GRINDING on automatic machinery by skilled mechanics at prices that will interest you. Gears, axles, valves and parts of all kinds made of high grade alloy steel. Send us your worn or broken parts and we will replace them. Oxy-Acetylene Welding. Cracked cylinders a specialty. Adapt Machinery Co., 1632 So. Wabash Ave., Chicago, Ill.

The Cell Beam Lamp.

The Cell Beam Manufacturing Co., 1101 Bedford Avenue, Brooklyn, New York, announce that they have changed their policy and now sell from factory to jobber. They have also made a number of improvements in their Cell Beam lamp. Generally speaking, the cell beam is at present more substantially constructed and less liable to damage than formerly. The body of the lamp has been strengthened, the focus adjustment has been improved and the handle fully nickel plated instead of polished as formerly.

This lamp is provided with a thick front lens and eight feet of cord instead of five feet as before. One of the greatest improvements is an etched frosting on the 30 c.p. nitrogen bulb, instead of a coating as formerly. Jobbers are requested to write the factory for full details and special proposition.

RAJAH

Shipments Are Delayed

Shipments of Rajah Plugs are considerably delayed owing to heavy government requirements placed with the Rajah factory.

In some sections of the country Rajah Plugs are almost unobtainable. *Don't let this happen to you.*

We strongly urge you to place your orders now, anticipating your requirements as far ahead as possible to insure your having stock on hand.

Rajah Terminals and Adapters

are furnished so that Rajah Plugs can be used with any car.

Rajah Regular and Ferrule Clip Terminals

Adjustable to any cable and with ferrule to fit any cable. With the extra collar supplied both can be used with any make of plug.

Rajah Thumb Nut and Stud Terminals

The Thumb nut is an adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six and Pullman. The Stud for Buick, Chevrolet and Oldsmobile.

Rajah Ball Terminal

Adapter for Franklin, Locomobile and Willys-Knight.

Manufactured by

Rajah Auto-Supply Co.

Bloomfield, N. J.

Sales Department

Edward A. Cassidy Co., Inc.

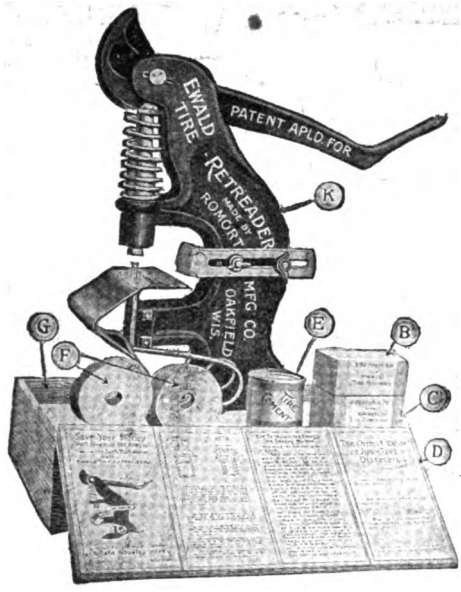
280 Madison Ave., New York

The Government asks car owners to save gasoline

The car owner knows that a leak in his ignition is as wasteful as a leak in his gasoline tank.

Sell the Rajah—the plug that conserves gas. Its quick, hot, brilliant spark unfailingly ignites every atom of the mixture. Its gas-tight construction and special heat-resisting porcelain permit no power leakage. Every ounce of energy is delivered behind the pistons.

In racing cars, airplanes and speed boats, where the gas engine is put to its severest test, Rajah Plugs are daily demonstrating this exceptional service.



Note: To give your customers 100 per cent efficiency see that they install a complete set of Rajahs.

Rajah Terminals are furnished so that Rajah Plugs can be used on any make of car.

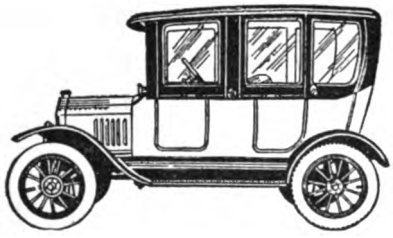
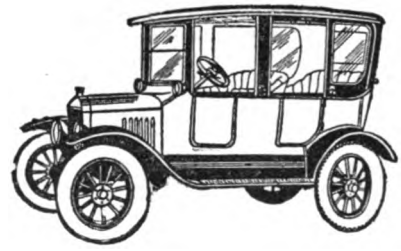
DETROIT DETACHABLE WEATHERPROOF TOP

Is Absolutely Rattle-Proof and Will Last as Long as the Car



It is the only patented all-weather top that does away with the objectionable features of a detachable top and affords the car owner an enclosed or open body for year-round use at a really low price.

Just as the convertible sedan is now used twelve months in the year, so the Detroit Weatherproof Sedan Top is used in the warm as well as in the cold months.



A Detroit Weatherproof Top is cool in Summer—warm in Winter. Windows in doors are made of a transparent, flexible material, slip up into the deck, leaving the car entirely open when desired.

In case of wind, rain or storms, the windows can be tightly closed, just as quickly and easily as you pull down the curtains in your home.

Storm Tight—Wind Proof—Dust Repellent

A SPLENDID OPPORTUNITY FOR DEALERS

Thousands of passenger car owners buy Detroit Weatherproof Sedan Tops. Do you realize the tremendous advantage held by the motor car dealer who sells Detroit Weatherproof Tops, with all these live-wire motor car prospects, who may want a new car next year, or right now, coming to his salesroom floor to buy Sedan Tops? What a list of ripe motor car prospects a Detroit Weatherproof Top dealer can obtain in this way.

And every prospect made a personal friend through the sale of a Detroit Weatherproof Top,—nearly every such prospect a probable purchaser of a motor car this year or next!

Contracts Are Being Signed for Another Season

Detroit Weatherproof Dealers are so satisfied with the ease with which these sedan tops sell, that they seldom allow any condition to arise which will interrupt the continuation of their prosperous relationship with the Detroit Weatherproof Body Company.

Still, changes occur here as they do in every business and there are also localities in which the rapid growth of our business generally has kept us from securing representation.

Perhaps the Detroit Weatherproof Top is still unrepresented in your section, or perhaps you think you can improve our representation in your territory.

In any case, we will be glad to hear from you.

DETROIT WEATHERPROOF BODY COMPANY

Saginaw Street, Pontiac, Michigan

SUNDERMAN
Vacuum Carburetor

Model F **$6**

For Ford, Metz and Saxon Four

F. O. B. Newburgh, N. Y.

Model BB—for all other cars—without connection **$8**

With regular connection **$10**

With Special connection **$12**

Let This Carburetor Pay Your War Taxes

You Will Serve the Government at the Same Time

THE Sunderman Carburetor saves from 30 to 50% of gasoline on any car. If the Government taxes gasoline at 2 cents per gallon, that will equal about 8%. Our carburetor saves 30% at the minimum.

Figure it out: If you use 10 gallons on a trip now, with a Sunderman carburetor you will use no more than 7. Ten gallons at 25 cents, plus 2 cents war tax, cost $2.70. Seven gallons at the same price and tax cost $1.89—*a clear saving on one trip of 81 cents*—as a minimum—and you have rendered the Government double service—you have paid your tax and saved gasoline. You may buy War Savings Stamps with the money you save.

If the Government taxes you on the basis of the price of your car, the savings in gasoline cost made by a Sunderman Carburetor will pay the tax for you and leave a substantial remainder. And still you'll be serving the country—you can "carry on," do your duty and preserve your personal efficiency through recreation and the proper use of your car for business or semi-business purposes.

Your Paramount Duty Today

Whether you are a manufacturer, a jobber, a dealer, a garage or repair man, or an owner of a motor truck, your duty to your Government and the industry that supports you is plain:

You must co-operate with every measure decided upon to help along the efficient conduct of the war.

You must conserve the use of *fuel* and raw materials.

You must do business up to the patriotic maximum—for in that way only can you serve your country best.

You must devise ways and means to *save* and to *serve* so that the great automobile industry shall not only *live*—it must *thrive*. Whether the men at Washington fully appreciate it or not, the automotive industry's development in America is the *chief*—we had almost said the *only*—factor that will make possible the certain victory to which America's millions have pledged themselves.

Your Course Is Plain

No matter what branch of the business claims your interest, you must begin to *serve through saving*

Any plan or instrument that saves you or your customers money enables you to take care of new tax demands and still leaves you free to serve further.

We offer the Sunderman Carburetor on this basis. *Our business has increased remarkably this year for just this reason.*

It saves from 30 to 50% of gasoline—thousands of car owners are proving that statement. Many do even better. At the same time it gives *more power*, greater flexibility, faster pick-up, quicker getaway, better hill-climbing, more economical idling and helps to prevent carbon.

Your opportunity is plain—Order a Sunderman Carburetor at once

Dealers—Can't you see the handwriting on the wall? Write for our proposition at once.

There is one army more powerful than all the cannon on earth! It is behind the counters of the retail stores of this country.

Are you in command of part of it, you owner, manager or director of a retail business? You certainly are and you must launch it against the Powers of Evil now intent upon the destruction of everything worth your while as a business man.

SELL WAR SAVINGS STAMPS

Money will win this war and nothing else will. Valor without equipment is of no avail. Strategy without strength is of no avail. Money loaned our Government will assure them all for our armies — ships, guns, munitions, food, clothing, medicine, hospitals.

Give the order. Your salespeople will do the rest. They are fighters every one. They couldn't be soldiers in the greatest army in the world if they were not—the army of retail salespeople.

The Clark Electric-Steam Vulcanizer is Built for the Garage Man Who Wants Tire and Tube Repair Profits.

This outfit puts you in the vulcanizing business immediately—at lowest cost. No boiler to fire—no danger—simply hitch to your electric light socket. No current used when not working. Can be placed anywhere.

Absolute pressure control – cannot overcure. Handles all ordinary repairs to tubes and tires. Requires no watching. Endorsed by 17 leading tire manufacturers.

Vulcanizing work costs nothing to get. It pays big profits. The rising cost and scarcity of tires and the elimination of sizes has trebled the repair business.

Don't delay. Get the facts. The low price and big range of work of the Clark Vulcanizer will astonish you. Write at once—let us tell you how to get a machine quickly and make Vulcanizing the most profitable part of your business. Act now.

STREATOR, - - - - ILLINOIS

The B & D Portable Drill

**CONCEDED TO BE THE SAFEST—
THE STEADIEST DRILL IN EXISTENCE.**

Compact in size and powerful in construction—Stands up to work which demands severe continuous service.

THE CONTROL IS LIKE THAT OF AN AUTOMATIC PISTOL—one finger does the work without affecting the steadiness of the aim or the firmness of support of the tool. No taking hand off grip to turn switch or press button. Your finger merely pulls the trigger and cuts off the current.

Prevents the breakage of drills which now means a genuine saving owing to the uncertainty of deliveries.

Universal motor (any current), ball thrust bearings, chrome vanadium steel gears, forced draft cooling system.

Men praise the B & D Portable because they work better with it. Fully Guaranteed.

Write for full description.

USE THIS → AND PREVENT THIS

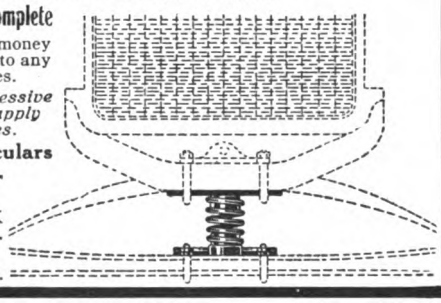
FOR - - - $6.50

Can Be Installed in Less Than 20 Minutes by the Average Layman.

PLUNKETT SHOCK ABSORBERS

"A Shock Absorber and Rebound Snubber in One"

When the car is standing still, the shock absorber is in a normal position; therefore, when the car starts it takes the slightest action or greatest concussion. On the rebound motion of the car, as soon as shock absorber spring reaches its normal position, it starts to stretch or pull, thereby positively eliminating the extensive rebound which is so common on Ford cars. Can be installed without changing or altering any of the Ford parts or taking away any of the natural action of the Ford spring



Price $6.50 each, complete

On receipt of check or money order, will ship prepaid to any part of the United States.

For Sale by all Progressive Dealers, Jobbers, Supply Stores and Garages.

Brooklyn, N. Y.

Easy to Use— Easy to Sell

Every buyer of a SHALER 5-Minute Vulcanizer becomes a booster! Every motorist who buys one shows it to his friends—gives them a demonstration—because it is such a wonderful thing.

This means big sales for you. As soon as you start selling the SHALER 5-Minute Vulcanizer, your customers will spread the news. You will quickly notice new faces in your store—new customers passing their money across your counters.

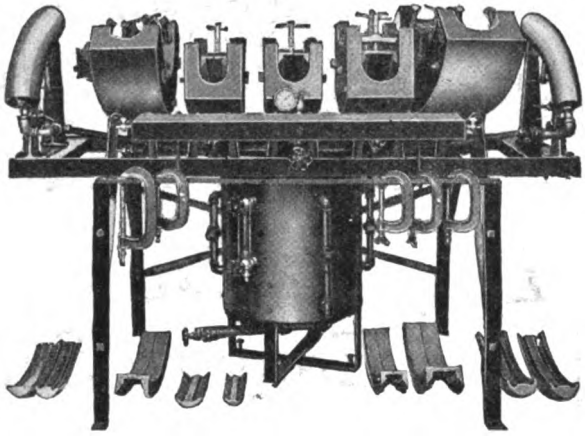
Complete Outfit $1.50
Including 12 Patch & Heat Units

The six round and six oblong patches and combustible discs that go with the vulcanizer are soon used up—and the motorist comes back to you for more. He pays you 75 cents for every dozen of these units. You make a good profit.

Can you realize what a big repeat business this means for you? Can't you see how it will bring car owners into your place for additional "ammunition"—who will also buy other goods? And that is what you need to build up your business!

Place Your Order with Your Jobber NOW

Don't delay! The enormous demand for SHALER 5-Minute Vulanizers has exceeded our factory capacity to make deliveries. We are building a large 3-story addition to our plant. But—to make sure of prompt shipments—place your order with your jobber now specifying date of shipment desired.



Complete Catalog of full line of SHALER Vulcanizers for Motorists, Garages and Repair Shops Mailed on Request.

Do As We Say and Make Big Money

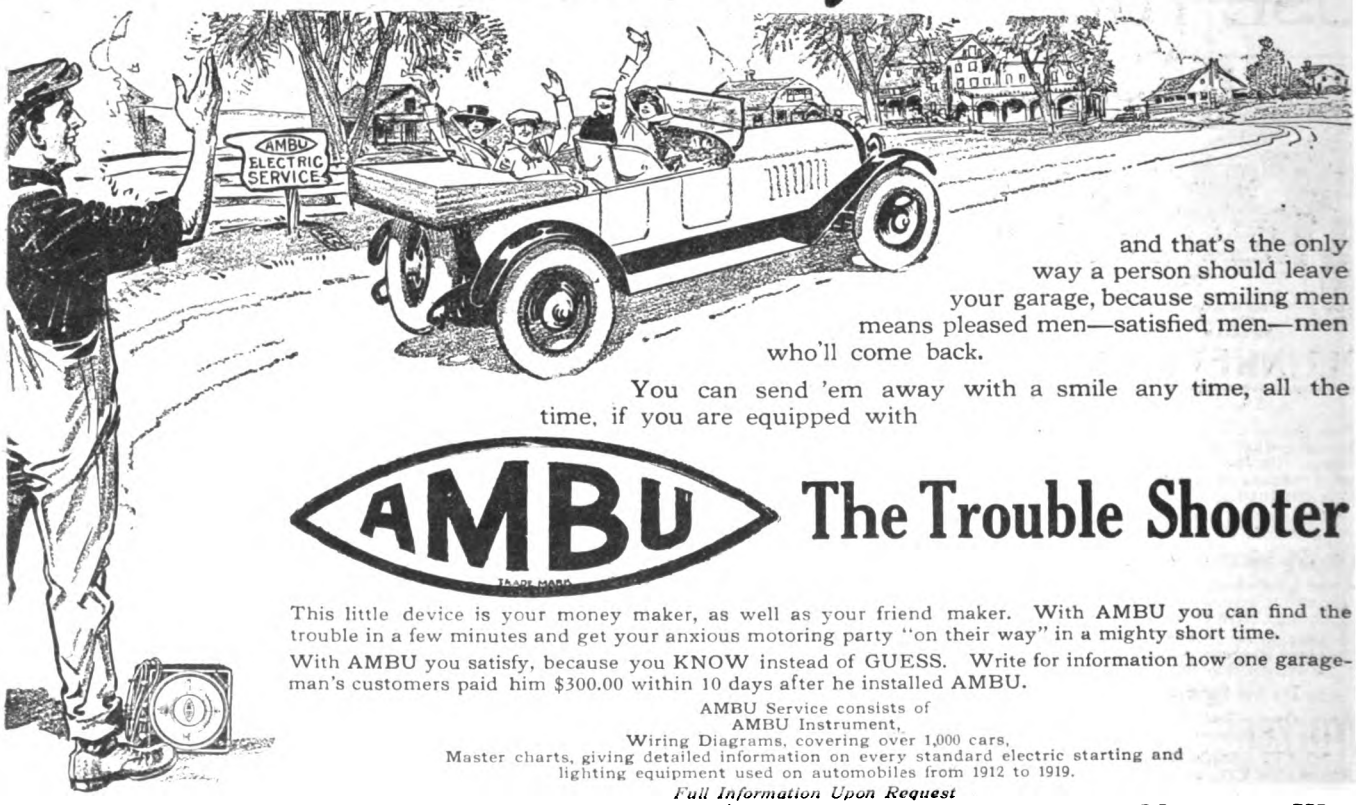
Open a Tire Repairing Shop

All the work you can do. Big profits on every job. We give instructions, sell you complete equipment and tell you how to start.

We show you everything; send you names of men formerly working for small pay, now doing flourishing business. Tire Factories say we have the only vulcanizer that operates upon **correct** principle—that repairs tires exactly as they were made.

VANDERPOOL VULCANIZER

Now used by veteran tire repairers after trying all other makes.



Cheapest to operate. **Pays for Itself.** 5 Cavity Model does $100 worth of work a day. (Smaller 2 and 3 cavity sizes also.) Millions of tires now in use and need constant repairing. You cannot fail.

Write us at once for **Tire Repairing Manual** and full particulars. Biggest money-making business now open to you. Write today.

In Answering, Address Dept. F

Wm. Vanderpool Company - - - Springfield, Ohio

You Can Send 'Em Away with a Smile

and that's the only way a person should leave your garage, because smiling men means pleased men—satisfied men—men who'll come back.

You can send 'em away with a smile any time, all the time, if you are equipped with

AMBU The Trouble Shooter

TRADE MARK

This little device is your money maker, as well as your friend maker. With AMBU you can find the trouble in a few minutes and get your anxious motoring party "on their way" in a mighty short time.

With AMBU you satisfy, because you KNOW instead of GUESS. Write for information how one garageman's customers paid him $300.00 within 10 days after he installed AMBU.

AMBU Service consists of
AMBU Instrument,
Wiring Diagrams, covering over 1,000 cars,
Master charts, giving detailed information on every standard electric starting and lighting equipment used on automobiles from 1912 to 1919.

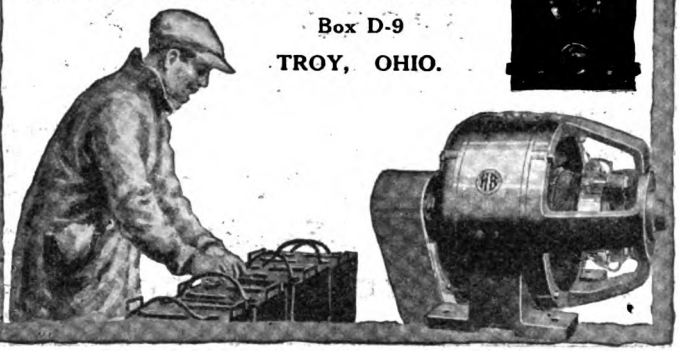
MAKE YOUR OWN ELECTRIC LIGHT

And Make Big Profits At The Same Time Charging Auto Storage Batteries With The

HB LIGHTING AND BATTERY CHARGING OUTFIT

Hundreds of garages where electric current is not available are using this money-making equipment. Operates from line shaft or engine, giving ample capacity for brilliant lights at low cost and recharging from one to six 6-volt auto storage batteries at one time. Income 75c to $1.50 per battery, with average cost of only 12c to 15c.



$18.50 Puts this Money-Making Outfit in your Garage

Balance in 10 monthly payments of $12.00 each. Write for full information, or send cash payment with trial order. Under absolute money-back guarantee, you run no risk.

We furnish also electrically operated equipment. Write for information.

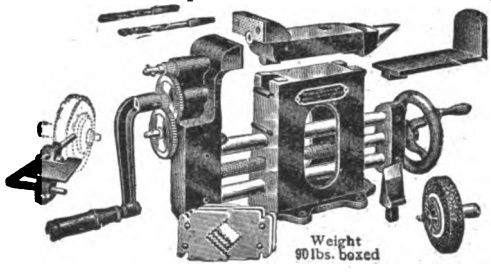
HOBART BROTHERS COMPANY
Box D-9
TROY, OHIO.

$25 Worth
of tools for $16.00

SENT ON APPROVAL FOR $2, BALANCE PAID ON ARRIVAL IF OUTFIT SATISFIES

Here's a complete repair outfit—arranged in about the most convenient manner you can imagine. Everything you need—everything in its place—and every tool of good dependable quality.

The Stewart Handy Worker is a wonderful combination of tools (six in one). Outfit includes strong practical anvil; powerful vise up to 4¼ inches; a sure-grip steel pipe vise; corundum grinding wheel, 5 inches by 1 inch; a two-speed drill press, with 2 drills; a metal cutting wedge and driving mechanism of three speeds—direct, 4 to 1 and 16 to 1—easily regulated by changing handle grip. It operates grinding wheel, buffing wheel and many other similar tools. All for $16.



Every Private Garage Should Have One.
Every Public Garage Needs at *Least* One.

Accept our approval offer—send $2 with order, pay balance on arrival. If not satisfactory in every way, return and money will be refunded.

Descriptive Booklet Mailed on Request

Stewart Handy Worker

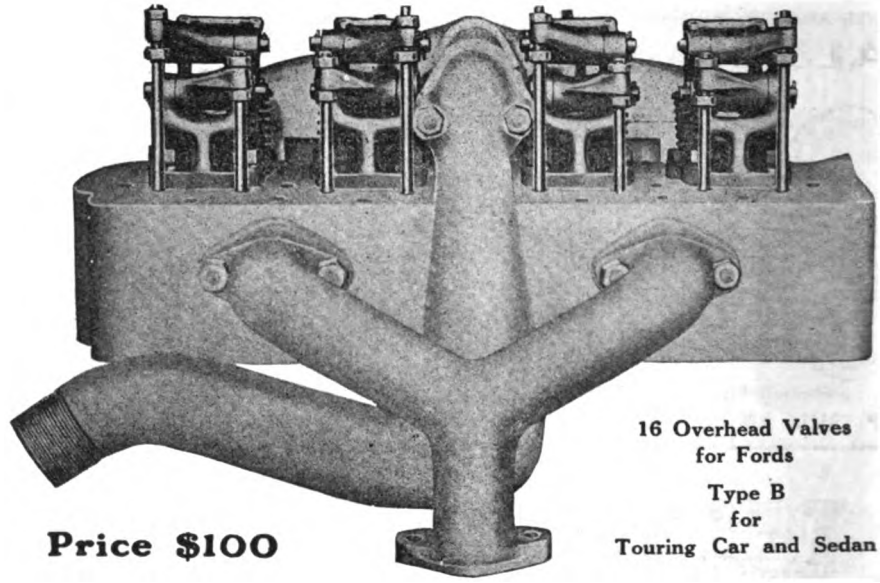
Weight 90 lbs. boxed

Here is the practical, successful working-out of the idea of a Liquid Carbon Remover—with its vast economies to car owners and sales opportunities for the trade.

The great saving in gasoline by keeping cylinders carbon-free; the great economy of the Carbon Remover over the boring-out method; the great advantage of cleaning cylinders without laying up the car—**all are realized** with this

WONDER WORKER

article. The Wonder-Worker Carbon Remover gets results in **30 minutes**—without the slightest injury to the motor. It loosens the carbon from the metal—so that it's **blown out** through the exhaust.



Let WONDER-WORKER Carbon Remover prove to you how the Wonder-Worker Specialties actually deliver results that have only been claims in the past. Descriptions and prices of complete line in catalogue; copy should be in your hands.

Have You Had Trouble With Your Tires?

The fault is not with the tires. You, or your chauffeur, or both, are to blame. The responsibility is yours because you should keep the tires pumped up to a specified pressure, and don't.

Tires that are kept up to the proper air pressure last twice as long—sometimes ten times longer—than tires that are run with not enough air in them. Measure your air daily with a

SCHRADER UNIVERSAL TIRE PRESSURE GAUGE

and get out of your tires all the miles they can give.

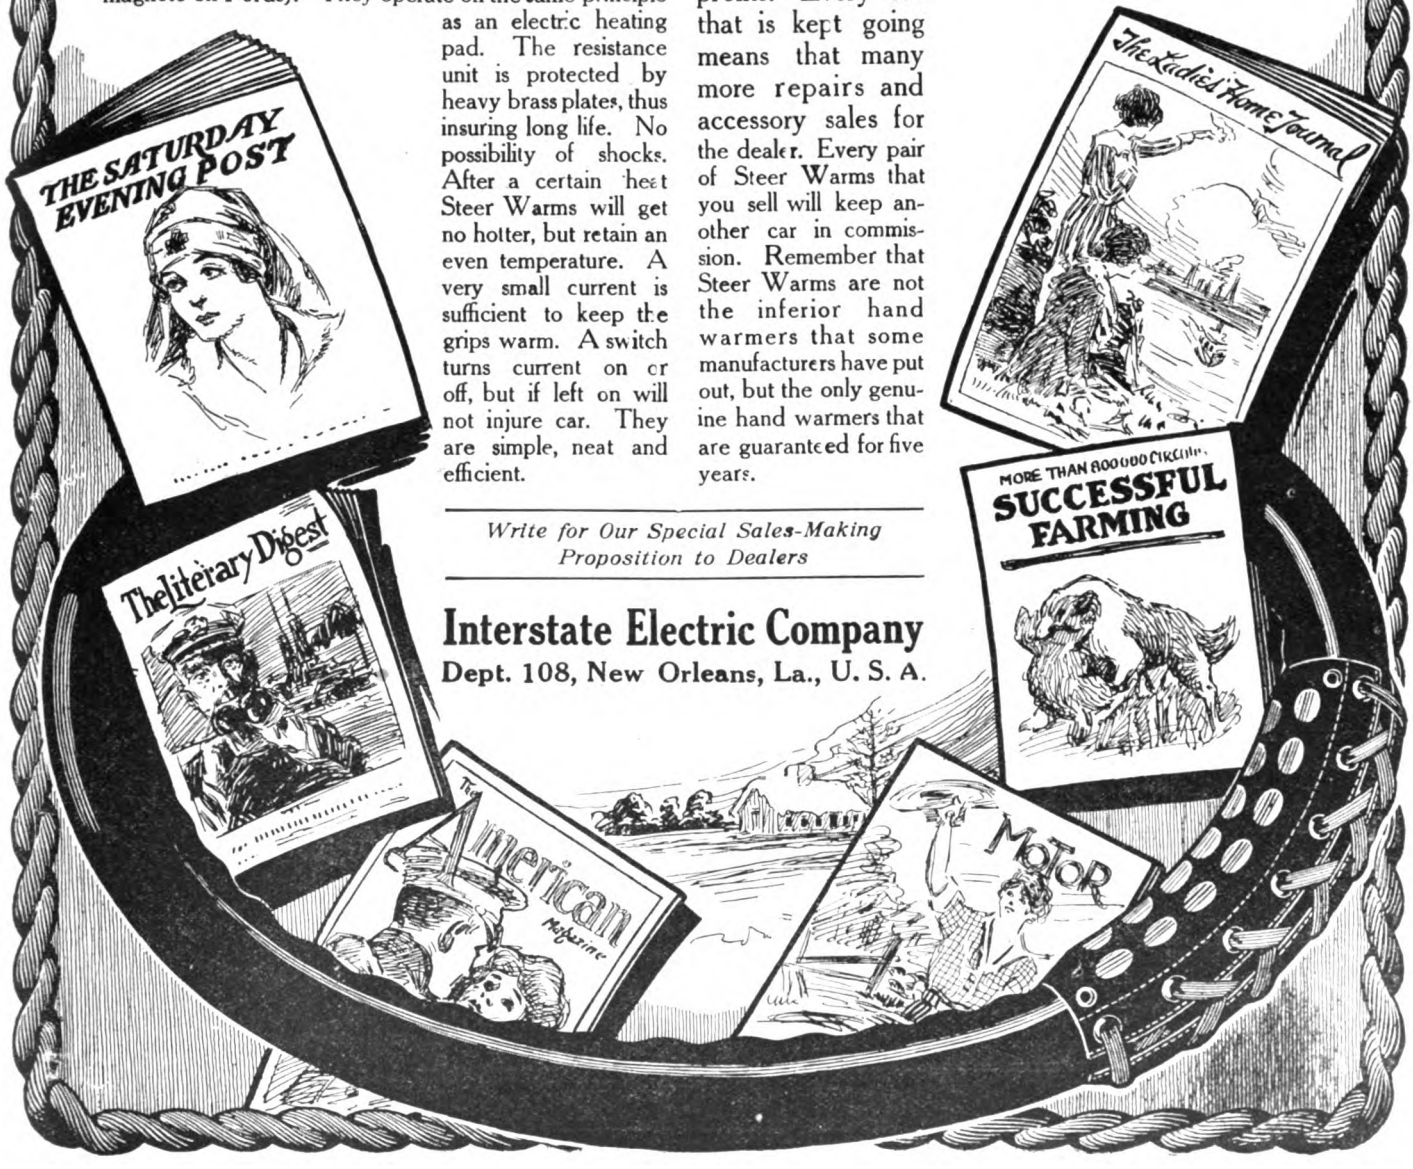
Among The Best Advertised Accessories

Many accessories are well advertised, but there are not many that have the advertising that Steer Warms are going to have this Winter. We are taking large space in the Saturday Evening Post, Literary Digest, American, Ladies' Home Journal, Successful Farming, Motor, and many smaller publications.



Steer Warms

The Electric Hand Warmer That is Guaranteed

DESCRIPTION

Steer Warms consist of two neat leather-covered grips, one for each hand, which lace onto the steering wheel at any place convenient for driving. Steer Warms are heated by electricity from the storage batteries (or magneto on Fords). They operate on the same principle as an electric heating pad. The resistance unit is protected by heavy brass plates, thus insuring long life. No possibility of shocks. After a certain heat Steer Warms will get no hotter, but retain an even temperature. A very small current is sufficient to keep the grips warm. A switch turns current on or off, but if left on will not injure car. They are simple, neat and efficient.

will be advertised to millions of people, and our ads will reach practically all the five million car owners of the United States. Dealers should tie up with this advertising in order to increase their winter profits. Every car that is kept going means that many more repairs and accessory sales for the dealer. Every pair of Steer Warms that you sell will keep another car in commission. Remember that Steer Warms are not the inferior hand warmers that some manufacturers have put out, but the only genuine hand warmers that are guaranteed for five years.

You can know what each truck earns-

GUARDING your interests unfalteringly, the Jones Recorder is your confidential agent. It tells you—and you only, exactly what was done in any five-minute period of the day or night. You can positively know the actual cost of work. Because a Jones Recorder tells with accuracy each and every move of truck or driver. And it's "driver-proof"—it tells you confidentially if anybody tampers. There is a black and white daily record locked up in its body—the key is yours—to this, and to an actual knowledge of your real earnings—earnings based on unit costs.

Here are eight good reasons why a Jones Recorder tells you what each truck earns—*It tells:*

1. The time of start and return to garage.
2. The number of stops made.
3. The time, day or night, and duration of each stop.
4. The number of runs made.
5. The time of and duration of each movement.
6. The mileage covered on each run.
7. The average speed of each run, every five minutes.
8. And it records both forward and backward movements.

The Jones Recorder is furnished complete with 50 charts, and necessary fittings. Easily and quickly installed. The list price is $50.00 each, with prompt deliveries assured.

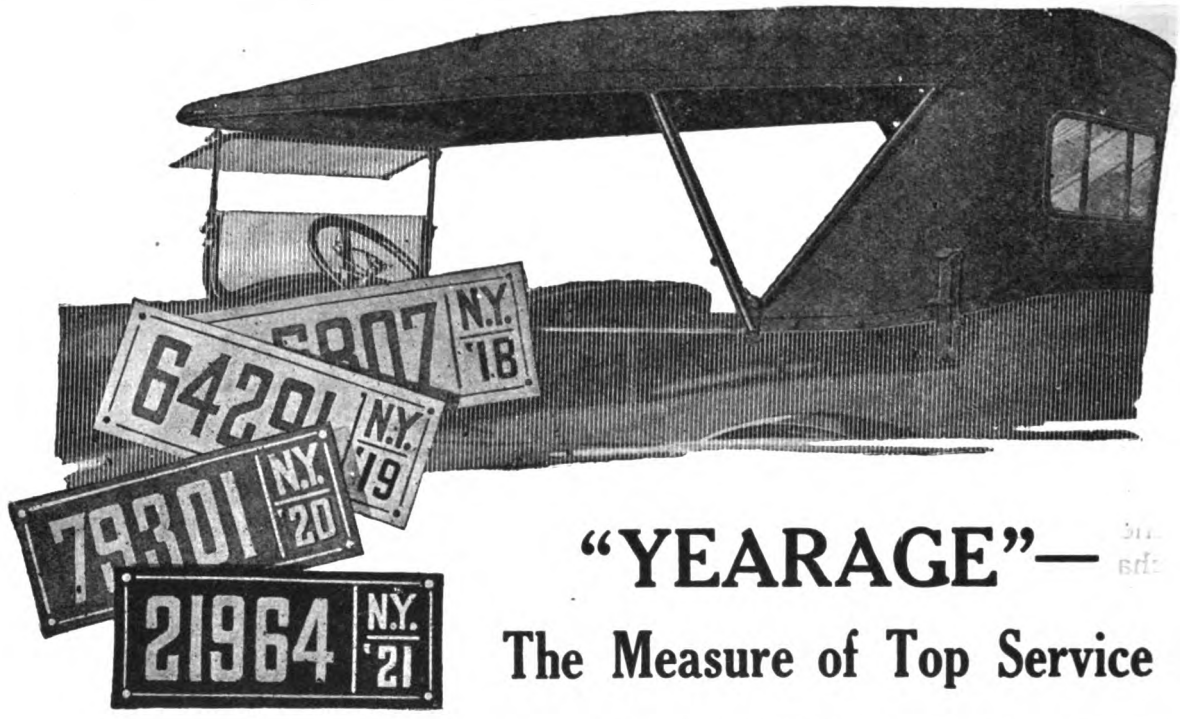
A SURE SIGN of carbon is a smoky exhaust, due to lubrication getting *past* the piston rings up into the combustion chambers where it *burns*. Leaky piston rings waste as high as 25% gasoline —one drop in four.

HI-COMP PISTON RING

"THE RING THAT MAKES THE MOTOR SING"

are the best gas-tight rings for overcoming engine troubles due to carbon—knocking, skipping, faulty ignition; valve pitting, wearing down of cylinder walls, piston and piston rings; smoky exhausts.

Hi-Comp Piston Rings are made from two perfectly balanced perfect eccentric rings into one absolutely gas-tight concentric ring. Each ring ground under oil — not buffetted — to preserve the true temper of the secret process gray iron and ensure high polish and gas-tight fit. Won't wear cylinders out of round — *proof* of gas-tightness. Make reboring of average cylinders unnecessary — an exclusive Hi-Comp advantage. Hi-Comp Piston Rings deliver every ounce of power from every drop of gasoline on to the piston head— no power or oil can get past them!



It will pay you to install Hi-Comp because of the satisfaction they give to you and your customers. Fully guaranteed by an old established piston ring company to give MORE POWER on less gasoline and oil. Write for booklet, specification chart and details of 90-day trial guarantee

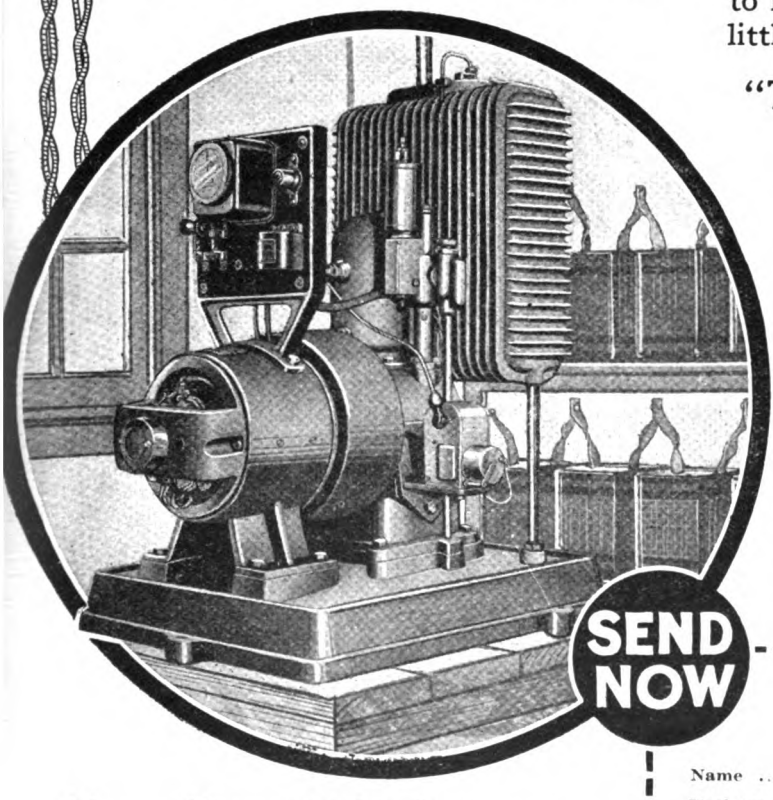
ALAMO ELECTRICITY

Dealer's Greatest Opportunity

WAR conditions are forcing automobile owners to adapt their business to meet radical changes. The logical solution of this problem is the selection of a line that meets three vital requirements: Immediate demand, purchasing power of prospects and reliability of the selected line.

A recent trade investigation shows that very few farm necessities have a greater demand than electric light and power equipment. Government statistics prove that the farmer never was more able to buy needed utilities.

Alamo Farm Light and Power Plant



The Reliable Electric Unit

In the Alamo Unit will be found all wanted features—many of them exclusively Alamo. It is the perfectly balanced unit. It requires no special foundation. It runs without vibration or noise. It is efficient, developing all needed power and light. It is economical, built to last a lifetime and requiring but little attention.

"The Nation Knows The Alamo"

Alamo Electricity is known throughout the land. It is past the experimental stage—the unit of known dependability. It is widely advertised and has an intensive selling plan behind it. *It is the plant that meets all dealer and user requirements.*

Send the coupon or write today for dealer proposition. Let us help you to take up the slack in your business. This plan will do it.

RAJAH FEATURES

Simple Construction

The Rajah Plug embodies no freak ideas or experiments. There are but five parts, all interchangeable, easily taken apart, cleaned and assembled.

Knife Edge Bushing

adjusts itself to the shoulder of the porcelain. All possibility of injuring the porcelain is thus eliminated when the bushing is tightened down to secure a gas-tight joint.

Insulation

consists of the highest grade, hardfire, heat-resisting porcelain, of special pattern, so assembled as to insure against firing through.

The Button Top and Rajah Clip Terminal

do away entirely with the necessity for either thumb screw, nut or other device for attaching the cable to the spark plug.

Rajah Terminals and Adapters

are furnished so that Rajah Plugs can be used with any car.

Rajah Regular Clip Terminal

Adjustable to any cable. With the extra collar supplied fits any make of plug.

Rajah Ferrule Clip Terminal

With any size ferrule required. Fits any make of plug with the extra collar supplied.

Rajah Thumb Nut Terminal

Adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six and Pullman.

Rajah Stud Terminal

Adapter for Buick, Chevrolet and Oldsmobile.

Manufactured by

Rajah Auto-Supply Co.

Bloomfield, N. J.

Sales Department

Edward A. Cassidy Co, Inc.

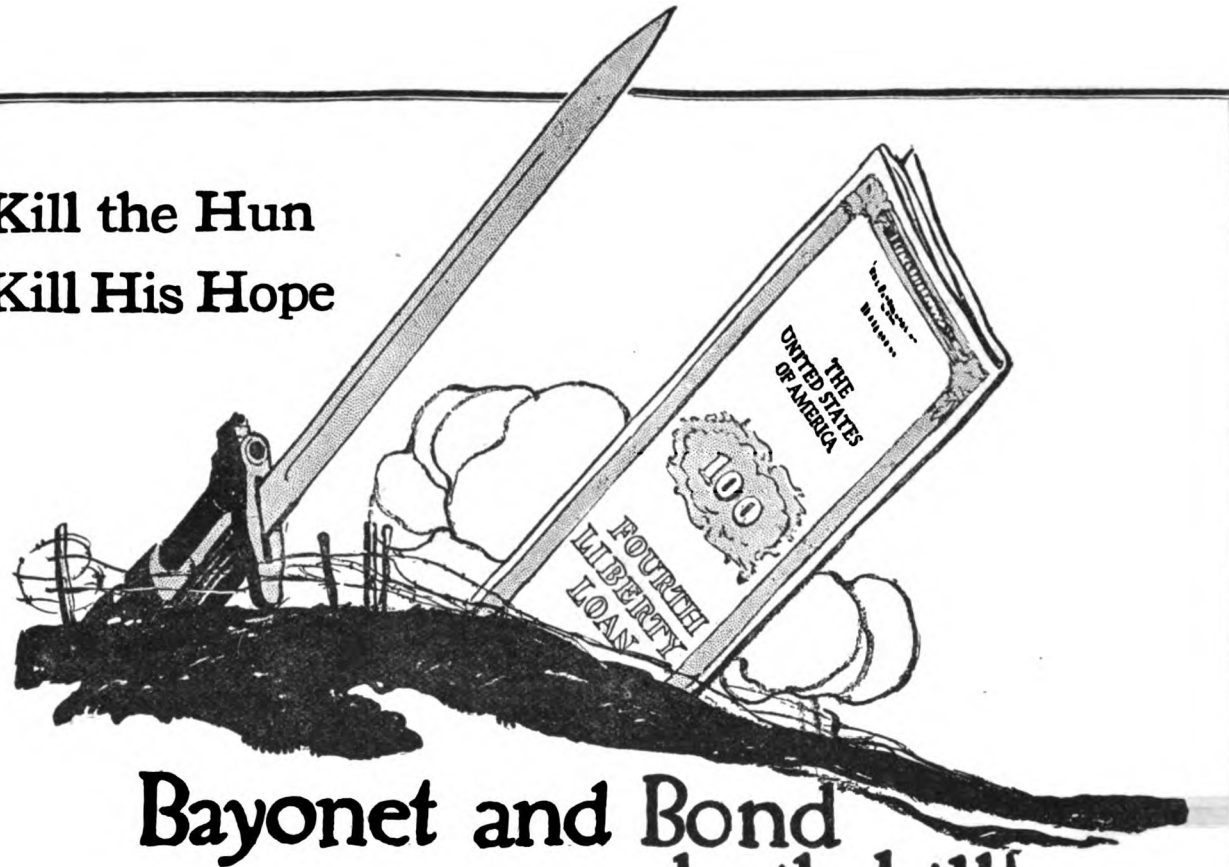
280 Madison Ave., New York

Backed by the racing world

IN a few vivid moments the racing car driver asks more of his car than the average car owner demands in six months' ordinary running. For his supreme needs the racer uses Rajah Spark Plugs because he knows they will make good.

While the demands of your customers are not so exacting, they do want the service, the efficiency, the power and the economy that a perfect and consistent spark plug will give. They get these qualities when you sell them the plug upon which the racing world depends.

Sell Rajah plugs in sets. Get your customers to take out all other plugs and try Rajahs as they should be tried.



That is the only way for them to enjoy the increased power, quick pick-up and uninterrupted Rajah service.

Kill the Hun
Kill His Hope

Bayonet and Bond -both kill!

ONE KILLS the Hun, the other kills his hope. And to kill his hope of victory is as essential right now as to kill his fighting hordes. For while hope lasts, the Wolf of Prussia will force his subject soldiers to the fighting line.

We have floated other loans, built a great fleet of ships, sunk pirate submarines, sent our men across and shown the Kaiser's generals what American dash and grit and initiative can do. The Hun has felt the sting of our bullets and the thrust of our bayonets. He is beginning to understand America Aroused—to dread the weight of our arms and energy.

This is a crucial moment. Nothing can so smother the Hun morale, so blast his hopes, as a further message from a hundred million Freemen, a message that says in tones that cannot be misunderstood, "Our lives, our dollars, our ALL—these are in the fight for that Liberty which was made sacred by the sacrifices of our forefathers."

30 minutes after you start using them

Give more power
Save gasoline
Save oil
Stop plugs fouling
Stop engine smoking

Within thirty minutes after you start your engine these rings will prove themselves to be an extremely profitable investment.

The minute oil grooves make it possible for these rings to seat themselves perfectly—almost instantly. The patent peening prevents waste of power by holding them to their tension against the cylinder walls even though the cylinders be worn out-of-true, and the wonderful "Always Tight" Expansion Joint compensates for any wear which may occur in the rings, keeping them permanently gastight.

Munger "Always Tight" Piston Rings are the easiest of all piston rings to install. Slip them over the Munger Ring Insertion Tool, which comes with each complete outfit, and they slide into their grooves without breakage or trouble of any kind.

A signed guarantee that these rings will do all we promise accompanies each complete outfit. If the rings do not give you entire satisfaction, return them at any time within thirty days to the dealer from whom you bought them, and he will give you your money back.

IMPORTANT TO THE PUBLIC!

ENEMIES of magazines and magazine reading are now claiming that the heavier postage increases of 100 to 900 per cent in the destructive postal "zone" law falls **only** on the advertising pages and that the 50 per cent increase is merely upon the reading pages, therefore readers are not affected! **This is false in fact and principle!**

As a magazine cannot be separated from its advertising—advertising which makes possible in its quality and quantity—this claim is fallacious and the postage increase must fall upon the readers of magazines ***for the entire magazine,*** *no matter how deceptively it may be described and separated by the enemies of magazines and magazine readers.*

Do not be misled by the absurd camouflage that the destructive postal "zone" system affects **only** the advertising pages—**because the "zone" postage must be paid under the postal law for the entire magazine which you read.**

The advertising pages are part of each copy. These terrific postage increases of from 50 to 900 per cent are imbedded in each copy—depending upon the accidental remoteness of each reader—and necessarily apply, therefore, to each and every copy.

And the reckless efforts to disguise obviously unjust postage "zone" charges are plainly evidenced by the futile arguments of those who established the postal "zone" system—a "zone" system utterly condemned over fifty years ago when it was abolished by Abraham Lincoln.

Congress last year enacted this hasty but permanent postal legislation, despite the fact that it had been twice rejected by the United States Senate and also unequivocally condemned by the latest official United States Postal Commissions. This postal "zone" legislation reversed postal history. This postal zone law, moreover, has been condemned by Ambassador Gerard, who earnestly said it was a law that would **aid pro-German propaganda.**

The Hon. Charles E. Hughes headed the latest official United States Postal Commission, when he was Justice of the United States Supreme Court, and which reported emphatically against the postal "zone" system; and further emphasis is lent to this "zone" system condemnation by the statement of Charles E. Hughes himself, on June 27th of this year, 1918, in which he again states that this postal "zone" law **"is decidedly a looking-backward and walking-backward measure" in postal history!**

Magazines are sold to the reader at less than their cost of manufacture—the only manufactured product in the world of which this is true. Magazines are enabled to do this by reason of the revenue from advertising pages; and the increase of from 50 to 900 per cent postage on the advertising pages simply means that in that particular copy of the magazine are imbedded all of these postage increases running from 50 to 900 per cent falling, chiefly, with terrific postal increases in the West.

President Wilson explains the function of advertising in relation to readers and the public, for he said when Governor of New Jersey:

"It must be that those who are proposing this change of rates do not comprehend the effect it would have. **A tax upon the business of the more widely circulated magazines and periodicals would be a tax upon their means of living and performing their functions.**

"They obtain their circulation by their direct appeal to the popular thought. Their circulation attracts advertisers. Their advertisements enable them to pay their writers and to enlarge their enterprise and influence.

"This proposed new postal rate would be a direct tax, and a very serious one, upon the formation and expression of opinion—its more deliberate formation and expression just at a time when opinion is concerning itself actively and effectively with the deepest problems of our politics and our social life.

"To make such a change now, whatever its intentions in the minds of those who propose it, would be to attack and embarrass the free processes of opinion. Surely sober second thought will prevent any such mischievous blunder."

This discredited and reactionary postal "zone" system now resurrected in the face of a storm of protests from the ablest minds in our country, discriminates unfairly against readers in different states by reason of their accidental remoteness from the city of publication. Readers in Eastern and Northern states will pay less postage under this postal "zone" law than readers in Western states, **and for exactly the same magazines!**

REMEMBER—THERE IS NO POSTAL DEFICIT; LAST YEAR THERE WAS OVER $12,000,000 SURPLUS!

Write to your Congressman in protest against the law and do it NOW! And if you will assist by another occasional letter or argument with a friend send your name to Charles Johnson Post, 200 Fifth Avenue, New York City.

Write to Your Congressman at Once! DO IT NOW!

PETITION TO CONGRESS—Sign Here!

The spread of education, of culture, of scientific knowledge and advancement, and of our vast internal merchandising and manufacturing has been, and always is, vitally dependent upon the freest and cheapest circulation of periodicals. The penalties resulting from any restriction on the freest possible circulation of periodicals will be destructive of the best interests of our economic life and the opportunities of developing our best citizenship.

The postal amendment passed by the last Congress, increasing the postage on periodicals from FIFTY TO NINE HUNDRED PER CENT with its postal "zone" system, will throttle or destroy our periodicals at a time when the widest and most extensive circulation of publications is essential to the patriotism, education and upbuilding of our country.

Therefore, I, the undersigned, do most earnestly demand the repeal of this burdensome periodical postage amendment.

"NORMA"

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

The user of a car or truck notes only the bare fact of failure. He concerns himself little with the cause of that failure. He puts the full responsibility up to the builder of the car or truck. His condemnation covers the machine as a whole—no matter how small the part to which the failure is directly chargeable.

Failure of a bearing in magneto or lighting generator means, in effect, failure of the car or truck. Responsible builders, therefore, have protected themselves by adopting magnetos and lighting generators embodying the security against bearing troubles for which "NORMA" stands.

RADIATOR PROTECTION
With the Guess Left Out

TO fill your radiator with Norwesco "TWELVE-TWENTY" is to *know* your radiator won't freeze above 20° below zero. Ordinary solutions deteriorate because of leakage or evaporation and you have a frozen radiator just when you think you are protected. A common battery hydrometer makes a quick, easy test with

NORWESCO
TWELVE-TWENTY
PREVENTS FROZEN RADIATORS

Comes in a "Chemically Correct" solution ready to use. No mixing. No measuring. No dissolving. Just pour into the empty radiator. Boiling point 12° higher than water—evaporates slower. Warms engine quickly—less "popping" on a cold day.

Will not "find" leaks like many non-freeze solutions.

Made by creators of SE-MENT-OL, the radiator cement with a million users, and SKALEX, the radiator cleaner.

Price $1.25 per gallon can, $3.45 per 3-gallon can, $5.00 per 5-gallon can. (20c per gallon additional West of Rocky Mts.)

Write for our 20-page booklet, "Care of the Cooling System." It contains many valuable suggestions.

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

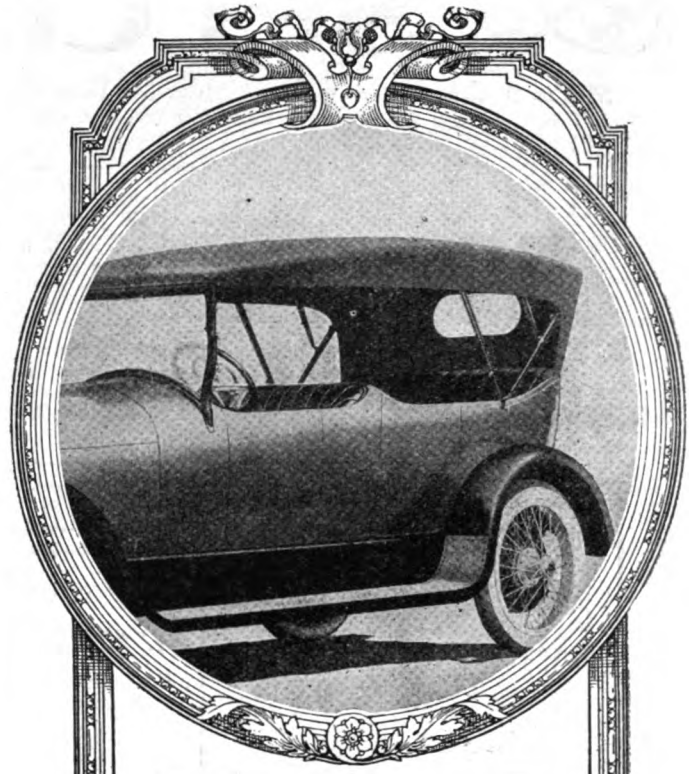
Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding qualities as well as economy commend them to every car owner.

The Big One-fourth Retread Feature



Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

$3.82 SEVENTH EDITION $3.82
DYKE'S AUTOMOBILE ENCYCLOPEDIA

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 Instructions—Simplified and practical.

3500 Illustrations—the kind you understand at a glance.
3 Supplements, parts printed in colors, treating on the construction, operation, repairing and adjusting of the FORD and PACKARD—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc. Airplane Supplement.
775 Illustrations and 279 pages on Electric Ignition, Electric Starters and Generators, etc.
51 pages and 254 illustrations on Adjustments, Tests, etc., of leading Electric Systems.
154 pages and 1189 illustrations on Repairing. Oxy-Acetylene welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.
27 pages and 180 illustrations on Tires and Tire Repairing.
44 pages and 119 illustrations on Carburetion.
89 pages and 291 illustrations on Engine and Parts.
16 pages on Digest of Troubles.
6000 lines to the Index. This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. Index begins on colored paper, easy to refer to.

Dictionary is also included, which gives the meaning of motoring terms.

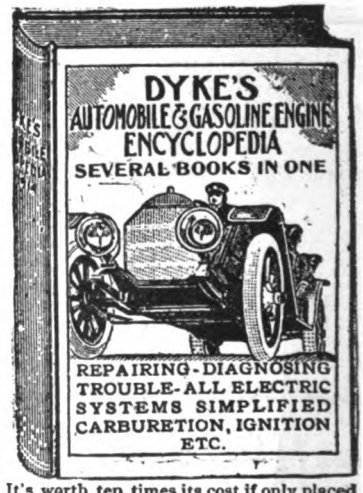
Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS

TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

IMPORTANT POINTS ABOUT PAINT AND VARNISH BRUSHES

A Set of Three Brushes and the Automobile Dealer and Repairer for One Year for $2.00

Brushes Needed in Repainting and Varnishing an Automobile.

Did it ever occur to you that there was much difference between a good paint or varnish brush and a poor one? Probably not. To most people a brush is just a brush. Yet an analysis shows that there is an almost measureless difference between a good brush and poor one.

For instance, a properly made Flowing Fitch brush is hermetically sealed, so as to keep the paint, or whatever may be used, from getting into the brush at the top and loosening the hairs. All such properly made brushes are solidly set in glue cement inside a leak-proof ferrule, and a whole row of neatly clinched nails are driven in at the end of the ferrule to give added security, and a guarantee that the hairs will not pull out.

A Fitch brush is *smooth, soft,* and *flowing,* and does not "mush" up or get flabby like a cheap brush, but holds its springiness. The trouble with cheap brushes is that the ferrule is nothing more than a single band of tin, open at the top, with a couple of nails jabbed through. When you use such a brush the cheap hair will pull out and scatter all over your work, because it is not held in securely enough to stand the drag of the brush in painting or varnishing.

A brush may be washed with gasoline or kerosene oil, but to clean it thoroughly turpentine should be used. No brush used for painting should be used for varnishing.

We have recently made arrangements with one of the best manufacturers of these properly made brushes in New York to offer a set of Three in connection with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year for an even $2.00. These brushes sell at retail for $1.40. It will be seen, therefore, that there is a substantial advantage in sending to us for the AUTOMOBILE DEALER AND REPAIRER for a year, and for a set of these brushes.

Present subscribers can have their subscriptions extended for a year, and secure a set of brushes, on the same terms. These brushes are guaranteed in every respect, and though they cost more than cheap brushes would cost, they are far cheaper in the end, because of their lasting qualities and the good work that can be done with them. No man can afford to waste expensive paint and varnish on an automobile by using a cheap and poorly constructed brush, such as is usually to be found wherever brushes are sold. The ordinary dealer in brushes himself as a rule has very little knowledge of the quality of the brushes he sells.

Remit by check or money-order, and your name will be entered as a subscriber to the AUTOMOBILE DEALER AND REPAIRER for a year, and a set of these brushes, which are just the right size and shape (see illustration, which is exactly one-half the actual size of the brushes,) will be sent to you, postage prepaid.

CONNECTICUT

Products are noted for the Simple Practicability with which they Perform their Functions

The switch illustrated above is a "3-gang" type N Lighting Switch.

This is one of the neatest, simplest and most easily installed switches on the market. The body of the switch is made of materials which will resist the most intense heat, sturdy construction insures indefinite life.

The Connecticut Type N switch is designed so that pulling out a button switches on the light—pushing it in switches it off.

One marked advantage of this switch is that buttons are large enough to be operated easily by a heavily gloved hand.

Type N switches are made with from one to four control buttons and all that is necessary to install is to bore a circular hole in the dash, or in case of a multiple gang switch, as many holes with ⅞" centers as there are buttons, including the brass escutcheon plate, as desired.

Put your lighting control problems up to us.

We have a standard installation which will accomplish any result you require.

Connecticut switches have been famous for years for their neat design and sturdy construction.

It is the exception when one needs repair or replacement during the life of an automobile.

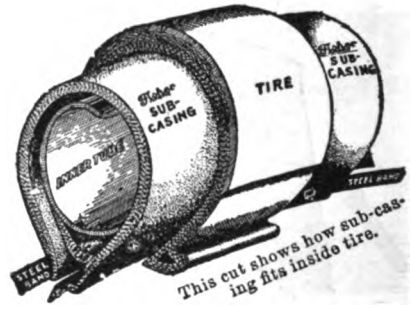
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE

LESS TIRES TO BUY

The Blows That Your Tires Receive, When You Strike Objects in the Road, Leave Weakened Places in the Fabric

A TIRE IS AS STRONG AS ITS WEAKEST POINT

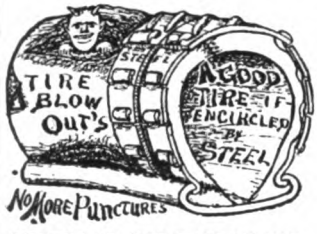


The weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings.

Write for Particulars

FISHER MANUFACTURING CO.



1706 Payne Avenue **Cleveland, Ohio**

This cut shows how sub-casing fits inside tire.

Hang on to your old tires. They will last as long as you live if covered with steel. **The Kimball Steel Protector** makes **Blowouts, Punctures** and **Rim Cuts impossible.** A few sections will hold any old blowout. Tires as flexible as ever.

Special inducements to those in new territory.

MUD CHAIN can be put on in a jiffy with one hand while standing on the run board. If you get in a mud hole you will laugh out loud. Hook the ends together and pull the little lever and they are on tight. Good for blowouts.

KIMBALL TIRE CASE CO., 174 Broadway, Council Bluffs, Iowa

Price: $10 per set
(4 bearings)
In Canada $15.

The Only Scientifically Correct Roller Bearing for Fords

After continued tests in actual service a common fault in all taper roller bearings for Fords was discovered. The inner ring, being subjected to a continuous twisting strain, has a tendency to move out of position and thus ruin the bearing. Inability to provide a proper seat for the bearing is the primary cause of this trouble. With this fault in mind the Wright Bearing was improved by the addition of a second surface (see cut). This second surface being at right angles to the other, holds the bearing firmly in place and makes it absolutely impossible to move.

A glance at the cuts will show the firm manner in which the Wright ring is seated in the hub and a comparison of the Wright ring (at top) with a general type of ring (at bottom) will show the radical difference in construction.

The fundamentally correct design of the Wright Bearing makes this feature (on which patents are pending) possible to the Wright type alone. No other bearing can have it without changing the entire design of the bearing itself.

Thus the Wright Bearing, which embodies the correct fundamental principles of bearing design, has added another exclusive feature to an already proven superior product.

Ask your dealer or jobber to show them to you

THE PETRY VENTILATOR

For Ford Cars

Patent Applied For

A greatly desired necessity for the Ford driver. Perfectly ventilates the driver's compartment, eliminating the discomfort from a hot motor. Opened or closed at will from the driver's seat. The baffle plate and sides form a scoop which catches and throws all the air on the floor—not on the passengers.

Little or much ventilation. The only Ventilator which has the adjustment feature self-contained. Water-proof and dust-proof when closed. No springs—no rattle—nothing to get out of order. Unsurpassed in appearance and efficiency by any built-in job. Made of stamped steel, handsomely finished in baked enamel. Application on the cowl is simple and inexpensive.

FEDERAL TIN CO., Sole Manufacturers, Charles and Barre Streets, Baltimore, Md.

The Clark Electric-Steam Vulcanizer is Built for the Garage Man Who Wants Tire and Tube Repair Profits.

This outfit puts you in the vulcanizing business immediately—at lowest cost. No boiler to fire—no danger—simply hitch to your electric light socket. No current used when not working. Can be placed anywhere.

Absolute pressure control—cannot overcure. Handles all ordinary repairs to tubes and tires. Requires no watching. Endorsed by 17 leading tire manufacturers.

Vulcanizing work costs nothing to get. It pays big profits. The rising cost and scarcity of tires and the elimination of sizes has trebled the repair business.

Don't delay. Get the facts. The low price and big range of work of the Clark Vulcanizer will astonish you. Write at once—let us tell you how to get a machine quickly and make Vulcanizing the most profitable part of your business. Act now.

The Undertaker and the Graveyard

The Post Mortem of the Sick Car Series. It Deals With Live Cars Resurrected from Dead Remains.

WHEN I started the "Sick Car" series in July, I did not expect to let any of the patients die on my hands. At the time I did not think of the "Undertaker and the Graveyard," but death is one of the surest things that overtakes us, and naturally some of the patients are bound to turn their toes, or, better still, their wheels upward—and it is not to be expected that they will continue to exist forever.

I had counted on a somewhat different story than the one that this is to be, and had written to a number of manufacturers for details and data which would help me out, but one and all of these manufacturers overlooked the point of my story, to a certain extent, and wrote me that they did not care to be classed as "dead ones," or to have our readers feel that they were doing "graveyard business."

The American people as a rule are rather optimistic, and if we did not know that every one of those not living at present have at some time passed away, we would be inclined to feel that there was no such a thing as death.

There is one point on which the theme of my story differs from the general scheme of the life of human beings, and that is, the car undertaker is not always associated with machines whose days of usefulness are over. The car undertaker of today is the man who brings dead cars back to life again.

A Real Grafter.

If he does not bring the cars in their entirety back to life, he at least makes use of many of their parts. He is a "grafter" in the true sense of the word. He is more than a skillful surgeon in that he can graft crank shafts from dead cars into live cars. He will remove the heart, the lungs and the stomach from an automobile which has passed away and save it to be used in a car whose other organs are intact.

That is what I mean by "grafting," and if some car undertaker happens to read this article, I don't want him to think that I am casting a slur upon his business, because his office to the automobile and the automobile owner is that of a good Samaritan, and I have never yet heard of any used parts manufacturer who charged more for the parts than they are worth. As a matter of fact, I hardly see how many of these used parts may not make the business pay; the products are so cheap.

The automobile is not like the famous one-horse shay of historic fame. It does not drop to pieces or wear out all at once. Some automobiles last longer than others, and, following the same argument, some parts of some automobiles wear longer than others. It would be perfectly possible then to disinter an automobile that had been put away in the back of a garage, and find some part of it that could be used again.

For instance, suppose you were able to make a collection of two or three dozen old Ford cars that had been thrown into the junkyard. You would probably find that all of the frames, springs and casings were in good condition. You might be able to salvage two front wheels and fittings from the lot. You might be able to pick up one rear axle with which the replacement of three or four gears would give as much service as a new one.

A Composite Machine.

The engine itself might require considerable overhauling. The crank case, transmission cones and connecting rods, together with the pistons, the cylinder head and the crank shaft of at least one of the cars could be used

Digitized by Google

again. It only remains for you to salvage all of the parts which are in the best condition and put them into a composite machine.

I once heard of a garage man in a large city who decided to build an automobile out of the machines coming into his shop without putting in money upon it beyond that of paying junk prices. Within six months he was able to put on the road a car in running condition, his only cost was that of certain new bronze bushings for various bearings.

He followed a system of substitution which worked out something as follows: When a car owner brought his machine into the shop for the replacement of certain bearings, the garage man removed the old part and put in a new one, charging the cost to the owner.

The old part he examined carefully and entered upon a chart which he kept in the office. If he had already a part like it, he junked the worst of the two and kept the best one. As he was also a dealer and agent for Ford cars, he was able to pick up many old cars at junk prices. These cars he pulled to pieces, putting all of the iron in one pile, the bronze in another, the aluminum in another and the steel in a fourth, thus doing the work that the junk man does, and selling the metal at a higher price than ordinarily could be obtained for a completely assembled junk car. He saved only those parts which he needed and which might be used again.

Visit the Junk Yards.

If the reader is interested in obtaining an automobile without paying a new price for one, he should adopt somewhat the same procedure. I think I am right in saying that in every city throughout the country there is at least one junk man who makes a practice of buying second-hand cars, and with a little judicious buying anyone who likes to utilize their spare time working upon machinery can collect enough parts from which to build a machine, which may not compete with a Rolls-Royce or a "Fierce Sparrow," but it will "puff" them around the streets of their town and possibly attract considerable attention.

I know that the machine which I constructed in a similar manner was always the center of a group of people. I will not say that the audience was an admiring one, in all cases, however. Quite frequently the machine was the center of an enthusiastic group of youngsters who looked upon it rather the same as they did upon the "Packard Twin Six" which one of their playmates had constructed from a pair of baby-carriage wheels, an old soap box and parts of their big brother's bicycle.

Notwithstanding the handicap of appearance, the car which I have reference to had enough power to carry it up any grade that I ever encountered, and I have reason to believe that the person who purchased it from me put the same faith in it that I did. At any rate, he made an attempt one day to go up a telegraph pole which presented a 100 per cent. grade. The machine might have done this had it been properly equipped. As it was, however, either because of poor driving, or because of some inherent defect in design, it failed to negotiate the grade properly and so went to its doom.

In another portion of this magazine is the second instalment of the article relative to salvaging an old car, and so I will not take up in detail any particular machine, but give a few general suggestions which are applicable to many machines now on the market or which are out of the market because of their age.

Various Important Units.

Let us take up in detail the various parts which go to make up an automobile. First, the engine, and this is the most important unit. One may well say that the life of an engine depends directly upon its cylinders and its valve seats. Let me explain.

No matter how deeply scored or how badly worn an engine cylinder is, there are ways and means by which certain repairs can be made, providing there is enough metal left in the cylinder walls. The cylinders may be rebored or reground, if they are out of round, and if they are perfectly true, the scores may be plated or filled with a welding compound, thus restoring their value. Still, if the valve seats have been worn through or if the valves cannot be ground any further into the seats, then the cylinder block has ended its days of usefulness.

Don't attempt to grind the valves in an old engine block if the tops of the valves are more than 1/16 of an inch below the surface of the valve seats. Even though you may be able to obtain a tight joint at the valves, there will be a great loss of power because the valves will not permit a large enough opening for either the intake or the exhaust gases.

There is another point that I want to caution you against, and that is not to rebore the cylinders of an engine more than twice. Of course there may be exceptions to this rule, but a good mechanic can usually tell whether the cylinder walls have been cut too thin or not. Provided the cylinders and valves are in condition, one can always repair the block. If the water jackets are cracked they can be welded. If the cracks are small, however, the welding process is entirely unnecessary in many cases.

Repairing Water Jackets.

Let me tell you how you can repair small cracks in the water jacket. Remove the cylinder block from the engine and plug the water outlets. Then fill the water jacket with a concentrated solution of copper sulphate and water. Copper sulphate, which is often termed "blue vitriol," contains a high percentage of copper, and when the jackets are filled with this solution, copper immediately deposits upon all of the clean surfaces.

The solution at first will leak through the crack and so a basin should be put beneath it to catch the liquid. After the liquid has been poured into the cylinder three or four times, the leak will grow smaller, until finally

Digitized by Google

the crack is filled. I have seen some very large cracks mended in this way, but do not expect to have good luck in every case. Still the cost of the treatment is so far below that of welding that it always pays to try the experiment.

Pistons and connecting rods last almost as long as the car. The wrist pins or pistons can be bushed to fit their respective bearings, and the connecting rods may be repaired as directed in the article by W. O. Mann. Crank shafts can be turned by a machinist so that they will give much service unless they are badly damaged. Of course old gears which are badly worn should be replaced with new, as must also pump bearings or certain other parts.

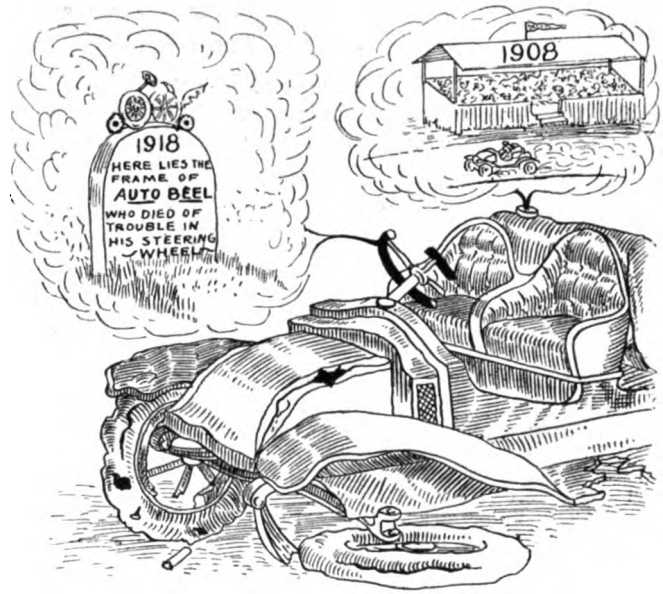
A word to the car owner who is not familiar with the various machines now in use: At the present time there are at least fifty different makes of engines and cars in active service, so that even though the wreck which you have come into possession of is a so-called "orphan," you may be able to replace certain parts with new parts obtained from one of the active manufacturers.

Where to Buy Parts.

Suppose, for instance, you are obliged to replace a connecting rod. Visit all of the car agencies in your town and see if one of them does not use the same size connecting rod that you wish. Possibly one connecting rod that you may obtain will be identical with yours except that the holder for the wrist pin is too large. All you need to do then is to use a larger wrist pin bushing.

The same thing is true of valves, valve springs, tappets, timing gears, starting crank ratchet (a part of which wears very fast), flywheels and even gaskets. If the car which you have is fitted with a standard engine such as a Continental or a Budda, you need only to consult a list of car specifications to find upon which machine this engine is being used and obtain the parts from the salesman of that particular car.

Electrical apparatus is fairly well standardized. Once you know the name of the manufacturer of the electrical apparatus on your car, you can obtain supply parts from the agent who carries a car equipped with similar apparatus. Do not feel that you need to have all of the parts made at the nearest machine shop, for you do not. Visit the nearest junkyard and spend a few minutes hunting around. The result will often surprise you.



I remember when I put my car together I spent about three days in a junkyard hunting around for most anything that would answer the purpose. I carried home in the neighborhood of 200 pounds of junk iron, steel, copper, wood and aluminum, and I frequently received many surprises after I had arrived at home with my purchases.

The greatest trouble I had was matching springs. In one pile at the junkyard I picked at least a dozen springs (or parts to a dozen springs), for in every case at least one leaf was broken. I spent two hours hunting through the pile and finally, after hauling over at least two tons of rusty iron, I located three-fourths of a set and a single leaf for a fourth spring.

I spent two days at a later date trying to match up this fourth spring and never succeeded. My car was fitted with three springs of the same make and one of another. It looked all right if you viewed it from a three-quarter angle.

The Eye Is Fooled Easily.

There is another surprise that one is apt to get in looking for the remains in a junkyard, and that is the deceptiveness in sizes of certain parts. I had my car nearly complete before I decided that it needed a steering gear, and so I hastened to the yard in hopes that I might find such a device. I was not disappointed. I found them there in every stage of repair, but as I looked them over I noted that the wheels all seemed to be very small. I picked out the largest that I could find, and

Dreaming of Days Past and to Come.

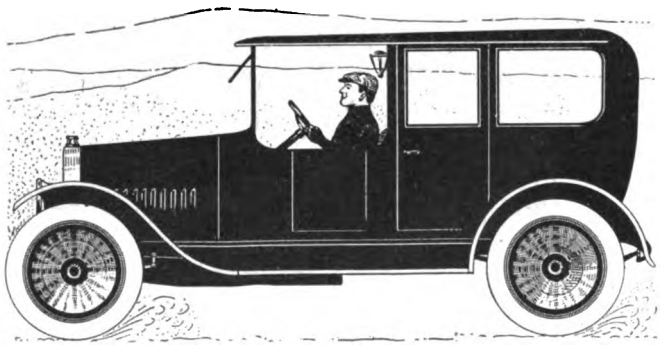
when I got it home I bushed the wheel and put it in place.

Not until then did I measure it and discover, much to my chagrin, that whereas the old car had been fitted with a twelve-inch wheel, the one I was putting in place measured a good eighteen inches. I had the seat in place and unless I wanted to rip the whole thing out there was no way of changing the design. The wheel was almost as large as the car, and in driving I always carried it in my lap. The only way that one could "get out from under" it comfortably was to crawl over the back of the seat, and for a time I contemplated the fitting of an iron ladder from the ground, in the rear, to the top of the seat.

It was then that I realized how deceptive measurements can be. The extremely small wheels which I had noticed were really large enough, and only appeared

Digitized by Google

small because an automobile was not near, with which to compare them.



Transmission parts are easy to obtain because so many parts are standardized. If one is fortunate enough to obtain an old transmission of popular make, then new parts cost but little in comparison. Always bear in mind that perhaps there is a car on the market which is equipped with the same transmission or a similar one to that which you are using.

The same thing is true of rear axle parts. Once you have the housing, the gears and the bearings are easy to obtain.

Anchor the Gear-Set Firmly.

The transmission gear-set which I used was of peculiar construction and unlike anything I had seen up to the time I built the machine, nor have I seen one like it since then. As I remember it, it was made as an experiment. It was of the planetary type and shaped very much like an elongated egg. The front was designed to connect with the engine, the rear to the propeller shaft, and except for two or three bolts in the side there was no way by which the thing could be fastened to the frame.

Not realizing that a gear-set must have some point of anchorage, I connected it properly, but failed to fasten it to the frame. The first time I started the engine and threw in the low speed forward gears, this transmission did a "Highland Fling" and nearly wrecked the floor of the machine. It turned completely over and twisted

You Can't Build a Classy Touring Car, But You Can Get Around the Country in It.

off the control rods before I could stop the engine. Finally I managed to anchor the transmission to cross members made from pipe fittings, which gave entire satisfaction until one day in ascending a hill one of the lengths of the pipe twisted off. This trouble was remedied by the use of hydraulic pipe rather than an ordinary iron pipe.

The ingenious "undertaker" can easily surmount every difficulty presented, if he bears in mind that there is a fitting made for about everything one desires. Iron pipe or tubing can be used for various fittings and combinations of the two can be made to answer every purpose. Iron pipe is measured from the *inside,* while tubing is measured from the *outside.* Thus a piece of two-inch tubing will slip into the hole in a two-inch length of iron pipe. For odd sizes one can use hydraulic pipe.

It is always easy to give advice when one has had experience. The body of the machine which I built had as its foundation an old door, but it might have been made much lighter if it had been built of joist with sheet iron panels. Although doors and hoods, as well as the backs of seats, are seemingly hard to construct, the amateur will find that the bending of sheet iron into proper shapes is an easy matter. A heavy mallet and a piece of iron to pound upon can be used to shape panels and doors to good advantage.

Bolt the Body Firmly.

Never make the mistake in thinking that an automobile body need only be rested upon the frame. It must be bolted (with a capital B) or the car will run away and leave the body in the road, sometime or other. The operator in a case of this sort usually has to make a quick decision as to whether he will stay with the machine or the body, and frequently he changes his mind after having stayed with the machine for a few minutes. and so I caution you again to bolt the body firmly to the frame.

If the machine is of the old type and is not fitted with an up-to-date ignition apparatus, by all means install a single unit system or a magneto. You can obtain a magneto second-hand at surprisingly low cost. You may not be able to fit a starting and lighting system on the old model, but you can equip it with a generator.

Generators, as they are being made at present, are exceedingly long lived. I think I am safe in saying that an ordinary generator will wear out two cars, sometimes more. You can drive the generator by a belt from the flywheel or by a chain from the timing gears or the fan pulley. The latter gives the most satisfaction.

I used an old acetylene generator and a single large headlight for a time, but the only time the generator gave satisfaction was from sun-up until sun-down. During the evening it seldom generated any gas for the light, so I managed to obtain a large generator which kept the storage battery charged and gave enough current for a very large spotlight, though it was not called a spotlight at that time. Spotlights had not come into existence. With the generator and storage battery I was always sure that I could obtain sufficient current for the ignition system, something that I had not been sure of before, while I was using dry batteries.

The Undertakers.

At the present time there are many manufacturers who make a business of putting out new parts for old cars. They call these "orphan parts manufacturers." They buy the patterns from the car manufacturers who have gone out of business and from these they make parts to fill the demand for owners who have purchased cars no longer manufactured. From these manufacturers one

Digitized by Google

can obtain parts for practically any make of car ever built.

There is another class of men who make a business of tearing cars to pieces and salvaging the useful parts. These men I always refer to as "undertakers," and both of these business houses lend their able assistance in brnging to life cars which seemingly breathed their last and may be classed among the "dead ones."

Foiling the Plans of Old Man Winter

When Winter and His Son Jack Frost Blow Upon Your Car a Shiver Runs Down Its Spine Unless You Keep It Warm.

BY W. L. ALMY

OLD FATHER WINTER may be a long time in getting there, but when he does arrive he certainly intends to pay you back for trying to crawl away with that old car you have in your garage. The old man has always conspired with new car manufacturers.

As soon as you buy a car the quality of gasoline

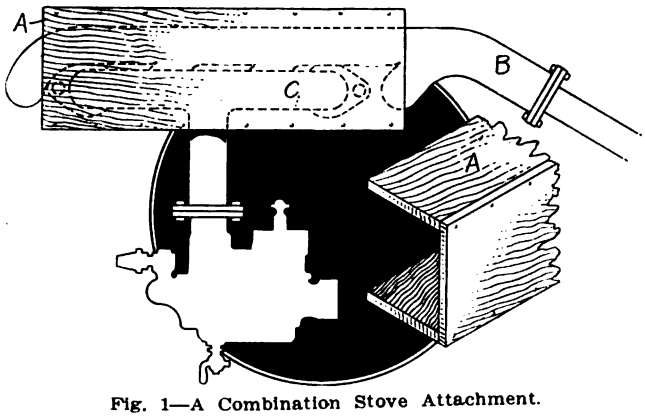


Fig. 1—A Combination Stove Attachment.

drops and you find that old man Winter certainly helps to blister your hands and keep your engine from running. Winter equipment for your old car is the one necessity that you can hurl towards old man Jack Frost. Don't let him keep his hands cool on your engine.

The gasoline of today is not what it was a few years ago, and when the chill of November and winter months strike it, it forgets how to vaporize. It shrivels up, so to speak, and contracts, like you do when you put your nose out of doors on a cold winter morning. You cannot expect your engine to work if you freeze the gasoline, and unless you keep the machine equipped with modern fittings you lose your bet with old man Winter.

He wins and you lose. You crank your car for a half hour in the morning just for exercise, then walk to the train, deciding that that is the cheapest any way.

In the first place let me tell you what an easy thing a gasoline engine is to start—if you know how. It is an old superstition that a horseshoe brings good luck, and I am going to verify the old superstition, which is just as good today as it was 100 years ago, but said horseshoe does not bring good luck if you leave it hanging over the garage door.

The next time your automobile balks in the morning, shoe it, and this is the way to do it:

Carefully remove the horseshoe from its old position over the door and heat it almost to a red heat in the furnace or over a gas stove. Gently seize it with a pair of pliers, not your fingers, by the way, though you will seldom make this mistake twice, and place it in its lucky position around the intake manifold just above the carburetor on your engine. Within five minutes you will find that the old superstition is a proved reality. Your engine will start and, shortly thereafter, run without a hitch. Don't forget to remove the lucky horseshoe from the manifold. It would not be seemly to leave your friend on the street. You may need it the next morning.

I have said that "the engine would run without a hitch," but in saying this I assume that you have carefully perused this article already and followed the rest of the suggestions which I outline. You would not expect to do good work if you had a severe cold in your head, yet under ordinary conditions you expect your

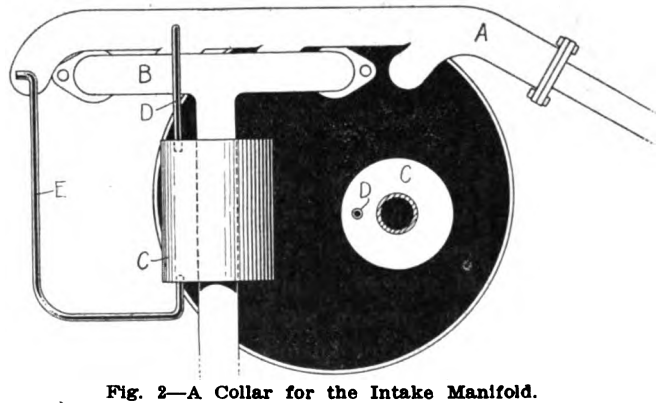

Fig. 2—A Collar for the Intake Manifold.

automobile engine to give satisfaction when you feed it with a draft of ice cold air.

You would not expect to go to work in the morning after eating a breakfast composed of cold food and ice water, yet is it not just what you ask of your engine? What is more, in reality you actually put a cold water bag on its stomach if you are not careful.

The first thing you want to do after you have read this article is to see that the air intake of your carburetor

Digitized by Google

is fitted with a hot-air stove which connects to the exhaust manifold. Then have a tinsmith make up a sheet iron cover like the one shown in Figure 1 at A. This cover should be large enough to enclose the exhaust and intake manifolds. After it is in place it should be securely fastened so that it will not rattle.

If you follow this suggestion you will find that the hot air from the exhaust manifold B warms the intake manifold C, and that to a certain extent you make a combination manifold of the two. Should you be fortunate enough to own one of the popular cars known as a Ford you can purchase one of the combination manifolds, which can be obtained from any accessory dealer. There are many such manifolds made, and the full purpose of this device is to warm the gas passing into the engine by the exhaust gases.

Not all car owners can obtain such manifolds, because they are not made to fit all cars. Neither can the suggestion sketch in Figure 1 be followed in all cases. Where the engine is of a peculiar shape or other fittings are attached to the manifolds it is not always practical to cover them both with a hot-air stove. In Figure 2, however, is illustrated an idea which should prove practical in many cases.

At A and B are shown the exhaust and intake manifolds respectively. Around the "neck" of the intake manifold is placed a collar of heavy sheet iron. This should be riveted rather than soldered, and after it is in place it should be fitted with a cover at each end. The exhaust manifold should then be tapped for a quarter-inch pipe, and this pipe connected through a tube D with the collar C.

The lower end of the device should be connected with the tube E, which leads upward and away from the carburetor. This latter tube must be furnished or there will be danger that the exhaust gases will set the carburetor afire.

In the insert at C is shown a top view of the device with the exhaust fitting at D and a cross section of the manifold. The purpose of any hot-air fitting around the intake manifold is to vaporize the gas or to keep it in vaporized form. Otherwise the fuel will condense upon the manifold walls and the engine will not run smoothly.

Show Windows Are Very Important Factors

If You Allow the Spiders to Spin Webs and the Mice to Play in Your Show Windows, You are Discounting Your Biggest Asset

BY FRANKLIN MYERS

THIS is not the time for the retail store men to sink into innocuous disquietude—it is just the time to show real signs of life. Christmas is coming and it will be a more glorious Christmas than ever before.

Uncle Sam insists that we cut off all "fol-de-rols" and stick to the essentials; that our gifts this year be of the practical and useful sort, and in view of this fact, the retail dealer in auto supplies fits the breach like a new shell in the guns abroad. LICK THE BOCHE by keeping your business in the "going" class. Don't let the cobwebs and spiders accumulate on your shelves.

To sum up the present situation—most all cars, in these times, are used for business more than for pleasure—we know this. There would be no justification in allowing cars to lie idle because of improper equipment or lack of material. An idle machine is a sign of mismanagement as well as decadence, and we are far from that.

Now, Mr. Retailer, let's get down to business. It is time for you to make a decision as to what kind of a display you will have for your window this Christmas season.

Oh, yes, we know about that progressive euchre party, and then Thursday nights, that's the evening the bowling club meets—of course you've just got to see the latest big show—and we know all of your time is tied up with other extra special dates. Any time for business at all, or are you just kinder letting the other fellow, Mr. Competitor, run away with more than his share of the business?

"I'll get at it tomorrow"—but tomorrow, somehow or other, runs into next week, and the next, and the next and during this period of procrastination and delay, the other fellow—your competitor—is plugging—steadily plugging away on his Christmas window displays.

"Displays?"

Yes! He's going to make a change every two weeks—he's in with a good sign painter and every evening they get together and plan and scheme and work their brains so as to drag in all of the customers they can.

He hasn't any time for that "big show"—you don't see his name on the bowling team—No! For several nights lately, he has not put his head on the pillow until the "wee sma hours." But he intends to have a Christmas window with a change every two weeks, from now on.

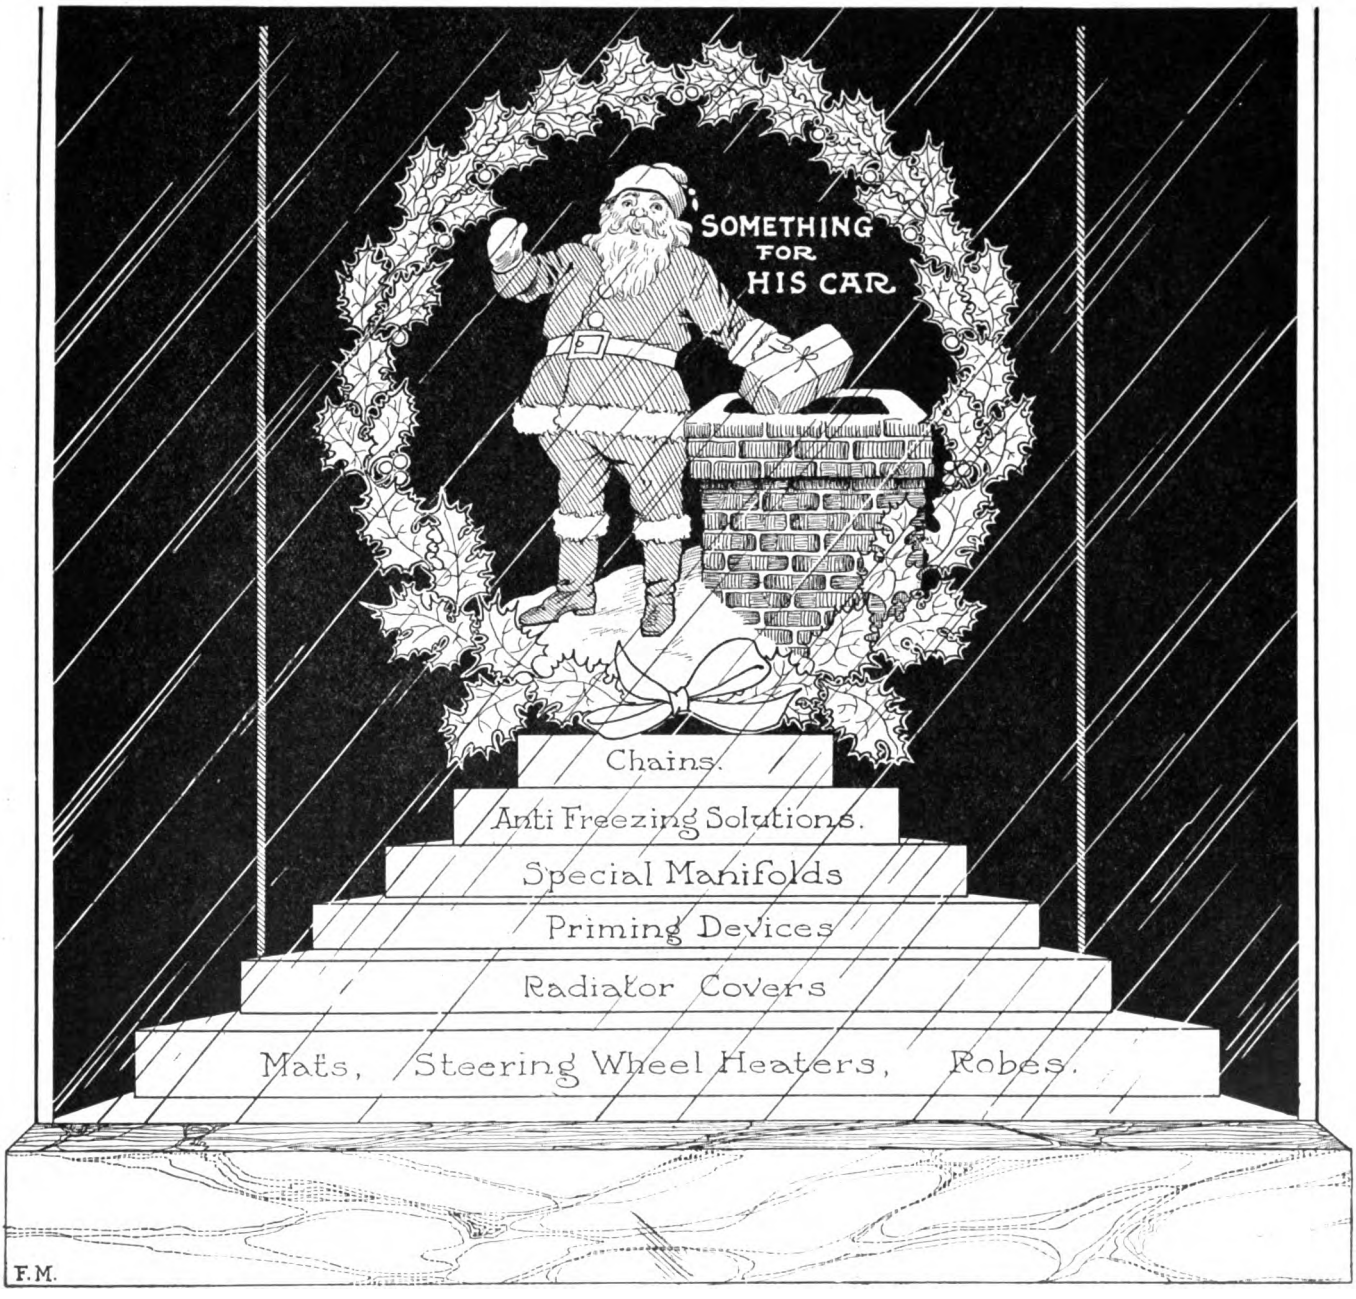
"Too early?"

Not by a long shot, "the early bird catches the customers." Don't you begin to catch the Christmas spirit

Digitized by Google

the minute you see the first Christmas show window? Don't you watch for them along about the first of November? You know the whole town talks about the first Christmas display that appears, and thinks that it's about the "best ever." Your competitor is going to be the "early bird" if you don't set your alarm clock ahead.

He's going to have a real show—something for the people to talk about, something for grandma, mother, dad, and the kids, to go crazy about. It's clever advertising and he knows the value of his window space. He's enthusiastic, tremendously so, about his windows all of the time, but particularly on all special occasions.



Sure he has his amusements and he goes to the "movies" too—BUT HE ATTENDS TO BUSINESS and once in a while he buckles down to good old fashioned (or better call it new fashioned) business ways, and collects the "coin."

No wonder he's got a handsome big car and a beautiful home. He likes nice things, BUT you can wager a mountain against a hillock that he worked for what he's got, and he's after your scalp, Mr. Bowler, as well as your customers—and by getting more customers he gets nearer to your scalp.

He knows you are out a great part of the time; that's just what makes him work all the harder. He's gaining on you in the business race. He heard you say that you "wouldn't work nights for anybody." That was his cue. Six months after he heard you say that he bought his fine big car and paid spot cash for it.

He heard you say that you "had all the trade in the neighborhood cinched." That very night Mr. Competitor put on more steam and decided he would pass you on the next lap and show you where you made a big mistake.

He started in right away to win the people by good

Any Up-To-Date Sign Painter Can Make the Background Design for This Window Display at Extremely Low Cost. An Attractive Window Is Always Worth the Investment.

Digitized by Google

service, attractive window displays, quick deliveries, telephone service and special attention to the social end in the right way.

All he is thinking about now is how to beat you in a

Make a Number of These Window Display Cards.

Christmas window display. Personally, he wouldn't harm a hair of your head or listen to anyone run you down, but it's the business game that he's playing for all he's worth. He's diverting the stream of dollars from your cash register into his own—THAT'S ALL.

He saw you yesterday, going into the moving picture show and he walked right home to work on another good idea for a window display. He spent an hour on a circular letter to send his customers—to send to your customers too.

You see, you keep him going, he knows that he is taking advantage of your false moves, and he knows that you still think you have the "neighborhood cinched."

Every time he sees you going into a pool room or into the theatre he feels just like Uncle Sam when he received the peace note from Austria—he knows he's "got you going."

Every time he rings his cash register he says to himself: "Oh, my, but it's a shame to take the money!" Every time his cash register bell rings, it peals your "death knell."

"Mr. Bowler," the income that would accumulate from the advertising display that your windows hand out wouldn't keep a man in a decent furnished room. I know these facts to be true. I've traveled from coast to coast. When a man hesitates to set his face against complacent customs and dig out for the broader view he lacks the courage that is so necessary to the advancement of his business.

I met an old friend of mine in Chicago not so very long ago, and while he had what he called a position, he explained to me that he was selling land—Western farms and orchards—and in that game we all understood that sales are not made every day.

This friend complained that he was waiting to close a couple of big deals and he was broke until he could make "a turn-over," when, of course, he would be on Easy street. He was so hard pressed that I insisted that he come and live at my home until he could accomplish the closing of some of the deals he had on hand.

At the end of a month he was still waiting and I was still feeding him and staking him to carfare. One Sunday morning I went out and got a full line of Chicago newspapers and announced the fact that Jack had loafed long enough and that I was going to get him a position. I spotted three good ads and answered them for him.

In Monday evening's mail there was an answer to one of the letters, and Jack went to see the man and got the position. The next Saturday night he came home with his wages. I laced it into him. "Jack," I said, "there are thousands of people just like you in this world and they are standing right in the way of other people. You're the kind that we shove aside so that we may pass by and get to our work."

Later on in the evening we were out for a stroll and I pointed out a store to him with the remark that that particular store had not had a change of window display in one solid month, and the man was a native-born—an American, and Jack was an American.

"There is some excuse for a foreigner with but limited capital, but no excuse, Jack," says I, "for you and that man—you both know the habits of the people of this country—what they like and what is progressive, and you're both asleep at the switch.

"Now I'm going to do something, Jack, and for awhile, anyhow, as long as I'm talking to this man, remember you're worth fifty thousand dollars and you're going to open a store right in the neighborhood, carrying the same kind of goods that this store is only half stocked with. I'm going to wake him up." We entered the store and Mr. Morton, the proprietor, advanced to meet us. I had talked to Morton before this several times on the subject of advertising and window displays. I thought best to start right in and give him the fright in one good, big dose.

"Mr. Morton, this is Mr. Jack Merkel. I want you to meet him because he is going to be a neighbor of yours. He's going to open that large store on the corner below here when the building is finished—in fact, all the papers have been signed and the goods ordered."

"What line are you going into, Mr. Merkel?" asked Morton.

Digitized by Google

"The same as what you carry, Mr. Morton, only I will have a more complete stock." Jack commenced to throw around that fifty thousand dollars like so much stage money. Before I had a chance to butt in again I had figured that he had got rid of that fifty thousand dollars and was working in another fifty.

Just then Mr. Morton had to wait upon a customer, and I told Jack quietly to cut out blowing so much money, that Morton might tumble that we were kidding him. "Well," says Jack, "I had to keep talking about the money end to keep him from asking me technical questions that I wouldn't be able to answer."

We continued in conversation a little while longer when Morton did pop over a technical question, but Jack pulled out cigars right away and the talk turned to tobacco, and from that to generalities, and we managed to get away without him getting wise to the fact that Jack had only worked one week in three months, but I guess that one week's salary must have felt to Jack like fifty thousand anyhow.

My object in "kidding" Morton was to wake him up for his own good. I am glad to say that the time was

well spent. Within five days Morton began to make alterations. At the end of a month he had an entire new front in, and the inside was entirely remodeled. In a year and a half he doubled his business. You see, Morton was just like Jack—he had to be *pushed*.

Morton nailed me one day in Chicago and wanted to know whatever became of Merkel and the fifty thousand dollar store? "Gee!" he said, "but you fellows had me worried!"

Then I told him that I merely knew that the oppor-

tunity was right there where he was and that an idea came to me one evening that he could be pushed into a more progressive way of doing business where he couldn't be coaxed.

"I wasn't pushed," says Morton. "I was scared into it. Why, that fellow you had with you bought half of Chicago in a few minutes, and when you were looking in one of the show cases he told me quietly that his aunt had just died and left him a half million dollars."

I always knew that Jack was a pretty good fabricator, but he must have been in extra good trim that night. A week's wages will work wonders!

So, boys, and readers, perhaps you must be prodded and scared into action, that's the "why" of this story. For goodness' sake, get busy, I've given you some ideas for window displays in this article, use them now and be "the early bird," don't wait until the "night before Christmas" and be caught asleep.

The Care and Repair of Bearings

Part 1—A Horse May be Only As Old As He Looks, But An Automobile Is As Old As Its Bearings.

BY J FRED GILMAN

HAVE you lost your bearings This question has nothing to do with a road map nor the absence of one, but to a more essential element for the automobile owner.

How long do you expect your new car to last? Two years? Three? Or do you know how long a car really ought to run? Very few persons do.

Automobiles are usually well built machines, yet the average life is only two years and a few months. Why? *Neglect*—that is the reason in one word. With the same care given machinery in factories, a car will run eight to ten years—and run better for that length of time than it has run during its present short life.

The owner is guilty of this neglect. He runs his car ten or twelve thousand miles and gives it attention only when it won't run any longer. Finally he sells or trades it in and gets exactly the value it is worth—"its junk value."

"Missouri stuff?" Well, I'll show you!

They say that a knock is better than a boost. That may be so where character is concerned, but when you're talking about an automobile engine, it isn't so at all.

A knocking engine is a heart breaker to any man who cares anything about his car and the fellow who doesn't care is usually driving somebody else's car. The man who hears the heart of his faithful engine throbbing like a steam riveter and does not relieve the congestion, would pull the arm off a baby.

There are not many automobile owners who know what a simple job it is to keep the car in maximum condition—to eliminate those little wreckers of efficiency—and keep the engine purring contentedly like it did the first day they "shot" up the street in it. They think it's hard, slow, dirty work. And so it is, and was, and ever shall be unless one knows the simple, sane way to go about it.

An automobile is only as good as its bearings. Whether these bearings be plain, babbitted or anti-friction, the value of the whole mechanism depends entirely on how carefully the bearing problem has been worked out and upon the type of bearing selected for its certain duty. The bearings must carry the load of the car. They must withstand the strains and stress of travel under all road conditions, and bearings, above all else, must be absolutely dependable.

A bearing may be defined as a support for a moving member, so designed as to minimize friction and receive wear and in addition to all this permit fine adjustment.

In the average six cylinder engine there are 96 bearings, six wrist pin, six crank pin, four main bearings, three camshaft, twelve cam, twelve push rod, twelve valve stem, two fan, two water pump, three oil pump, eight ignition system, six spark control, six carburetor control, four self-starter and four self-starter linkage bearings, totaling 96 bearings.

The crank pin bearings are usually in halves, the metal babbitt or bronze surrounded by a steel strap or casing. Adjustments for wear are made by taking out thin metal strips, called shims, which permit the halves of the bearing to be brought closer together. The main crank shaft bearings are of the same type.

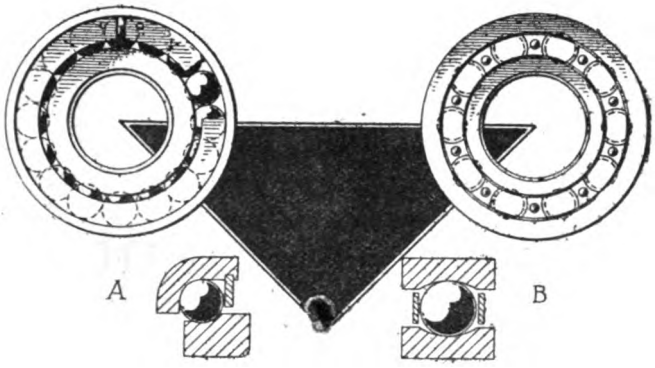
Cam shaft bearings are usually bushings which must be replaced when worn; cam follower bearings may be simple flat plates resting directly upon the cam, or rollers running on a pin in the valve push rods. Wear usually is compensated for by adjusting screws on the push rods. The push rod guides are sometimes made of cast iron or other metal, with babbitt or bronze shell in bushing form and have to be replaced when worn.

All the bearings mentioned in the foregoing are cared for by the engine's lubricating system but the following bearings require self oiling.

The fan bearings are of the ball type and lubricated by an adjustable grease cup and are adjusted by tightening the cone. Water pump bearings are lubricated by compression grease cups and when they are badly worn it is necessary to drive out the bushings and replace with new, and generally the shaft also needs replacing. If this shaft is worn out of round, no amount of tightening of the stuffing box will prevent water from leaking from it.

In the ignition system ball bearings are always employed and these with or without means of adjustment. These are usually packed with grease. The rocker arm of the interrupter, of certain makes, requires no lubricant while upon others grease or oil is necessary. This feature should be carefully studied before serious complications develop.

The carburetor air valve bearing operates better if not lubricated but of course will wear and will eventually need replacing. The throttle bearings may be lubricated and would wear longer if this was done frequently, but this bearing is usually forgotten. When it does wear, air is admitted which is noticeable at low engine speeds, causing skipping and irregular engine action.



The spark and throttle control have a number of bearings, which may be of the steel ball-and-socket type or perhaps only a wire bent to fit into an eye. These pins must be lubricated frequently with an oil cam. These

Digitized by Google

are not usually adjustable so the worn parts must be replaced by new.

Self-starter, motor and generator are equipped with ball bearings and are lubricated with an oil can. The other principal bearings are of the ball or roller type and full details are given in the instruction book which should be carefully studied.

In the steering gear there is a plain bronze bearing or

Two Types of Ball Bearings. A, Cup and Cone; B, Annular Bearing.

bushing in which the shaft is set out of center, so that when wear occurs, by twisting the bushing, the sector of the steering gear may be thrown deeper into mesh with the worm and take up whatever play is there.

In the transmission gear, in which all other bearings are of the ball or roller type, there will be found often a plain bearing on the forward end of the square or fluted shaft, called the pilot shaft bearing. When this bearing wears, the operation of the transmission becomes noisy and the gears very difficult to shift. The transmission must be disassembled, the bushing withdrawn and a new one pressed in.

The universal joints of the propeller shaft become very noisy when the bearings are worn. In modern construction these bearings are in the form of bushings, which may be replaced at small expense. The brake linkage has many bearings, which are clevis and pin. These are non-adjustable and should be oiled frequently.

To analyze the various types of the anti-friction bearings, one must first understand the difference between the two general classes; that is, those employing rollers and those employing balls to carry the load and reduce friction.

In the roller bearing, the load is supported along the entire length of the rollers, or along a line.

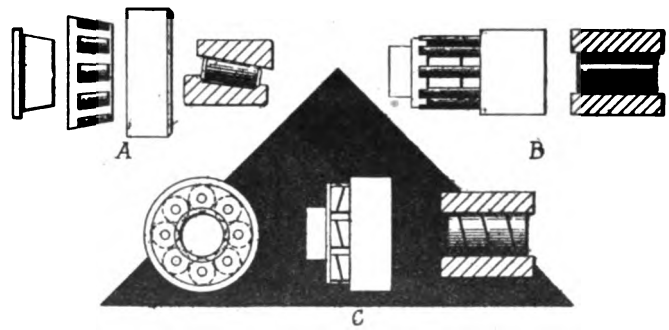
In the ball bearing it is supported practically on one point only. In other words, in the roller bearing there is line contact and in the ball bearing, point contact. Some ball bearings are provided with two rolls of balls, in which event there are two points of contact as against the line contact in the case of the roller bearing.

Two general types of ball bearings are in common use. In both of these types the point contact is typical of all ball bearings, hence at this contact point the surfaces are under enormous strain at all times. The cup and cone type are adjustable. It will carry a certain amount of side or thrust load as well as a vertical or radial load.

The annular ball bearing operates on a correct principle. Its carrying capacity is entirely a matter of the size of the bearing and of course the quality of the material used. This type is not adjustable for wear.

The tapered bearing, along with all other roller bearings, has the advantage of line contact or a generous load carrying capacity. This bearing is also designed to take end thrust and is made to be adjusted.

The parallel roller bearing involves the use of a flexible roller, introduces, however, entirely different conditions of operation and has many interesting advantages peculiar to itself.



After reading the foregoing, one's thoughts naturally turn to the problem of caring for the bearings.

Keep grit of all kinds away from the bearings, as it will quickly grind them down, the wear depending on the amount and character of the grit.

After the bearing has been removed from its package do not allow it to lie around on dirty benches and pick it up, covered with dirt and foreign substances. For this reason a bearing should never be removed from its package until it is ready to be installed in the car. If the bearings that are being removed or being put in the car are covered with dirt they can be cleaned very easily with gasoline or kerosene and this should be done in all cases where old bearings are removed from a car and before they are replaced. Clean gasoline always should be used in washing them.

The presence of small particles of grit or dirt in the bearing will cause it to catch or stick; it will not turn freely and smoothly as it should.

What applies to the bearings holds good for the housing that holds them. They should be absolutely free from particles of dirt. The threads for grease or oil

A, Components of Taper Roller Bearing; B, Solid Type Roller Bearing; C, Spring Roller Bearing.

cups should not be drilled or tapped out with the bearing in place.

Note that the grease or oil used is clean, as dirt is likely to be introduced in this manner. The balls must run over foreign matter like a stone crusher and if they fail to pass over the bearing will stick.

In replacing broken or worn balls in a bearing, no ball

Digitized by Google

should be more than .001 of an inch smaller than the others, never larger.

Another deadly enemy to bearings is rust and precautions should be taken to keep the bearings dry at all times.

Greases containing acids and alkalies also have a destructive influence on the bearings and the containers as it ruins the smooth, hard finish on which the life of the ball greatly depends. For this reason animal oils or greases should not be used as they become rancid in time. A neutral mineral oil or grease is the best lubricant for bearings. Also use a lubricant that will not become thin and run when the bearing is subjected to heat as trouble will naturally result.

Distortion of the ball retainers should be guarded against, and in removing or replacing balls the retainers should be handled carefully.

Replace all balls that are broken or have the appearance of being worn as soon as possible, as worn or broken balls shorten the life of the rest of the balls and the ball race.

(To be continued.)

War Time Advertising Important

Good-Will, Created Through Years of Effort, Must Be Safeguarded as the Most Valuable Asset of a Business

BY HON. WILLIAM B. COLVER*

DISCONTINUANCE or even sharp curtailment of advertising because of temporary war conditions would seem to imperil the most valuable asset that any business has—namely, its good-will. No more faulty logic can be found than that which would impel a manufacturer to cease building for the future by means of advertising simply because the output of his factory is, for the time being, restricted; or because diversion of his facilities to war work has operated to withhold his goods from accustomed markets. In modern business there can be no sufficient-unto-the-day policy.

In advertising the business man has built up the intangible or spiritual side of his business, if such it may be designated, as distinct from the material side. It is the spiritual side, as represented by good-will that is slower of growth and that is the more seriously jeopardized by neglect—neglect which could take no more disastrous form than an interruption to advertising.

For example, if I have the requisite capital I can build alongside the plant of the Columbia Graphaphone Company a factory equal in all respects to the Columbia manufactory. Assume that I can turn out an instrument comparable in every way to the Columbia product and in equal numbers. Yet I am not even a going concern. I cannot sell that instrument to the public in profitable quantities until I build up the good-will that the Columbia Company has acquired by years of advertising.

Good-will, in my estimation, is far more valuable than the physical property with which it is linked. The physical property is, in a measure, useless without the vitalizing spark of good-will. The Proctor & Gamble plant might be completely destroyed by fire, and yet the havoc would not extend to the commercial identity represented by the name Ivory Soap. Far from sustaining loss, the good-will inherent in the word "Ivory" would, if anything, be enhanced by reason of that trait of human nature which makes the public the more eager to obtain that which is denied to it or which is obtainable only over difficulty.

That, at times such as the present, there should be some hestitancy regarding advertising policy may be because it has never been scientifically determined what proportion of advertising expense is an operating charge and what proportion a capital charge. In my estimation, only a small part, if any, of advertising expenditure is properly chargeable as a current item of sales expense; but is, rather, when translated into terms of good-will, a permanent investment and hence a capital charge. Given this conviction, it must appear quite as short-sighted to discontinue advertising merely because the war has momentarily interrupted distribution as it would be deemed unwise of a manufacturer to junk a portion of his factory equipment because there had been interruption to its use.

The manufacturer who has converted his factory to war work and has therefore interrupted the production of his original line, does not tear down and discard his expensive machinery to save the insurance premiums or other similar expenses. It would be just as sensible for a manufacturer, whose commercial integrity is founded upon advertising, to abandon his advertising campaign in order to save the carrying charge on his greatest asset —good-will.

Many "Sales" Made Long in Advance.

Not the least of the considerations, certainly, that argue for the continuance without interruption of the advertising of all the concerns that will come back after

Digitized by Google

the war, is that sales are in reality made long in advance of the actual transaction that we commonly refer to as the "sale." This will be especially true in the war period.

For example, I have no doubt that, even under the normal pre-war conditions, thousands of persons who did not possess a musical instrument were sold on, say, the Chickering piano. They might be without means for the time being to carry out their determination to own a Chickering, or there might be other deterring reasons —for instance, a family might be planning removal to a new home, and therefore disposed to postpone purchase. The underlying fact in each such case is, however, that the prospect had absolutely made up his or her mind to some day own a piano and had come to the conclusion that the piano when it is purchased will be a Chickering.

Such anticipatory sales may not be precisely on a plane with transactions where an initial payment has been made, but certainly they do have a real value, and are a part of the intangible assets of the business. For the maintenance of such an asset, however, it is essential that there be reiteration and reminders in the form of continuous advertising that keeps alive the interest and the conviction of the prospect once won. Otherwise a competitor, with repeated well-told selling talks, will effect the mental sale and hold it. It would appear that the opportunities for thus, in effect, making sales for future delivery must be especially favorable during the war, when the barrier to immediate consummation of the trade is likely to be found not in lack of purchase price, but in inability to obtain delivery of the goods.

Seemingly the prospect who is converted by advertising under such circumstances is likely to be especially firm in allegiance. I fancy I hear him saying: "I may not be able to get Wesson's Oil now, but when I can get it I am going to have it." The more rapid turnover of money that has come to a considerable portion of the population incident to the war period is bound to encourage the planning in the present for purchase that will be made in the future, when stocks of goods again become available. I imagine I can hear many a citizen reasoning somewhat in this wise: "I have always wanted that set of Dickens or that Pianola, but I put off making the purchase, and now I can't get them. However, you can bet that as soon as we get out of this war mess I am going to act without delay and before anything else occurs to interfere."

Persistent Advertising Is Insurance.

There is scant justification, it would seem, for the misgivings of the advertiser who is prone to allow his investment in good-will to go by default merely because he suspects that popular demand or the conditions of distribution may undergo some radical change after the war. If a business man is basing his expectations upon an unworthy product he might as well abandon it once and for all. For the manufacturer, however, who has faith in his product there is every reason to have faith in the future and every incentive to take out insurance in the form of persistent advertising.

The form that this war-time advertising can take to best advantage is a question for the judgment of the experienced advertising men, who are familiar with the business interests whose good-will is to be safeguarded. The copy may take the form of good-will advertising, so-called. It may be explanatory of the Government demand, which, as in the case of "Bull Durham," curtails civilian supply. Or again, it might specifically aim at creation of after-the-war demand. If the responsibility were mine I believe that I would be tempted to try, in the present predicament, what might be termed tantalizing copy—messages that would provoke the damn-the-kaiser sentiment on the part of Americans temporarily deprived of articles on which they are, if anything, more solidly sold than ever before.

Dominating the minor considerations of ways and means is the big idea that an advertiser is justified, in the face of suspended animation, commercially speaking, in doing everything within his power to sustain his commercial integrity and preserve his commercial identity. Let the corporation with such an asset use its surplus, employ its undivided profits, or even borrow money to protect, by means of consistent and insistent advertising, that invaluable, intangible asset—good-will, which is the one thing that cannot be bought out of hand after the war.

They told me when I was a youngster that "even the Lord can't make a two-year-old calf in a minute." Big advertising spreads after the war will meet equally big spreads. Business will bid for public attention and interest on a bull market. The purpose will be to put a punch into the good-will that has gone flabby. The man who goes into that contest with a public attention and interest which he has never allowed to relax will go in with his good-will trained to the minute. He will win.

*Chairman, Federal Trade Commission. Reprinted from Editor and Publisher for August 24, 1918.

THE WHY OF THE SPARK LEVER.

Gas in an Engine Doesn't Explode—It Burns, and To Make Allowances for This Slow Combustion the Spark Lever Must Be Advanced.

By Jacques Mansfield.

THE enormous decrease in automobile manufacture caused by Uncle Sam's need of material and of the facilities with which automobile factories are equipped to turn out government work, has brought the car owner to a full realization of the possibilities of his old car; in understanding its mechanism to the extent of repairing and renovating it.

He is apt to regard its electrical system as a science appertaining exclusively to individuals of especially high mentality and assumes that without a prolonged tech-

Digitized by Google

nical education that he has no chance to comprehend its mysteries.

This state of mind exists with thousands of motorists who take an intelligent interest in the maintenance and upkeep of their car. While it is very true that no one knows just what electricity is, it is not impossible for any one to understand the working of the various electrical apparatus that is attached to the modern automobile.

When car owners know the first principles of this electrical apparatus, and the proper care of its important units and parts, they will find that it is not hard nor difficult, and what is more, they usually develop a pride in being able to keep their car in first class condition and in rendering "first aid" without depending upon mechanics or service men, besides realizing the help that they personally are rendering the government by lightening the load on garages and repair shops.

One of the most abused and misunderstood levers on an automobile is the spark control lever located on the steering column. The amateur driver retards the spark when starting the car and moves it upward when the engine starts running.

Why?

Simply because he has been told to do so. That it should be adjusted according to speed and road conditions, or even moved at all after once starting the engine is beyond his comprehension. He knows, of course, that this lever controls the spark and that the spark explodes the gas mixture in the cylinders, but just why it should be advanced or retarded is information of which most motorists have no knowledge. To know that economy, safety in starting and numerous other reasons depend upon its proper use should stimulate the car driver to familiarize himself with at least a slight working knowledge of the electrical system.

On a few makes of cars the spark is automatically set so that the driver controls the car with the use of the hand throttle or accelerator only, but the greater majority of cars today require that the spark be adjusted by a hand lever.

In ordinary driving the position of the spark lever need not be changed except for unusual road conditions, after it is once set to run through a considerable range of speed. This condition is best found by the driver adjusting and experimenting with the particular driving range adapted to that type of car.

In going up a heavy grade, nine out of every ten drivers "rush" their car for the simple reason that they are too lazy to shift the gears.

True, it is a grand and glorious feeling to be able to skim over the top of a steep hill like a bird, but just how long will your engine stand for this abuse before it begins to voice its disgust in numerous knocks and rattles?

Just how much rubber has been chewed from the tires as they obtained traction for that "rush"? And how much gasoline has been consumed in that "getaway"?

Of course, the automobile engine is an inanimate thing but it is nevertheless able to talk in its own language and constantly does so, even if it is not understood. The car owner, after driving for some time begins to understand this language and consequently any unusual noises are very noticeable. The noise should at once be investigated and interpreted as soon as it develops, for immediate attention may often prevent a burnt-out bearing or some other serious mechanical difficulty that may shortly incur a large repair bill.

When the engine is running at normal speed, the timing should be so set that the explosion takes place before the piston reaches the top of its compression stroke. The later the spark, the slower the speed of the engine and naturally the less power developed.

If the timing was fixed to fire the mixture before the piston reached the top of its compression stroke, in starting, the engine would kick back, and right here rests the reason for retarding the spark when starting the engine.

If it is necessary to retard the spark when starting the engine, it is also necessary to advance the spark in order to obtain more power. The piston moves so fast that it is part way down the cylinder before the explosion catches up to it and of course the real force of the expansion of the gas is lost. By advancing the spark the explosion occurs earlier and the full length of the power stroke is utilized.

This matter of advancing and retarding the spark while on the road should be used to advantage. On some cars the spark range is marked upon the sector while on others this feature is left to the driver's judgment.

The "knock" from an engine laboring up a hill is due to the fact that the spark occurs on the compression stroke and the explosion meeting the piston coming up tries to force it backward, thus producing a sharp, metallic thump. This "knock" would not occur on a level road unless the car was loaded, for the crankshaft is turning so rapidly that the piston has time to pass dead-center and start on the down stroke before the pressure of the explosion is at its maximum. At all times the spark should be kept as far advanced as possible without causing the engine to "knock," for a low set spark tends to heat the engine and also to reduce its power.

One of the best ways to learn the proper use of the spark lever and also to drive a car properly, is to drive at a steady speed no matter what road conditions are encountered, continually watching the speedometer hand to see that it maintains a constant reading throughout the test, regulating the spark and throttle and shifting gears when necessary. In this way considerably more can be learned about the flexibility of the engine and the use of the spark than if one drove many times in the ordinary way.

Salvaging an Old Engine

Second Installment of the Article Dealing With the Rescue of a Deceased Patient

BY W. O. MANN

THE remaining crankshaft bearing, which was babbitted, was so far gone that it looked serious. There had been originally a sixteenth of an inch of babbitt all round. At some period the engine had apparently been run without oil, and the babbitt had become hot enough to move around and get into terrible shape, incidentally covering up the big oil-hole into which lubricant from the crankcase was splashed. There was nothing to do

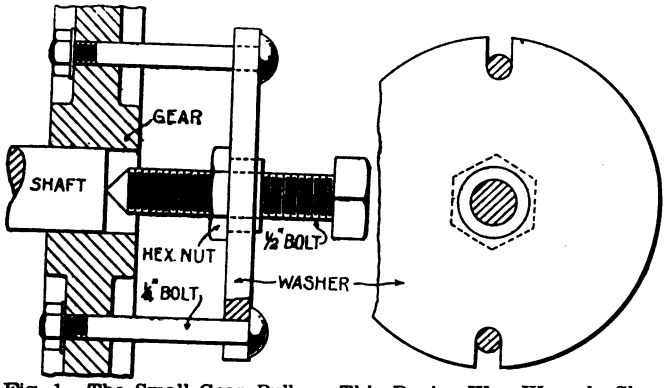

Fig. 1.—The Small Gear Puller. This Device Was Wrongly Shown in the First Installment.

but melt out the old soft metal and scheme some way of re-lining. Luckily the shaft had not gone through the babbitt at any point and so was not damaged.

A Main Bearing.

A new bearing surface was provided in the following manner. A piece of brass tubing was found that was just a shade smaller than the shaft—a piece of shafting would have answered just as well, but the tubing happened to be at hand and saved the situation. A piece of one-inch hardwood was very carefully surfaced on one side, a straightedge being used to get the surface as true as possible in every direction. A hole was bored in the middle, into which the tube fitted tightly, and the tube was very carefully squared with the trued surface of the wood, so that it was at right angles to it on all sides; little wooden wedges dipped in shellac held it firmly.

The bushing was slipped over the tube, flange down, and held in position by four screws, the heads of which came down on the edge of the flange. The position of the bushing was determined with care by calipering it. The inside of the bushing was rough and so could not be used for this purpose, and, anyway, it was so close to the tube that there was no room. So the calipers were placed against the outside of the bushing, which was machined, and the inside of the tube.

After a good deal of rather exasperating work the bushing and the tube were concentric and the former was made tight. Previously the inside of the bushing had been cleaned and tinned with ordinary solder, so that the babbitt would stick. See Fig. 3.

While the babbitt was melting a torch was turned on the bushing and the tube, which were gradually heated up until the point was reached where the wood block began to scorch, which was about as far as it was safe to go. Then the babbitt was poured in. Because of the narrowness of the space this was a mean job; much more was spilled than went in. The metal did not run down well and it was poked down with a piece of heated wire and the torch was kept playing on the sides so the babbitt would keep hot and settle down and fill the space.

The result was very satisfactory. The lining was good, only a few little seams showing where the run had been poor. Probably a better and quicker job could be done by arranging a sort of funnel or flange, as shown in Fig. 3, at the top of the bushing to hold a considerable body of melted metal and the metal forced underneath into the space; that's the way it's going to be done next time, anyway. By the way, it should have been stated that the brass tube was heavily smoked by means of a common candle, which prevented its being immovably held in the babbitt.

The bushing was put in its place in the crankcase and the shaft worked into it by degrees. The outer end

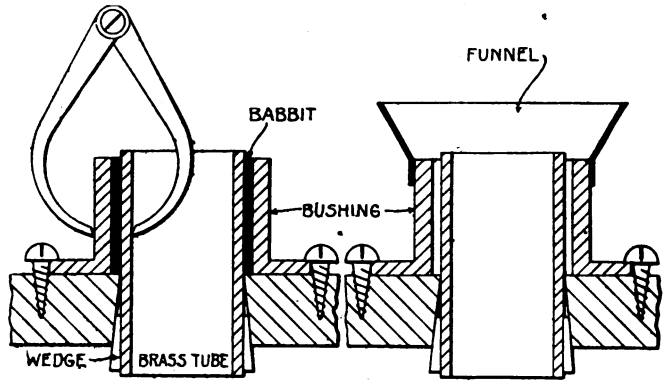

Fig. 3—Jig for Rebabbitting the Main Bearings.

of the journal—that is, the part of the shaft that runs in the bearing—was just a trifle rounded, so that it was possible, by twisting the shaft, to force it in a little way at a time, easing the hard spots with a round-nosed scraper as the process went on, until finally the journal was all the way in and a very tight fit. After that it was simply a matter of marking with red lead and scraping until an exceedingly good bearing was obtained. In fact, one could hardly have wanted a better

Digitized by Google

job—and it cost merely quite a bit of time and the price of a pound of metal, which was in the shop anyway.

Cylinders Not Badly Worn.

A careful calipering of the cylinders came next, and this revealed that all four were worn just a little oval, though the surfaces luckily—very luckily, considering the way the poor old engine had been starved of oil—

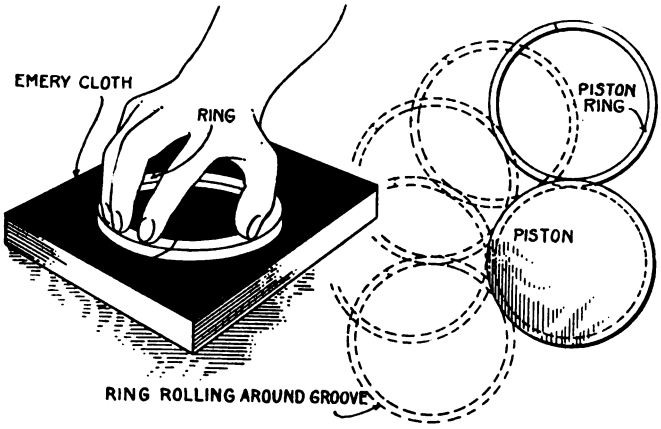

Fig. 4—Fitting Piston Rings.

were perfectly smooth and glassy. Naturally the pistons were also in good shape, and hardly worn at all; but the rings, as has been stated, were simply impossible, so it was decided to part with the price of a new set.

Here a question arose. Oval cylinders and piston rings of the ordinary type do not work well together. In time the rings will wear to fit, if the eccentricity is not too much, but it takes time, and in the meanwhile the compression is bad. Furthermore, once the rings are worn in they must be kept in absolutely the same positions, or there will be no compression worth mentioning.

So a ring* was used that is so made that it will expand more in one place than another and so exactly fill a distorted cylinder bore. It was of the three-part type and, to make a long story a little less long, it did the business, holding compression remarkably well even when first put in—which is saying a good deal.

It happened that the rings were a shade tight in the grooves. This was remedied by running the rings down to fit the grooves, placing them flat on a sheet of very fine emery cloth and polishing them down until they entered the grooves easily but without play. See Fig. 4. In doing this it is not necessary to expand the ring over the piston and put it into the groove, to try for size. The fit can be ascertained by simply rolling the ring around in its groove as one gear rolls on another. The greatest pains must be taken to wash away all traces of emery after the job has been finished.

This much done, it began to look as if the big jobs were over and the rest were simply ordinary adjustments and so on. "But it is to laugh," as the French say. The taking up of the connecting-rod big-ends was tackled next, and their adjustment was made easy by replacing the old solid shims with laminated brass shims, from which thin layers were peeled one at a time until the desired thickness was obtained.

But it turned out that the crankpins were worn oval, the varying pressures causing varying wear at different points, so that when the rod was made perfectly tight at one point it was so loose that it would shake at another. Of course the big wear comes where the initial pressure of the explosion forces the rod against the pin.

Here was a poser. Running with the pins in that condition was utterly out of the question, and yet the alternative of sending the shaft to a machine shop and having them trued up was not to be considered if it could possibly be avoided. It was avoided.

The pins were ground true with valve-grinding compound. Of course it was out of the question to use the bushings for the purpose, so the bushings, which were of babbit and removable, were taken out of one of the connecting rods and a special bushing cast of babbitt, using the big end of the rod for a mould and a piece of brass tube for a core, the tube being of about the same diameter as the crankpin.

This bushing did not need to be at all accurate. It was split after cooling and the surfaces for half an inch from the split relieved, so that only the top and bottom would rest on the crankpin. See Fig. 5. The rod with its new bushing was adjusted to the pin with shims precisely as a regular adjustment is made, except that it was considerably too tight for running. Then it was taken off, coarse valve grinding compound smeared on the babbitt surfaces, replaced and tightened up.

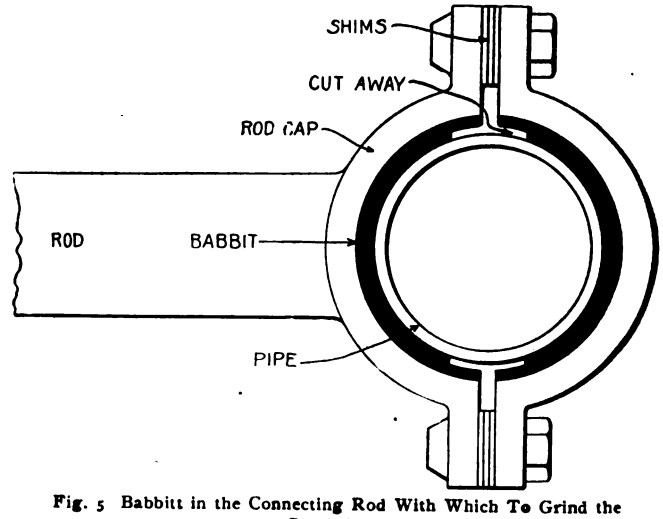

Fig. 5 Babbitt in the Connecting Rod With Which To Grind the Crank Pins.

Then the rod was worked back and forth, back and forth, back and forth, over the tight places, until they gradually came down. It was necessary to put on fresh compound and remove shims several times for each pin. One pin was a good deal worse than the others, for some reason, and it seemed as if the grinding process never would reduce the high spots. So they were very cautiously dressed with a dead smooth flat file.

It is worth noting here that some files are not per-

(Note: The rings used in this case were the "Ever-Tight.")

Digitized by Google

fectly straight across, but are slighty curved—either concave or convex. Such a file will make trouble. See that the surface is flat, and it will leave the pin in proper condition. After getting the worst of the "humps" off with the file, grinding was again taken up, which brought the surface down smooth and removed the irregularities which cannot be avoided in filing such a job.

When the rod could be moved in a complete circle without being tighter at one place than another a final finishing was given with the finest grinding compound, the pin washed and rubbed absolutely clean and the regular bushings adjusted.

In order to avoid grinding grooves and scores into the pin the grinding bushing was made narrower than the regular bushing, which has a flange and is wider than the connecting rod itself by the width of the flange. The grinding bushing, having no flange, could be moved almost a quarter of an inch lengthwise on the crankpin, and by keeping it moving pretty constantly the surface was kept perfectly smooth and free from scratches and grooves.

The only danger in doing a job of this sort is that the pin may be ground out of parallel with the shaft. To avoid this it is necessary to avoid putting side pressure on the rod when working it back and forth, and to see that the bushing is always put into the rod—that is, the grinding bushing—in the same position, so that it keeps itself true.

When filing is necessary it is simply a case of care, plus knowing how to use a file. If only a very little is removed it is not likely that the pin could be damaged because the part not filed acts as a guide and tends to bring the rest into line. If there is much to come off, the greatest care is needed in filing. It is true, however, that excellent results can be obtained even when a pin is badly worn.

An Oiling System "Stunt."

So far as the rest of the work was concerned there was nothing difficult about it, for the most part. A number of little stunts were done that helped, however. For instance, the oil pump took oil direct from the bottom of a sub-base without a strainer, and anything that got into the oil would simply go on circulating until it had worn itself out and done all the damage it could. So a fine-mesh tea strainer was bought, the handle taken off and the bowl soldered over the oil pipe intake, as in Fig. 6.

The drain-plug at the bottom of the sheet steel oil pan was very unsatisfactory, for the gas-pipe fitting into which it screwed projected nearly quarter of an inch up into the pan, making it impossible to completely drain off old oil and sediment. This was removed.

The bottom of the base, around the hole, was tinned, as was also the shank of an ordinary drain-cock, which was then just started in the hole—enough so that it would stay in position. Then a ring of mud—not even clay, just mud—was built around it and the space filled with molten babbitt which was afterwards trimmed neatly. The drain opening was thus lower than the bottom of the pan. Both these wrinkles have proved very satisfactory.

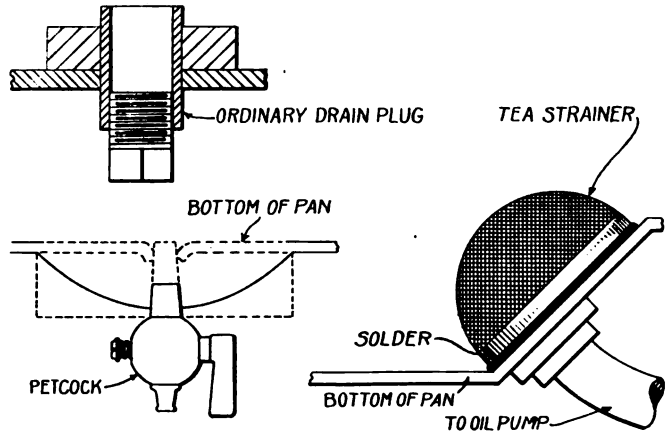

Fig. 6—Replacing the Drain Cock with a Petcock and Showing How the Oil Pump Was Fitted with a Strainer.

MOTOR LORRIES IN ENGLAND.

Motor Trucks Have Been Used in England Longer Than in This Country and the Merchants Cannot Carry on Business Without Them.

BY SYDNEY F. WALKER, M. E.

SINCE the shortage of gasoline, tradesmen's and manufacturers' vans and lorries have been run on kerosene with considerable success. Most of them were run on gasoline before the shortage, and have been converted to kerosene by the aid of one of the vaporizers that were described last month in the Automobile Dealer and Repairer.

The following is a list of some of the trades in which motor vans and lorries are employed: Delivery vans, and lorries used by the railway companies; by bakers, millers and corn merchants; by drapers; by grocery, sweetmeat and kindred trades; furniture manufacturers and dealers; express carriers; laundries; manufacturing chemists; mineral water manufacturers; paper manufacturers, the textile industry; wine and spirit merchants; engineers, and others.

The engines are usually of four cylinders; in a few cases, the larger ones are of six cylinders; they usually are run at 1,000 revolutions per minute; the sizes of the engines range from 3½ inch bore by 5½ inch stroke, up to 5 inch bore by 6 inch stroke, and the H. P. ranges from 20 up to 50. The power is delivered to the rear axle, in some cases by cardan shaft, and worm gear; sometimes by cardan shaft and bevel gear, and sometimes by chains.

The frames of the cars are made in some cases from pressed steel, usually of channel section; in a few cases of nickel steel. The gear wheels are nearly always of

Digitized by Google

nickel steel, and give three speeds forward and one reverse; in a few cases, four forward speeds are given. The lubrication is partly the usual splash from the crankcase, the big ends carrying dippers and partly forced by the aid of an oil pump. The wheels are usually of steel and sometimes have solid rubber tires, sometimes steel tires, the wheel in the latter case being all in one.

The cost of running motor vans and motor lorries has, of course, increased enormously since the war, and no reliable figures are available for the present time; there are plenty of figures, however, of costs taken just before the war, and it will not be a difficult matter to estimate what the cost is likely to be after the war. Before the war the price of gasoline in the United Kingdom was 36 cents per gallon, while that of kerosene was only 16 cents. The following are the costs of commercial vehicles, taken from the different trades mentioned above, and with different loads, ranging from 12 cwts. up to 5 tons.

All the vehicles have been found to be able to make journeys ranging from 300 miles per week up to 420; and the cost per ton mile with a 12 cwt. vehicle loaded both ways ranged from 15.0 cents down to 12.6 cents; when loaded only one way, the vehicle returning empty, the cost per ton mile ranged from 28.8 cents down to 25.2 cents.

With a one-ton vehicle, the cost per ton mile loaded both ways ranges from 8.6 cents up to 10.1 cents; and the average cost steadily decreased as the size of the lorries increased, till with a 5 ton load it ranged from 3.15 cents to 3.8 cents.

The above costs are obtained by taking the actual costs running with gasoline, and allowing the difference in fuel cost when running with kerosene; the difference in fuel cost, allowing for the lower cost of kerosene, its lower calorific value, and the other points that have been mentioned, may be taken as 50%; the fuel cost of running with kerosene is half that with gasoline; and this applies to nearly every kind of vehicle.

In the costs given above tire depreciation, lubrication; depreciation of the vehicle at 15% per an. without tires; maintenance, that is to say, repairs; insurance, drivers and storage, are all charged. The insurance ranges from $1.50 to $1.75 per week; storage, uniformly at $1.25 per week; driver, uniformly at $8.75 per week; tire depreciation, $5.00 per week, up to $16.00; lubrication, 75 cents per week up to $1.50; repairs, etc., $2.50 up to $7.00.

The following particulars of the deliveries of a 12 cwt. van in Glasgow may be of interest. In three hours the total distance traveled was 23 miles; running time and stopping time 1½ hours each, 16 stoppages being made of from 1 to 43 minutes.

It is not easy to obtain the figures for horse haulage, as users have not often taken the trouble to get them out; but the figures obtained from the manager of a Co-operative Society covering a very large area, serving a large colliery district, show a saving of 6 cents per mile traveled in favor of motor transport, where with horse haulage, three pairs of horse vans were employed with only one horse in reserve. With a 2 ton lorry a saving of 5½ cents per ton mile is shown.

The manager of the Co-operative Society reports also that by the aid of motor vans and motor lorries he had been able to increase his turnover by $320,000 in six months.

It should, perhaps, be mentioned that co-operative societies exist in the United Kingdom in every town and in every industrial district, particularly in the colliery districts; they are established and run principally by working men for working men.

The principle upon which they are run is, goods are sold at as low a figure as possible, and all profits, after paying working expenses, are divided among the members. Some of the societies, particularly one having its headquarters in Manchester, and another with its headquarters in Barnsley, the center of the principal Yorkshire coal field, do a very large business, indeed, wholesale as well as retail; the large establishment in Manchester manufactures a great deal of the goods supplied and distributes them to branches established in towns and villages extending over a very wide area, at least 50 miles from the center; the branches also make and distribute bread, deal in milk, coal, and practically everything that is wanted in the home for food, warming or clothing. It will be seen, therefore, that praise from one of them is praise indeed; they are out to save money all the time.

THE AUTOMOBILE IS NOT A PLEASURE CAR; IT IS A VITAL WAR ESSENTIAL.

WHY is it that the Government still persists in the idea of classifying the automobile as a luxury, which must submit to suppression or something approaching it. Can officialdom never realize that the automobile has supplanted the horse-drawn vehicle in every farming community as well as in the cities? Farmers now use motor cars where horses were formerly employed.

The great farming State of Iowa is said to have a motor car to every 14 of its inhabitants. To call the auto industry a non-essential is as ridiculous as it would be to call the horse-drawn vehicle industry non-essential, and no politician would probably dare to do that—unless he was tired of his job. Farmers everywhere are using automobiles where formerly they used horses.

Do you hold your head erect, breathe deeply, and look every man in the eye? If you do, you are well and happy. A man who doesn't pay his bills promptly or who has continually to take a cross street to escape a creditor, is never ready to look people in the eye.

The Pulse of the Electric System

Every Instrument on the Dash Board Is There For a Purpose, Keep Yourself Informed As To the Reason.

BY WM. H. STEWART, JR.*

IT certainly is funny, but the average motorist today does not use either his ears or his eyes, especially the latter, although he is not entirely to blame. He has not been brought to the realization that his automobile is a complicated mass of machinery. Manufacturers have always aimed to make their machines as simple as possible. "Foolproof" is a statement which many of them make.

Let me explain what I mean by my statement that the

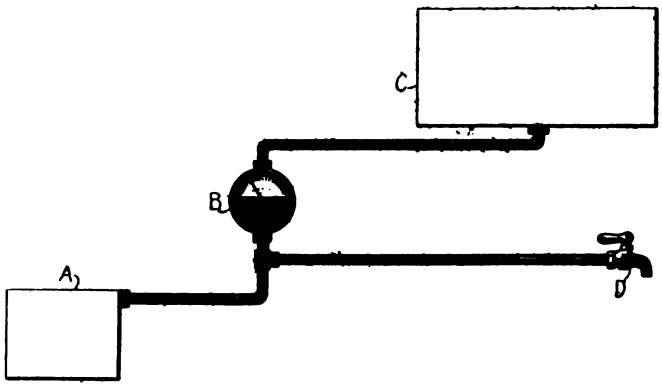

Fig. 1.—Water System to Illustrate Electrical Generator, Battery, and Line.

motorist does not use his eyes. Upon the dashboard of nearly every machine now being manufactured is a little device called the ammeter. This ammeter is to the motorist what the barometer is to the weather man, what to the mariner. It tells the automobilist just what is the caliper is to the machinist, and what the compass is going on in the electrical system. It tells whether the generator is functioning properly, whether the battery is receiving its proper amount of current, how much is being used by the ignition system or the lights, and whether or not there is a fault in the wiring.

If I may use the term, it is the "pulse" of the electrical system, and the electrical system is the nervous system of the automobile. Let me tell you what the ammeter is for, and what it does, then I trust you will use your eyes in the future because you will realize how valuable this little device is.

First let us trace the current when the ignition unit is being used. The current passes from the positive terminal of the battery to the ammeter and thence to a junction box or the ignition switch. From the switch it goes to the ignition unit and through it to the frame or a second wire back to the battery.

If lights are in use, current for them also passes through the common wire from the battery to the ammeter, thence to the switch, then the lights and back to the battery.

No matter whether the positive or negative battery pole is grounded, the path of the current is the same, it only runs in a different direction. At any rate, the point brought out is that all of the current used for lighting or ignition must pass through the ammeter before it is distributed to the various units.

When the Cut-Out Closes.

With the engine in operation at car speed of above fifteen miles per hour, current is generated in the dynamo or generator and passes through the cut-out to the ammeter and thence to the battery, then through a wire or the frame back to the generator. When the car speed is below 10 m.p.h. or when the generator is idle, this circuit is broken automatically by the cut-out, so that no current can pass back to the generator from the battery. All of the current generated, then, must pass through the ammeter also; but in the *opposite direction* from that used by the ignition and lighting system.

The ammeter indicates in which direction the current is flowing. It has a center zero mark usually, and when current flows from the generator into the battery the needle is deflected in one direction and indicates "charge." When the engine is idle and lights are used, the needle will indicate "discharge," because current is being used from the battery.

Let us consider, for a moment, a water system comprising the corresponding units of a water pump, a meter,

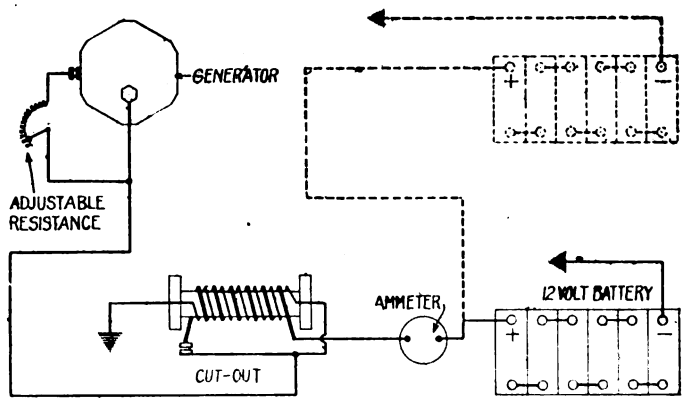

Fig. 2.—Simple Wiring of Generator, Cut-out, Ammeter and Two Sets of Batteries.

a tank and a faucet. The layout of such a system is shown in Figure 1 and consists of the pump A, compared with the generator of an electric system; the meter B, compared to the ammeter; the gravity tank C, compared with the storage battery; and the faucet or outlet D, which represents the lighting or ignition system.

Digitized by Google

With the faucet D closed and the pump A in operation, the meter B will indicate that water is passing into the tank C. With the pump at rest and the faucet D open, water will run from the tank through the meter, which will register backward or "discharge," to the faucet.

Comparison With a Water System.

Now suppose the faucet is open and the pump in operation; if the pump supplies more water than is being drawn through the faucet, then the meter will indicate water passing into the tank. In other words, the meter will show the excess amount supplied by the pump and not being used. So it is with the electrical system. The ammeter tells how much current is going into or running from the battery.

In a well-balanced system the generator furnishes just enough current to supply all of the lights and the ignition system with no excess. This current is usually from eight to ten amperes and is had at about fifteen miles per hour car speed.

The ignition system (after starting) requires approximately two amperes, dash and tail lights two amperes, head lights from two to three amperes each, and the dimmer lights from one to two amperes each. The starting motor current is not carried through the ammeter.

It is an easy matter, then, to locate trouble in the system by considering these figures. Suppose the engine to be idle. Turn on the dimmer bulbs and note the ammeter reading. If it is more than three amperes discharge it indicates trouble on the line, either a short circuit or a grounded wire.

Next turn on the tail and dash lights and note the reading. Do the same with all of the lights and be guided by the readings. Then start the engine at a low speed, and with all the lights off the reading should not be more than three amperes. Note, however, that the ignition system may take as high as seven or eight amperes when first turned on with the engine idle. This is important and one can see that the ignition switch should not be turned on until ready to start the engine.

With all of the lights off and the engine running at low speed the ammeter will register discharge. When the engine is operated at a speed corresponding to from 10 to 12 miles per hour car speed, the ammeter will begin to register charge, and this reading will increase with the engine speed until it reaches its maximum, depending upon the make of car. As a machine is operated mostly during the day, the battery will be charged steadily and will only be drawn upon during the evening, and then only in proportion to the amount of current furnished by the generator below that necessary to supply the lights.

If you watch the ammeter, then you can tell whether there is a short circuit in the system; whether the generator is doing its part; if the lights are using too much current and if the cut-out is working properly. The ammeter is put there to be consulted—do so.

*President Stewart Automobile School.

Tools That Mississippi Garagemen Use

The Garagemen in the South Have Been Hit by the Draft and Are Replacing Men with Machines.

BY JAMES F. HOBART, M. E.

GARAGES and automobile repair shops are not usually burdened with more tools than are needed, but occasionally a shop is found where there is a machine or tool for most any kind of repair work that is ever likely to come along. In a Mississippi shop, the same one which had the boxes for auto parts, described in a recent issue of this journal, the writer saw as fine a little bench lathe as ever graced the shop of a model-maker.

It was a most complete little screw-cutting lathe, with all the appliances and fittings which go with such tools, including chucks, light grinding and boring attachments, a taper attachment, and last, but not least, an overhead grinding roll. This was a plain roll, longer than the lathe bed, and mounted in bearings of its own, directly above the lathe.

A very small motor, one which was almost a toy, seemingly, and which would rate about "one cat power," was arranged to drive the roll at quite a high rate of speed. The use of this roll was to drive a small grinding wheel which was placed upon the tool post of the lathe, same as an ordinary tool is there fastened. The object to be ground would be placed between the lathe centers in the usual manner and revolved at a slow rate of speed, while the grinding wheel was traversed along the work by means of the regular rod feed of the little lathe.

Many lathes are used for grinding, although it is said to be pretty tough on the lathe V's which may be worn badly by the grinding wheel dust, but most lathes use a grinding wheel driven by a direct connected or built-in little motor which is placed in the tool post same as described above. But the vibrations of the heavier motor may cause the grinding wheel to vibrate too much, hence the liking of fine lathe workers for the overhead roll for speeding up the grinding wheels.

A Welding Bench de Luxe.

A bench for oxy-acetylene welding, in use in the shop above noted, is certainly a bit of very useful luxury, and beats both "going and coming" the fashion of welding upon the floor or upon a brick pavement. As shown by Fig. 1 the bench is made of angle steel, some tank steel

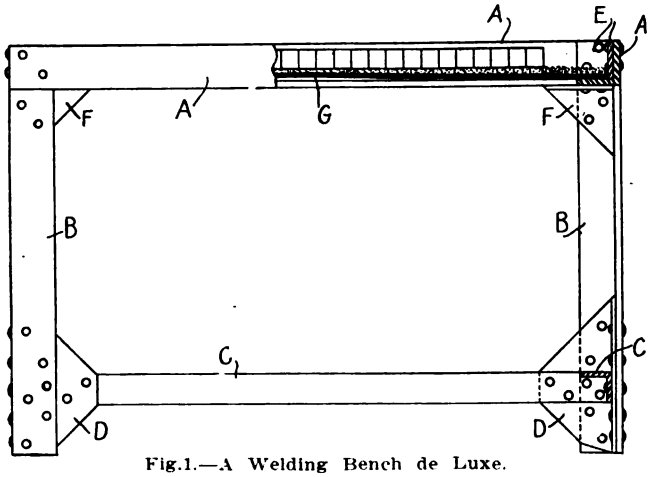

Fig.1.—A Welding Bench de Luxe.

plates and a few fire bricks. Common bricks will answer pretty well if fire bricks are not available.

The top of the welding bench was made up of a frame of angle steel with the corners mitered together and fastened by means of angle pieces riveted inside of each corner. These sides are shown in Fig. 1 at A, A, and one of the corner irons is shown at E. The legs are four plain pieces of angle steel, cut square at each end and fastened to the top frame by an "angle gusset" sheet at each corner, one of which is shown by F, Fig. 2. The leg B and plate F taking the same reference letters as in Fig. 1.

The legs are further stiffened by girts C, C, four of which are used as shown. These girts are fastened to the posts B, by means of triangular plates which hold the frame securely against "racking," and therefore act as very effective braces as well as connecting plates between legs and girts.

The inside of frame A, A, is covered by a plate of cheap tank steel about three-eighths of an inch thick. Thinner metal would have answered but the man who built this bench wished to have it solid enough to carry almost any load without "sagging" down in the middle. Therefore, he watched his chance and procured a piece of tank which was being broken up. The bottom of the frame was cut out in a few minutes with an oxy-acetylene cutting torch.

A "Bumped-Up" Bottom.

To still further prevent, or to prevent the bench from sagging under loads of heavy castings which might be placed together for welding, on top of the bench, the steel plate was "bumped-up" in its center, G, for about an inch in height. To do this, the plate was placed flat on an anvil and held there securely while two men with sledges played a tattoo on the upper surface of the plate as it laid fair and flat upon the anvil.

The effect of thus hammering the plate while laid and held upon a solid surface, was to stretch the middle of the plate (the edges were not hammered), they remained the same, which jumped up to make room for the increased surface area.

Care was taken that the plate "puffed" all on the same side and when the center had been dished a little more than an inch, the plate was turned upside down and laid inside of the bench frame.

A little more hammering was necessary to make the plate lay fair upon the sides of the frame but this was finally accomplished, then some fine dry sand was placed on top of the plate and the brick paving laid in place and well rammed down. The bench was then ready for business, and castings, broken into two or more pieces could be placed together upon the brick paving, wedged up into position for welding.

A bit of a "cob-house" built around the parts to be preheated, using bricks therefor, then the heating would be done, the bricks carefully removed as necessary and the welding done, without moving the casting from its position, at least not until the several parts had been securely "tacked" together by the oxy-acetylene flame and were practically one piece again.

Individual Motors and Lights.

In the shop where the welding table was used, there was, besides the bench lathe, one which would swing 20 inches, a fine tool, capable of doing about anything which any lathe could handle. They also had an air compressor of large capacity, big enough to supply air as fast as it ever could be used in that shop. As the compressor was large, only a comparatively small storage cylinder had been provided. As the compressor and all the other machine tools had each been provided with an individual electric motor a large air storage capacity was not necessary.

But, as stated, each and every machine had its own motor, the drill had one, and even the little bench drill

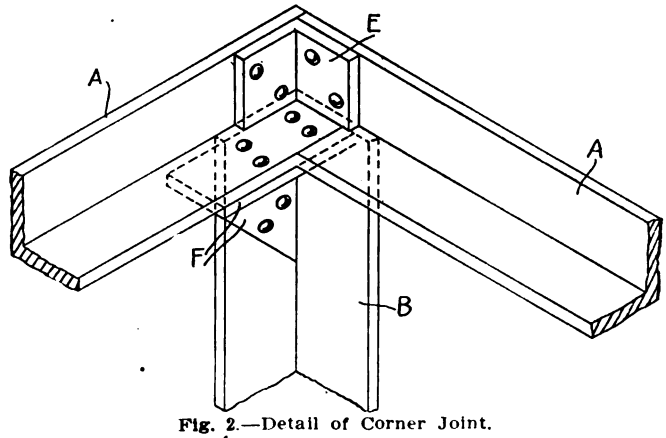

Fig. 2.—Detail of Corner Joint.

was driven by a small motor and had still another motor for driving the overhead grinding roll as mentioned above.

A peculiarity of the electric light arrangement in this shop was that in addition to the usual overhead and wall lights there was one incandescent lamp at each machine,

Digitized by Google

attached to the end of a stout "flexible," which was so arranged that the lamp was normally kept right where it was at all times convenient to the hand of the machine operator.

For instance: One of the lamps was hung to the belt shifter of the 20-inch lathe; another lamp hung from a hook which had been fastened securely to the drill press housing through which the drill spindle moved. The lamp at that point could be grasped by the fingers of the left hand almost instantly, removed from its hook, carried to the point where light was needed—"badly and P. D. Q.;" then the lamp could be as quickly returned to its hook again. These lamps were all enclosed in wire cages so they might be laid down anywhere, on floor or on the work, as required.

Service Work.

In this shop they made a specialty of service work, and their superintendent, Mr. A. Hulman, submitted that commercial cars particularly were their aim and "hobby." "It is a fright," said Mr. H., "how some—yes, how many, and even most of the commercial cars—are run. They are sent out in any old condition, and it seems as though the owners were perfectly satisfied as long as the cars will run. Just as long as the engine will turn over, nothing is done to the machine, and the rattling abominations heard on every hand in our business streets are the results of commercial car neglect, or, perhaps I should say, lack of care.

"There is no reason why each and every commercial car should not run as quietly and as noiselessly as a passenger car—no reason save the neglect to keep the mechanism in proper condition to run quietly. Now, we

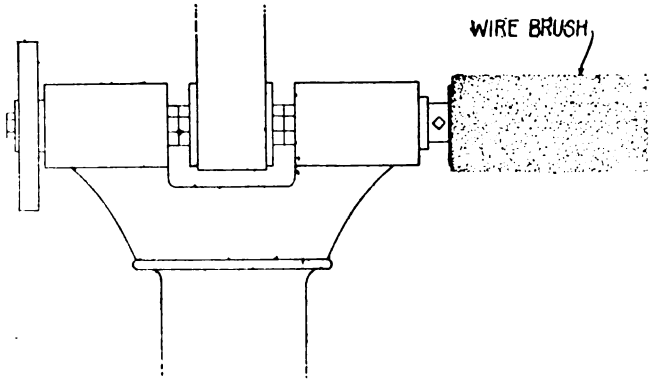

Fig. 3.—A Wire Brush Is a Great Utility Machine.

propose to take care of commercial vehicles the same as other garages take care of passenger cars, and to see that cars cared for in this garage will run with 'decency and quietness,' as the old lady said about the college boys."

Life of Commercial Vehicles.

"Commercial cars wear out too fast," continued Mr. Hulman, "just because the cars are not properly taken care of. The cars which are cared for in the Commercial Service department of this garage outlast any of the cars which are running around without service attention, and users of commercial cars are beginning to sit up and take notice of that fact. We have demonstrated the fact to them so strongly that there is no getting away from it, and I venture to state that within a very few years commercial cars will all receive regular service work, and that the city authorities will awaken to the fact that a rattling commercial vehicle is a nuisance and an unnecessary one at that, which will be fined or otherwise penalized whenever or wherever it may appear in public to the discomfort of our fellow citizens."

The Useful Wire Brush.

One very uncommon tool to be found in a garage was a revolving wire brush. This tool, which was about 10 inches in diameter, was placed upon the spindle of an ordinary grinding double wheel stand. One of the grinding wheels had been removed and the wire brush put in its place. The uses found for this very convenient tool were many and varied. Daily new uses for it were constantly coming along, and the revolving wire brush bids to be the most popular machine in the shop.

For removing a bunch of dirt or a patch of rust from a bit of machinery, the revolving wire brush will accomplish as much in five seconds as a man can do in fifteen minutes with scratch-brush and scraper! The effective and speedy manner in which the wire brush will do its work must be seen to be appreciated.

Supply Room and Office.

This garage has worked a scheme which is particularly well adapted for use in warm localities, but which may also be used to great advantage in snow and zero places as well. It is usual, in garages and shops, where store rooms and offices have been partitioned off, to find the spaces thus set aside to be so warm and ill ventilated that it is only with great discomfort that anybody can stay inside the stuffy places thus isolated.

But in this Mississippi Garage there were no ill-ventilated places where the temperature seemed high enough to spoil a rubber tire or to cook an egg. But, all the same, the required spaces were partitioned and even securely locked, without stopping in the least the circulation of air, light or heat. The partitions were made in the usual manner, of scantling, 2 x 4 inches and 4 x 4 inches, spaced fairly closely together, with one laid upon the floor, another placed against the ceiling, with the necessary number of studs and girts cut in between.

But, right there, the usual procedure stopped. Instead of being covered with sheathing, the studs and girts were covered with wire cloth, of a variety resembling "poultry" netting, only the wire seemed to be stouter and stronger—better able to withstand rough usage. This partition material let light, air and heat pass readily, and furthermore, things could be seen and heard without going into the rooms which might have been partitioned off.

Beneath the Dollar Sign

He Who Can Laugh at His Own Misfortunes and Smile Away His Griefs Can Always Keep His Wallet Filled.

$$$

A camel can go eight days without a drink but remember your radiator is not built that way.

$$$

Possibly you can buy lubricating oil at half the price you are paying—but while you are about it, why not use water? It costs less and the bearings will be destroyed just as quickly.

$$$

Rubber side curtains and tops can be folded into a small space—so can a derby hat—but it isn't always best.

$$$

A tire, a cut, three drops of oil, and a blow-out, are four acts in a farce that makes the accessory salesman smile and grow wealthy.

$$$

A proud motorist boasted that he never had to replace the oil in his engine base—he was right—he replaced the engine instead.

$$$

A witty reader writes: "We have a new Storage Battery **Charging** Station in this town—the sign is right, they charged me four dollars for my battery, now it won't work at all." You and your battery were both "over-charged," make them change the sign.

$$$

A "wobbly" front wheel is like a drunkard—it wastes the money.

$$$

Front wheels are usually bow-legged; but never should be cross-eyed.

$$$

If the bottom of a storage battery case interests you to the extent of five dollars, turn it over, otherwise keep it right side up. An inverted battery is as useful as a quart of steam, and just as lasting.

$$$

Of course you haven't thought of it before, but an electric cigar lighter would make a dandy Christmas present for the "Old Man;" and, wouldn't it look nice on his car?

$$$

Do you make a careful examination of the steering gear on your car every week or do you prefer to let the coroner investigate the trouble?

$$$

Dear Editor—A friend advised me to mix sawdust and heavy grease for my transmission to quiet it. Now I can't turn the gears over and the engine won't run; what is the cure?

You must be hard to satisfy; your transmission is quiet, isn't it? You can't cure the transmission but you might buy a new one.

$$$

A car on the road is worth two in the bush.

$$$

You never miss the chauffeur till the car runs wry.

$$$

You wouldn't think of using a ten pound sledge hammer to drive a tack; then why should you use an 18-inch wrench to tighten a timer bolt?

$$$

Carbon deposits in an engine are just like the kaiser; you must drive them out entirely or your engine will never run smoothly.

$$$

If your chauffeur races your engine you can assume that he has a friend in the repair business who is looking for an overhaul job.

$$$

Repairmen should always ask their customers if they read the Automobile Dealer and Repairer before they try to charge a day's time to adjusting a carburetor. We keep our readers informed.

$$$

Even a pulmotor and a gas mask won't save your life if you run your engine in a closed garage with no ventilation.

$$$

A punctured tire is an incident; a cracked windshield is an accident; and a broken steering gear is a funeral.

$$$

Don't sneer at your neighbor's car when you pass it on the good road—he may give you his dust on the next hill.

$$$

The man who is always knocking some one else's car is usually being knocked by his own and is looking for revenge.

$$$

Oh, you won't get home until morning—if you let your car run dry.

MISSING NUMBERS—Our readers are requested to remember that we are always pleased to re-send numbers which have gone astray in the mails.

MAY THE WORLD BE ILLUMINED BY THE LIGHT OF LIBERTY

There Is a Silver Lining to the Cloud of "No Automobile Shows"

THE National Automobile Chamber of Commerce has decided not to hold any of the usual large automobile shows this coming winter and spring.

The decision is wise and patriotic and right in line with the universal spirit of sacrifice and conservation, which is necessary for winning the Great War.

This magazine has always supported the large shows at New York, Chicago and Boston, not only by exhibiting and demonstrating in good space at the shows, but also by bringing out special show numbers and using our reading columns to give these shows suitable publicity. We have always believed in the "get-together" spirit, which has made the great national shows possible, and we regret the necessity of doing without them.

Nevertheless this cloud, like most others, has its silver lining. Show advertising has its merits, but the benefits obtained are largely of a general and indirect character

Nearly all good advertising experts will agree that trade journal advertising wisely placed is far superior to show advertising, when it comes to tangible returns in the shape of inquiries and orders.

Manufacturers of accessories will this year be saved a large expense, which is always involved in being properly represented at the big shows. The money usually expended by such manufacturers at the shows, may well be devoted this season to the purchase of good display advertising space in a carefully selected list of trade mediums.

For example, the expense of even a moderate sized booth in the New York and Chicago shows, including traveling expenses, salaries of attendants, freight and express shipments, etc., would be enough to purchase a whole page of advertising space in this magazine for one year.

With the great curtailment and possibly the entire cessation in the manufacture of new automobiles, it is more essential today, than ever before, to advertise auto accessories among dealers, repair men, public garage owners, and car owners. With over four million five hundred thousand cars in use, there is unquestionably an ample market for every accessory manufacturer, but advertising is absolutely necessary to reach this market.

With no show expenses necessary for the coming season, manufacturers will be able, without undue financial strain, to carry the greatly enlarged amount of trade journal advertising, which they actually need and must have to keep the wheels of business moving under war conditions during the coming season.

How Our Readers Can Show Their Appreciation of Our Magazine

THIS magazine is very fortunate in one respect. We have built up an amount of appreciation and even affection among our readers, which is very unusual for any trade publication.

There is seldom a day in this office that we do not receive letters from automobile dealers, repair men or car owners, in which it is stated that these subscribers are more than satisfied with the Automobile Dealer and Repairer on account of the useful information given of a practical nature. Sometimes a reader writes us that he has received information in a single article published in our magazine which has been worth to him ten times the subscription price, or even more than that.

Of course these tributes are extremely gratifying. They warm the "cockles" of the editorial heart and give us fresh courage to continue our present editorial policy and even encourage us to make additional improvements in the quality of our reading matter.

Nevertheless, we want to point out to our readers that they can show their appreciation in such a way that it will benefit us far more than they can possibly do by means of a complimentary letter.

There is an old proverb that "fine words butter no parsnips," and of course it is true that praise and encouragement will not directly contribute to the financial support of this or any other publishing enterprise.

If our readers really want to help us, they can do so in the best possible way, by taking special pains to answer the advertisements published in this magazine, but to make their help effective, they must do even more

Digitized by Google

than this; in writing to these advertisers they must mention the fact that they saw the announcement in the Automobile Dealer and Repairer.

The very life and bone and sinew of any magazine is in the advertising columns, and if we did not have this advertising support, it would be impossible for us to give our readers the information that we now furnish, except at a price of not less than $10.00 per year, and perhaps it could not be done even at this price.

Under war conditions, the automobile accessory manufacturers have been largely deprived of the patronage which they enjoyed before the war from large equipment orders received from manufacturers of accessories.

These accessory manufacturers must therefore look to the dealers, repair men and car owners for the marketing of their products and one object of publishing this magazine is to put these accessory manufacturers in touch with the classes named.

Every time you write a letter to any advertiser in our magazine requesting him to send you a catalogue or asking him to quote prices on his product, you are helping us more than you can in any other way, and of course if you can send actual orders to our advertisers, that is better still.

This editorial is intended as a strong plea to every reader to constantly bear this point in mind, by buying from our advertisers and writing them letters in response to their advertising.

If readers have time, we are glad to receive their complimentary letters and we appreciate them highly, but answering advertisements and mentioning our magazine will help us even more. Will you do it?

Strangling Business is a Serious Matter; We Must Increase Production to Win

IT is fortunate there is a prospect of the war being brought to a close next year. If we go on crippling or closing up industries by declaring them non-essential, in another two years our finances will be in a deplorable condition. There would be few outside of war material manufacturers to pay taxes or buy bonds. It is not conceivable that enough could be squeezed out of these industries to meet the needs of the Government or come anywhere near it. To pay taxes and at the same time to live, people must be permitted to make profits.

Instead of depriving manufacturers of raw material with which to do business, steps should be taken to increase the raw material and to increase the output of coal. To stop production of so-called non-essentials for any considerable period of time would come pretty close to being financial suicide.

Keep drawing from a barrel at the spigot and allow nothing to flow in at the bunghole and it is only a question of time when the barrel will be empty. It requires no profound financial knowledge to understand such a simple proposition as this. It is as plain as daylight, but some of our fantastic financiers in Congress do not seem to comprehend it. We are raising money by taxation by billions and spending it like water, and at the same time hampering the legitimate industries of the country.

To win the war requires money as well as men, and people must be permitted to make profits or they cannot pay taxes or buy bonds.

The House of Cards Will Tumble on Your Head if You Don't Advertise

THE general consensus of opinion among advertisers at present is that advertising is not as necessary as it was before the industries devoted their time to war work and for that reason the first department to suffer from the pruning knife of retrenchment is that of advertising.

A feeling of optimism pervades the manufacturers. Why should they plan for the future? Are not their factories filled with war orders? Are they not working overtime? Is not their production less than the demand?

Yes, it is now, and they are safe IF the war continues indefinitely.

But there is an IF which qualifies the fortune and those optimistic manufacturers may find the balloon of fortune punched full of holes if they don't watch out.

As soon as the war ceases, the stream of war orders will as immediately stop and the market will be flooded with the unused excess products. The dream-house of cards will tumble and the manufacturers whose products are not known to the automobilists will find themselves with expensive equipment and storehouses full of goods —but no market; truly a sad outlook.

From the smallest grocer to the largest automobile manufacturer, business depends directly upon good-will If the public know a product, and are sure of its value—they buy it. They patronize the grocer because they know he is honest—they know it by experience and because they know the man himself. They buy well-known products because they have seen them advertised.

The public is a fickle lover—"out of sight out of mind" —applies to their regard and the manufacturer who has allowed his product to be forgotten might just as well resign himself to the idea of spending millions of dollars in order to get his product before the public again, for he will be confronted by keen competition after the war.

The advertiser must not feel that the public will take his products just as eagerly as they did in the past when every magazine and paper carried their copy. His competitors are now the public's friends and he has been forgotten. The good public doesn't even know he is in business, they are fully satisfied with the other product and will continue to use it unless his advertisements are twice as large and convincing as the other fellow's.

If you, Mr. Advertiser, will only think this over, you will see the logic of it—so "get busy" and don't let yourself get "put on the shelf" of the public's opinion.

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.

The object is to encourage every operater of a motor vehicle to be careful and avoid accidents, especially the inexcusabe accident of a collision at a railway crossing.

BOY killed; skull fractured; arm broken; three people fatally injured as car"—etc., etc. We read these items in our daily papers without a shudder and we pass over them without giving them any more thought than the death of a couple in a distant country town; they don't concern us and anyway they are probably to blame. Who the "they" are, that are to blame, matters not.

But all at once you are involved in an accident which, of course, is terrible. Perhaps your arm is broken; perhaps it is your child that is killed; then you wring your hands and call upon the powers that be, for revenge and a quick punishment of the criminal.

You call upon all your friends and neighbors to protest with you for justice, to add their wails to yours. You, who have always coolly looked upon the griefs of others, feel that your troubles are public calamities, and call upon the world for sympathy.

Begin your sympathy campaign now, before the accident. Make yourself a committee of one and try to enlist others in a league for the Prevention of Useless Accidents. If your neighbor is a "speed bug," puncture his tire or steal his car—don't let him run over your son or wreck your car. Be your brother's keeper and do your part to prevent accidents. Join our "Life Saving Department."

Killed by Joy Rider: On the second of this month an old lady of New York was instantly killed by a joy rider who was operating his car at excessive speed. The driver of the car had taken it from the garage without permission of the owner and was operating it upon the left side of the street.

Ran Into a Curb: Two people were badly injured when an automobile in which they were riding crashed into the curb at Park Circle, Baltimore. The accident was evidently due entirely to carelessness. Investigation showed that the chauffeur evidently was not paying attention to his business.

Driving in Car Tracks: On the 6th of this month a woman in the back seat of a limousine was badly cut by broken glass when a trolley car crashed into the back of the automobile. The street at the point where the accident occurred was poorly lighted and the machine was not fitted with a tail light. The motorman claimed that he did not notice the machine in the tracks ahead.

Car Skids Through Bridge: In Cherokee, Iowa, recently, a boy was injured and died shortly after when an automobile in which he was driving crashed through the railing of a bridge. The accident was caused by skidding on the smooth planks of the bridge. The boy was pinned beneath the machine when it fell. A companion was but slightly injured and will recover. The car was being driven at a high rate of speed.

Victim of John Barleycorn: While driving a car at a normal rate of speed, a prominent business man of Atlantic City early this month killed a pedestrian who was staggering along the road. Witnesses said that the victim staggered directly into the path of the machine.

Hurled 40 feet Through Space: A reckless joy rider in New Rochelle recently killed an aged man and then ran away. The car was being driven at a high rate of speed and when hit, the 83-year-old victim was hurled 40 feet through the air, practically every bone in his body being broken. A witness said that two cars were racing, which accounted for the excessive speed.

Climbs on Sidewalk: An eight-year-old boy was crushed beneath the wheels of a motor truck last month when the machine, recklessly driven, climbed over the curbing on to the sidewalk. In addition to the victim, a number of other children and two women were badly injured. This accident occurred in New York City.

A Lenient Magistrate: The driver of a motor truck of Shreveport has cause for thankfulness in that the magistrate did not impose a fitting fine. The driver plead guilty to a charge of reckless driving and an accident in which he had run into a man as he was boarding a street car. He did not have a license and had just purchased the truck, yet he was fined only $50.

Woman Hit by a Machine: "I blew my horn and she wouldn't get out of the way so I ran into her," said a driver of a machine in New York, in defense of himself after having injured an aged woman in that city. Reports did not say whether or not the driver owned the whole town.

Killed at Crossing: An automobile truck loaded with wheat for a grist mill was driven directly in front of a steam locomotive at Washington, D. C. Although the engineer had given sufficient warning the operator of the truck seemed to think that he could get across the track before the engine arrived. Both the driver and one passenger were killed.

Passed Car on Wrong Side: An automobile driver of Buffalo recently knocked down and killed an aged woman who was crossing the street. Contrary to law, the driver passed a standing street car, which was discharging passengers, on the wrong side.

The Metal Turning Lathe

Part 3—Cross Tool Post Feeds, Screw Cutting, Lathe Tools and Various Types of Tail Stock Centers Used for General Work.

J. F. SPRINGER

WE have now had enough, perhaps, of the regulation of the speed of the lathe in order to meet the requirements of the metal in the work and the cutting tool, so let us give some attention to the management of the speed of the longitudinal feed.

When screw threads have to be cut, it is very necessary that, as the work turns, the tool be moved steadily lengthwise. For example, suppose we have to cut a screw thread having ten convolutions to the inch. This means that the tool that does the cutting shall be moved lengthwise of the work at such a rate that 1 inch will be covered for every ten turns of the work. There are perhaps a very few men who can make some kind of a screw thread by just depending on their nerve and steadiness and good judgment.

The way to cut a screw thread is, however, to put little or no dependence in these things for securing the proper regulation, but to make use of the lead screw of the lathe. This is a long screw arranged along the front of the lathe. The carriage which shifts along the lathe bed and which carries the tool post may be put in mesh with the lead screw. When this is done, one turn of the lead screw moves the carriage forward or backward one pitch of the lead screw.

Meaning of "Pitch."

The distance meant is the distance from the middle of one thread to the middle of the next thread, care being taken to measure parallel to the axis of the screw. A lead screw may have, say, six threads to the inch. The pitch is, in this case, exactly 1/6 inch. In order to cut a screw thread on the work, it is necessary to control the lead screw by the lathe spindle. That is, it is necessary to connect the two in such a way that when the spindle turns once the lead screw will advance the carriage precisely the right distance.

Take an easy example first. Suppose we want to cut 12 threads to the inch on the work. This means that the carriage must move forward exactly 1/12 inch every time the spindle turns round. If the lead screw has a pitch of 1/6 inch, then it will advance the carriage 1/12 inch in one-half of a turn. Consequently, what we have to do is to arrange matters so that one forward turn of the spindle will bring about one-half forward turn of the lead screw.

Now the spindle and the lead screw are parallel. In order merely to get the lead screw to rotate half as fast as the spindle, we have merely to put a spur gear on the spindle and arrange in mesh with it a second spur gear of double the size, this second gear being mounted on the lead screw. When this has been done, one turn of the spindle will bring one-half turn of the lead screw. This is at least part of what we want. We want in addition that the lead screw move the carriage in the proper direction, since we don't want to cut the thread backwards.

It is easy enough to reverse the direction of the rotation of the lead screw without changing its speed by putting an idle spur gear between the one on the spindle and the one on the lead screw. We don't even need to be careful as to the size of this intermediate gear. If the gear on the spindle is half the size of the gear on the lead screw then whatever the size of the intermediate gear the spindle and the lead screw will both rotate in the same direction and the latter will rotate at half the speed of the former. So much for this easy example. The matter is, however, of such considerable importance that it will be well to go somewhat further.

Suppose then that with the same lead screw it is proposed to cut a thread having 23 convolutions to the inch. What we have to do is to cause the lead screw to advance the carriage 1/23 inch during one turn of the spindle. The first thing we settle is this: How much of one turn of itself will the lead screw have to rotate to yield an advance of 1/23 inch? In one whole turn we get 1/6 inch. As many turns will be required as 1/6 is contained in 1/23. Dividing 1/23 by 1/6 we obtain 6/23 turn. We now have this result: For one turn of the spindle we must get 6/23 turn of the lead screw.

This is the same thing as saying that for 23 turns of the spindle we must have six turns of the lead screw. We can readily see that this is right. When the spindle has turned 23 times we should, for a thread having 23 convolutions per inch, have the carriage advance exactly one inch. This is just what it does in six of its rotations. So, then, we want a gear on the spindle and a gear on the lead screw such that 23 turns of the former will force six turns of the latter. If there are six cogs on the spindle gear and 23 cogs on the lead-screw gear, we shall get this result, for the reason that 23 turns of a six-cog gear will equal six turns of a 23-cog gear.*

From the foregoing, we get the following simple rule: Put on the spindle a gear having just as many cogs as the *lead screw* has convolutions to the inch, and on the

*A gear with only six cogs may seem objectionable. We can, however, double or treble the number, provided we double or treble the cogs on the lead screw gear. Thus, with an 18-cog gear on the spindle and a 69-cog gear on the lead screw, we will get the very same results.

Digitized by Google

lead screw a gear having as many cogs as the *proposed screw thread* has convolutions to the inch.

Learn This Important Rule.

This is a very important rule and should be thoroughly mastered. It will not be difficult to apply, after it is once comprehended. It is probably as simple a statement of what has to be done as it is possible to make. One or two points need attention. I can bring these out very well by means of examples.

Suppose the lead screw has eight convolutions to the inch and that you desire to cut a thread having 20 convolutions to the inch. According to our rule we put an eight-cog gear upon the spindle and a 20-cog gear on the lead screw. Let it be noted that both 8 and 20 are divisible by 4. Accordingly, we could use a two-cog gear on the spindle and a five-cog gear on the lead screw if we had such gears. A two-cog gear is, however, a ridiculous thing. So then we take some multiple of 2, as, for example, 16, 18, 20, 22, etc. The number of cogs for the lead-screw gear would be 40, 45, 50, 55, etc. In short, any numbers will do for the cogs of the two gears, provided only that they are in the ratio 2 to 5.

Take another example. Suppose we have a lead screw

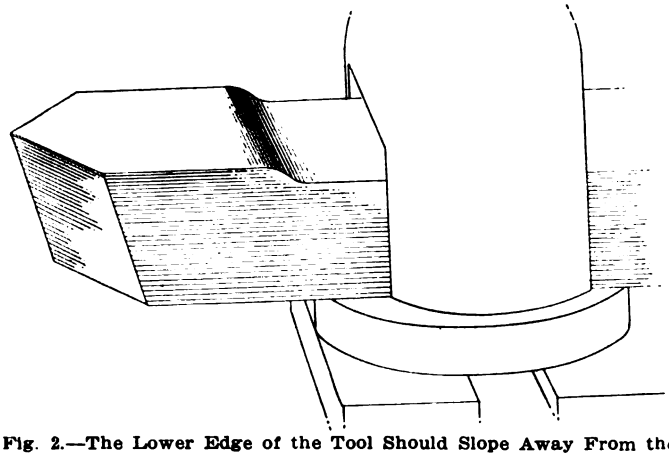

Fig. 2.—The Lower Edge of the Tool Should Slope Away From the Work. This Tool Shaped for 60° V. Thread.

with seven convolutions to the inch, and desire to produce a thread with 5½ convolutions to the inch. We may, in such a case, use 2 inches for the standard, when the problem will be 14 convolutions of the lead screw to a 2-inch length and 11 convolutions of the proposed thread to a 2-inch length.

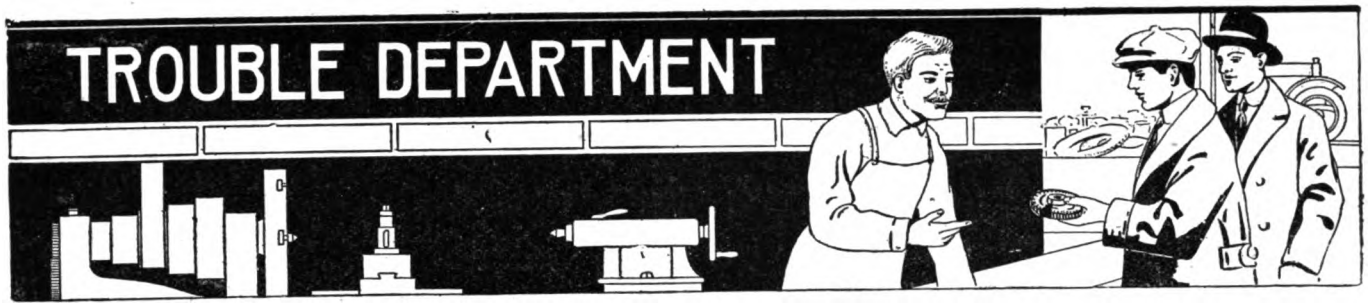
We follow our rule. On the spindle we put a gear having for its number of cogs, 14, 28, 42, etc., and on the lead screw a gear having for its number of cogs, 11, 22, 33, etc.

We could have gone ahead without bringing in the 2-inch standard length. That is, we could have applied our rule at once. In that case we should have required a seven-cog gear for the spindle and a 5½-cog gear for the lead screw. In order to get rid of fractions, we convert the numbers into 14 and 11, which is permissible since we have not altered the ratio.

In all this, we must not forget the intermediate gear, which is used to make spindle and lead screw rotate in the same direction. However, in changing gears to get the proper ratio for our screw-cutting, we may need to change the intermediate gear. The reason for changing it has nothing to do with the ratio. *The intermediate gear has no effect on the ratio.* A change may be needed, however, to put it in mesh with the gears on spindle and lead screw.

The thread-cutting too will naturally have its forward edges possess a small deviation from the vertical. Let them slope, then, slightly. in the general direction of the tool post as one looks down from the top face of the tool. This slope is needed for clearance. Aside from this provision for clearance, the tool front should have the same horizontal section all the way down. The front faces should be accurately shaped and ground to secure this. When this is done, the regrinding of the tool from time to time as it dulls will be simplified.

Cutting Tools.



In cutting screw threads, we use a tool whose nose is shaped on top to the exact size and form of the thread desired. This needs considerable explanation. The thread-cutting tool should be absolutely flat and horizontal on top, at least in the region of the nose. When this tool is adjusted in the tool post, it should be set so that the flat horizontal surface is really horizontal and at the exact level of the axis of the work. The top of the nose of the tool will then be in an axial plane of the screw that is to be. Its form and size should be exactly the form and size of an *axial section* of the desired screw when finished.

This tool will be moved forward lengthwise of the lathe by the lead screw. It will also be moved transversely to the lathe. This movement—the transverse feed—is ordinarily produced by turning the feed screw on the tool post. This is done by means of a hand wheel or a suitable crank.

We are now ready for an important point. There is only one feeding movement in cutting screw threads. The forward movement controlled by the lead screw has no effect on the cutting of the chip. This movement alone would result in no cutting. The chip is started and kept going by the feed through the tool post. The feeding then, in so far as the cutting of metal is concerned, is a hand-regulated operation. The responsibility rests entirely with the operator. All the cutting that is being done is being controlled by his right hand. A full understanding of this will surely make the operator pay rather more than ordinary attention to the transverse feed.

The thread, or perhaps I should say groove, is cut all over its surface at one time. The groove may be just begun and therefore shallow; or it may be deep and nearly to full depth. Either way, the tool cuts at both sides and in front simultaneously.

Differential Trouble.

2513

From J. J. Riess, Michigan.—I have a Buick Roadster, Model D-6-44, year 1918. Last week it started to grind when I shifted into high gear, but had never troubled me that way before.

When running at speeds between 15 and 35 miles per hour on high gear the grind is noticeable, but not on other gears or at lower speeds. I took the machine to a garage, and upon disassembling the rear axle the repair man found that the nut on the end of the driving shaft was badly damaged. I had him put in a new drive shaft and a nut, but the grind still remains, though the gears seem to be in good condition. Can you suggest the remedy?

Reply.—There are a number of possibilities for your trouble. In the first place we should advise you to clean the differential by removing all the grease and soaking the gears in kerosene oil. Then see that the small drive gear is not loose upon the shaft.

From what you say we would infer that the driving shaft has a certain amount of end play. That is, it slips downward far enough so that under certain conditions it will hit the differential housing. There should be no end play in this shaft. Next, be sure that there is no side play in the differential. Be sure that the differential is tight upon its bearings. Then examine the two gears and see if they are properly adjusted. The backs of the gear teeth should be together.

See if the nut on the end of the old drive shaft still hits the differential housing. Since the differential housing has been damaged by the old nut, it is very possible that it has been thrown out of line or that it has some projections that still interfere with the driving shaft. In any event, before you can make a proper examination, you will be obliged to remove all of the dirt and grease from the differential.

Fuel in Crank Case.

2514

From J. C. Bohl, Ohio.—I own an Overland car, 1916, which is giving satisfaction, except that during the cold weather there is trouble with the crank-case filling with something besides oil. As soon as the temperature drops I notice the oil gauge begins to creep up.

I have just had the carbon removed, the valves ground and the repair man says that the cylinders are in fine shape, the engine pulls well and starts easily, and I have cut the gasoline down as much as possible. Can you tell me the trouble and remedy?

Is it necessary to remove the head to replace push rod and valve guide bushings?

Reply.—Your trouble with the crank case filling that contains fuel is a common one. We published a number of articles dealing with this situation some few months ago. There is a strange inconsistency in gasoline engine action. In case of low compression the fuel will leak into the base. The same thing is true where the compression is excessive. The trouble is augmented by low temperature. There is but one remedy we know of to prevent this.

If your engine gives satisfaction in the warm months of the year, your trouble is undoubtedly due to poor vaporization. Install a larger hot-air stove or put in a new carburetor of the latest type. If it is possible for you to purchase a combination intake and exhaust manifold for this car, this will also help to solve your problem. The whole answer lies in increasing the heat along the manifold or carburetor line.

It will probably be necessary for you to remove the cylinder head in order to replace the valve stem and push rod guide bushings. At any rate, it will be the best plan because then there will be no danger of damaging the casting, and you can replace the bushing and ream it to fit the push rod much more conveniently than while it is on the machine.

Loud Hum in Transmission.

2515

From G. H. Pike, Massachusetts.—After having had my Ford car overhauled I have driven it over some very bad roads, often running for a mile or more in low gear. Apart from a few small troubles, the only thing I find that bothers me is a loud hum in the transmission, sometimes almost a roar. It seems to come from the rear axle at times, and is noticeable only in high speed. What is the trouble?

Reply.—We have never heard of a trouble such as you mention. Usually the hum, such as you speak of, is caused by improperly adjusted differential gears. We would advise you to make sure that this is not the trouble before you invest very much money in repairs. It is an easy matter for you to find out whether the trouble is in the gear-set or in the rear axle.

Digitized by Google

First, jack the car up and stand it firmly upon boxes or horses, then remove the rear axle from the car and start up the engine. Throw in the high speed clutch and see if the humming noise still proceeds. If so, it is in the gear-set. Otherwise it is in either the differential or in the driving shaft.

We cannot see how a humming noise could be caused in the transmission with the high speed clutch in, unless there is a loose member in the magneto. The only way to find the trouble would be to disassemble the unit in which the hum was located, and in case it is in the transmission, we should advise you to consult with a garage man. The only chance for anything of this kind is that something is dragging against the magneto or against the clutch cones in the transmission. You may be able to find this yourself by removing the covers of the gear set and inspecting it carefully.

We are very sorry that we cannot give you further assistance, but such a trouble is very difficult to diagnose unless one has seen the car.

Scored Rear Cylinder.

2516

From S. G. Miller, Nebraska.—I have a Hupmobile 32 that is giving me trouble. The spark plug in the rear cylinder soots very quickly, due to oil leakage. I have had new piston rings installed and the valves ground, but it did not make any difference.

What causes the engine to "jerk" when running on high speed at low car speed? How can I adjust the pinion driving gear? How can I put in a new disc clutch?

Reply.—It is very possible that the rear cylinder of your engine has been scored or badly scratched, and that the lubricating oil passes from the base into the explosion chamber.

Remove the piston and examine the walls and be sure that they are not damaged. Then make a series of careful measurements to determine whether or not the cylinder has been worn slightly egg-shaped. If you find that the walls are intact examine the piston rings and see that the clearance between the ends is not too great. Possibly when you fitted the rings you were not careful enough and they may not contact their whole circumference.

The only way that a piston ring should be fitted to get satisfaction is by the Prussian Blue and scraping method. Coat the inside walls of the cylinder with Prussian Blue and slip the piston ring mounted upon the wooden piston into place. Scrape off the high spots which are evidenced by deposits of the blue until the piston ring contacts with the cylinder all the way around.

See if you cannot cut down on the gasoline slightly. Perhaps you are using too much fuel. It is also possible that the same reason for jerky engine action can be traced to the source of trouble of carbonization. If the engine cannot be throttled down to a normal idling speed, there is evidently some leakage of air between the carburetor and the cylinders around the spark plugs or around the valve covers.

Make all joints tight with a mixture of graphite and lubricating oil, mixed to a thick paste. With the engine running at the lowest speed possible, squirt some gasoline around each of the valve stems in turn and note the effect upon the engine. If the engine speeds up or slows down, it is evident that there is a leak or there are leaks around the valve stems. In this case you will be obliged to replace the valve guides.

The replacing of the disc clutch is too large a job for you to undertake yourself. You will be obliged to disconnect the propeller shaft at the universal joint in back of the transmission gear-set, remove all of the control rods, wiring, etc., and lift the engine together with the gear-set out of the frame. Then disconnect the gear-set housing from the engine at the flywheel housing. You can then remove the gear-set and expose the driven clutch member together with the small clutch springs mounted upon the outside of the driven clutch member.

As soon as the spring retaining nuts have been taken off and the springs removed, the clutch may be pulled from the flywheel and the discs taken out and replaced. Should you attempt this job yourself you would be very apt to damage some of the engine parts. Only a shop that is equipped to lift the heavy units from a frame should attempt such an extensive repair.

Peculiar Grinding Noise.

2517

From C. D. Schwine, Alabama.—I have a Studebaker 6—1918 model. It runs well and has plenty of power but there is a loud sing or hum when the car is running faster than five miles per hour. The noise seems to come from the timing gears, just to the right of the engine. Repair man cannot seem to locate it, can you help?

Reply: As you describe the noise in your Studebaker car, we are inclined to think that it arises from the starting motor clutch or ratchet in the timing gear case, or from the generator. Very frequently, a hum such as you mention can be traced to brush trouble or the commutator in the generator.

Examine this unit and see that the brushes fit the commutator and be sure that the mica segments on the commutator do not extend above the copper segments. We would advise you to remove the front of the timing gear case and inspect the starting motor ratchet. This ratchet is fastened to the crank shaft with a left hand thread and may be removed with a large wrench by turning it towards the left while the flywheel is being held by an assistant. When the ratchet is removed the starting clutch is exposed for examination.

It is very possible that the clutch is not receiving sufficient lubricant or is badly worn. Notice whether or not the starting motor is operated while the engine is running. The starting motor chain should remain still ex-

Digitized by Google

cept when the unit is being used for starting. If the unit runs with the engine the humming noise is due to the chain and to prevent it from running, the starting clutch should be repaired.

If you are still unable to find your trouble after following the above directions let us hear from you again. Be sure to give all details.

2518 **Oakland Model 42 Wiring.**

From L. E. Harris, New Hampshire.—Your journal has given me much useful information and now I am looking for more.

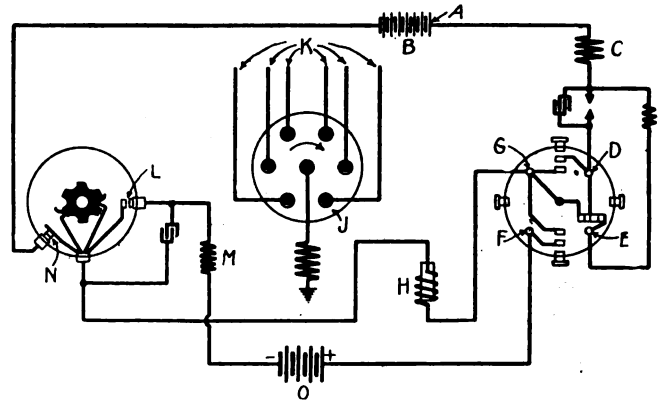
I am driving a Model 42 Oakland touring car, year of 1913, which is equipped with a dual ignition system consisting of dry cells and a Delco system. I have never had a particle of trouble with the ignition until recently when coming home one evening, in coming up a hill the car suddenly began to jerk and jump and lost its power entirely. I managed to get up the hill in second speed and got home but the engine worked very poorly.

I found that it works all right on the cells, which shows that the trouble is in the system, which gets current from the storage battery. The battery is in good condition and fully charged and the breaker points seem to be all right and the gap the right distance. There are two sets of breaker points, one for the storage battery current and one for the cells; a primary wire from a common post on the coil to a common post on the breaker box, a return wire on the coil to a common post on the breaker box, a return wire to the storage battery and one to the cells leading from the other two posts on the breaker box.

I find that with the switch on the cells circuit and the engine turned until the cam closes the breaker points, if I disconnect the return wire of the storage battery system from the post on the breaker box, a heavy spark jumps from the wire to the post or to any metal part of the breaker box housing if I touch it with the wire.

I do not understand why there should be any current on this wire when I am using the cells.

I have traced all the wires, cleaned all connections and put in new ones where they were poor, and although it runs much better it is not right yet and I still get the spark at the storage battery connection post on the breaker box. When it was at its worst I got a heavy shock when I pressed the horn button. There is a condenser for the storage battery current on the breaker box.



I am not much of an electrician but have covered the main points as I understand them. Although there is a heavy spark when I disconnect the wire at the breaker box it does not affect the running of the engine on the cells in the least. What do you think is the trouble?

Reply:—On your model 42 Oakland touring car, year 1913, there are two separate ignition systems and two sets of breaker points. If you will follow the wires through from the set of dry cells you will find that the current passes from the carbon terminal of the dry cells to the ignition relay, through this unit to the ignition switch and when the ignition switch is put upon the cell side, through this unit to the ignition coil, through the ignition coil to the common terminal on the breaker box, and when they touch each other, across them to the terminal, and thence back to the zinc pole of the dry cells. When the switch is thrown from the cell side to the battery side, the storage battery is used and the circuit is as follows:

From the positive terminal of the storage battery to the terminal on the ignition switch, thence to the ignition coil, through the coil to the common terminal on the breaker box, then to the storage battery contact and then through a resistance unit back to the storage battery.

This system is termed a two wire single coil system. One end of the secondary coil is grounded and the other end is connected to the center of the distributor box.

To test out this system proceed as follows: Throw the ignition switch to the off position, turn the engine over until both sets of contacts are together. Then remove in succession each of the wires from the breaker box and touch it to its respective contact point. There

Wiring of Ignition System on Oakland Car.

should be no spark in the system, if there is it is evidence of a grounded or short circuited wire.

Replace the wires with the exception of the wire leading from the zinc of the cells to the breaker box. Throw the switch to the cell position and you should obtain a spark at the cell contact on the breaker box. With your fingers hold the cell contacts apart and connect the wire to the cell contact point. Remove the wire leading from the coil to the center of the distributor and hold it about ⅛ of an inch away from the engine or the frame. Allow the contact to come together in the breaker box and snap them apart quickly. You should obtain a spark at the secondary wire. If not, there is some fault in the wiring. Trace it out. Replace the wire and remove the storage battery wire, that is, the one that leads from the breaker box to the resistance unit, thence to the negative side of the storage battery. Throw the switch to the off position and you should not get any spark at the breaker box. If you do there is evidence of a grounded wire or short circuit. Connect the wire to its proper terminal, hold the points apart with your finger, throw the switch to the battery position and try the same experiment of

Digitized by Google

snapping the points together and apart rapidly to see if you get a spark at the secondary wire.

You will probably find that your trouble is due either to a wire broken inside the insulation, a poor connection, or a short circuited wire.

We produce herewith a diagram of the ignition wiring on this machine and trust that you will be able to locate the difficulty. If not, write us again, telling what you have done and we will try to help you further.

Ford Main Bearings.

2519

From James Quinn, Rhode Island—I have gained many useful hints from your magazine and now need a little help. I have a Ford car, 1917 model, which ran all right until the crank shaft broke. I replaced this shaft myself and in the course of the work, I discovered the cylinder block to be cracked. I had the block welded and the heat burned out the main bearings.

I tried to replace these bearings myself, but the babbitt I used was not as good as that in the engine at first. Would that make any difference? I scraped the bearings carefully and tightened them up until I could hardly turn over the engine. In addition to this work, I put in two new connecting rod bearings.

After the engine had been run about 50 miles it started to knock so I tightened the main bearings. It then ran finely for about 50 miles more when it began to knock again. I have talked with a garage man, who says that I would always hear that knock. Have you ever heard of a knock that couldn't be located and stopped? What is the trouble in your estimation?

Reply: We doubt very much if your trouble is caused by poor babbitt, although there is a possibility that you secured a soft grade of metal. You should be able to obtain the best grade of babbitt from Belcher & Loomis of Providence. The writer has used the babbitt used by this concern and found it to be excellent material.

Your trouble is probably due to the fact that you did not secure proper crank shaft alignment and as the bearings are at the present time out of line with the crank shaft, the crank shaft is probably sprung. You will be obliged to pull the whole engine out again and replace the babbitt bearings with new. Such a repair should not be attempted by anyone who is not accustomed to the work. The replacing of a main bearing is the biggest job upon the whole machine and we should advise you to forward the block together with the crank shaft to the Ford agency in Providence.

There is no company which manufactures bearings for a Ford car which can be applied in the way you mention. If in boring the babbitt bearings the shaft was not lined up within .003 of an inch, all of the connecting rods would be thrown off line and the engine would knock excessively. Proper main bearing repair is the only remedy. We have never heard of a knock in a Ford car that did not have a reason for it. We are very sorry that we cannot help you any further, but we are giving you the best advice in our power, knowing as we do the extreme difficulty of replacing main bearings.

No Spark From Magneto.

2520

From Benton Bragg, Alabama—I have a Flanders 20 car fitted with a Simms high tension magneto. After the car has stood idle for a few days, I cannot seem to get a spark until it has been towed very fast for a few hundred yards. After this is done, it runs all right and can be started easily until it has remained idle for a while.

Can you tell me the possible trouble and how to remedy it?

Reply:—In the first place you might examine the breaker points to see that they are smooth and flat and contact across their full face. If they are worn or pitted they should be replaced with new ones.

After they have been fixed so that they contact across their full surface, turn the engine over until the roller rides upon the top of the cam and the breaker points are fully separated. Then adjust this clearance or separation so that is is about .025 of an inch and not more than 1/64 of an inch. In all probability your trouble is due to the fact that the breaker points have worn badly and do not contact properly.

Charging Storage Battery.

2521

From C. D. Blalock, Oklahoma.—I would like to know if there is any way I can use a current reducer like that used for bell ringing and small electrical toys upon a house current line, for charging storage batteries? The current supply is alternating.

Reply:—You cannot use this device in combination with alternating current for charging a storage battery for the very reason that the current at the delivery end is alternating rather than direct. Such alternating curent can be used for running small toys and electric bells but is not suitable for charging storage batteries. The result would be a damaged battery and a burned-out current reducer.

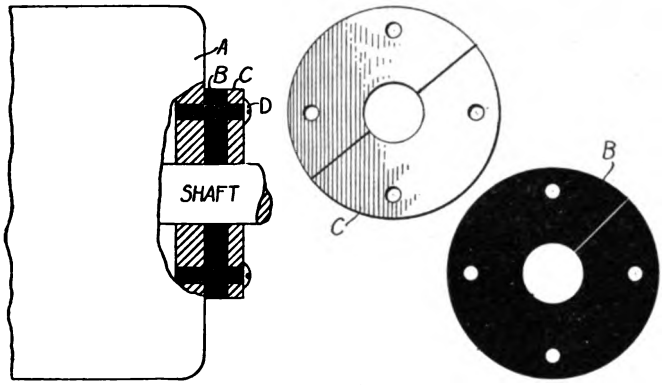
Upset Storage Battery.

2522

From Max Jessup, Michigan.—I purchased a new storage battery recently and in some way all of the solution from the middle cell was spilled. Kindly let me know how to refill it?

Reply:—Immediately upon receipt of this letter we would advise you to take your storage battery to the nearest battery repair station, and have the faulty cell taken apart, cleaned and the electrolyte replaced. If you were to fill it yourself you would undoubtedly destroy it and ruin the battery completely.

This work can only be done at a service station by an experienced battery man. Electrolyte consists of a solution of pure sulphuric acid and distilled water. If either



Digitized by Google

of these fluids are not absolutely chemically pure, the battery will be destroyed within a very short time.

When the battery was tipped over, undoubtedly the rest of the cells were somewhat damaged. The sediment or mud at the bottom of the battery has probably worked up through the plates and will destroy them unless each plate is carefully cleaned. We are sorry that we cannot help you further, but this is one of the times when an expert's assistance is necessary.

2523 Oil Leakage in Generator Shaft.

From G. B. Gerhardt Bentson, Montana.—Can you tell me how to stop the leakage of oil between the fan belt

Showing How to Apply Felt Washer to Housing to Prevent Oil Leakage.

hole on the generator shaft and the generator housing on an Elgin car?

Reply: In practically any machine where there is a rotating shaft and sufficient room it is a very easy matter to apply a felt washer. The felt washer should be made as shown in the accompanying illustration at B and in order to slip it over the shaft it may be cut from the hole to the outside.

The hole should be made slightly smaller than the shaft. To hold this washer in place a second washer of brass or iron about ⅛ of an inch thick should be made. This washer should be cut into two pieces as shown at C and each piece bored for two retaining screws. Then the whole device applied to the generator or the housing either inside or out, as room permits, as shown in the same figure. A illustrates the housing, B the felt washer and C the iron washer which holds the felt in place.

2524 Muffler Explosions.

From H. H. Hiett, West Virginia—I have a new Ford car which frequently gives a report from the muffler like that of a shot gun. Recently the explosion burst the muffler open. Please tell me the cause of this and what will remedy the trouble?

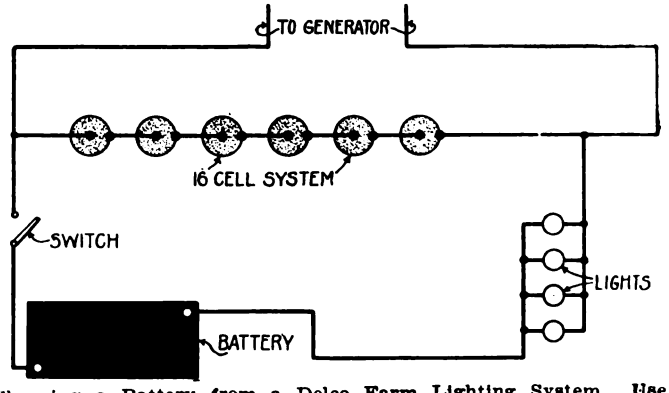
Reply:—The explosion was probably caused by a short circuit in the timer or in the ignition system. Very occasionally one of the timer wires gets connected with the body of the timer and causes a back fire.

This is one possibility and if you are in doubt, we should advise you to carefully insulate all of the timer connections with tape.

The next possibility is that the exhaust valves in one of the cylinders became held open for a very short period of time, pumping the exhaust line full of unburnt gas and exploding it from one of the other active cylinders. We should advise you to clean out the exhaust line, remove the carbon from the cylinders, adjust the valve clearance in all of the valves to between 1/16 and 1/32 of an inch. Be sure that all the valves seat. Retard the spark and see that it occurs in the proper cylinder just after the piston has passed the top of its firing stroke.

See that the wires are connected so that the engine will fire in the order 1-2-4-3.

2525 Undercutting Mica.



From F. P. Holtzman, Ohio.—My repairman, who is a good, conscientious mechanic, after turning off the commutators on the generator and starting motor of my car, wanted to dig out the mica from beneath the copper segments to a depth of about the width of the mica. I objected to this because I thought the particles of copper and carbon from the brushes would settle in these cracks and short circuit the unit. Should this undercutting be done or not?

Reply:—Your automobile mechanic was perfectly right in desiring to pick out the mica between the copper segments on the commutator, for by leaving this mica in position you are defeating your own argument. At present there is danger that the little particles of copper and carbon from the brushes will stay or become imbedded in the mica. If the mica is cut below the surface about the width of the segment, the little carbon particles will not be forced into its surface.

Then again, the copper segments will be worn much more smoothly if the mica surface is below them. There is also a tendency to arc when the mica is left flush with the surface.

2526 Charging Batteries From System.

From W. Siddon, Mississippi.—I have a 32 volt lighting plant (Delco System) and would like to charge a six volt storage battery from it. Will you kindly give me a

Charging a Battery from a Delco Farm Lighting System. Use Four 30 Watt Lights; or Three 40 Watt Lights; or Two 50 Watt Lights.

sketch as to how the wiring connections should be made?

Reply:—A wiring diagram is given herewith. For resistance you should use lights as shown; the number depends upon the charging rate.

Digitized by Google

Dodge Car Clutch.

2527

From H. C. Gray, Maine.—Will you tell me what can be done with a Dodge Bros. car clutch which engages too quickly, or "grabs"?

Reply.—We are sorry that you did not tell us the year or model of your car, because there have been three different styles of clutches used on this machine. If the clutch is a cone arrangement, wash it thoroughly with kerosene oil and scrub it with a stiff scrubbing brush, then soak it well with Neatsfoot oil.

If your model is fitted with compensating plungers and springs around the edge of the clutch, tighten these springs slightly. Be sure to tighten them all about the same amount. If the clutch is not fitted with compensating plungers, get a number of small pieces of leather about an inch in width and ⅛ inch thickness and place them between the leather facing and the clutch cone. Space them about eight inches apart around the rim. If the clutch is of the multiple disc type, you will be obliged to replace the fabric facing on the clutch discs with new.

Finding Firing Order.

2528

From G. W. Lutz, Pennsylvania—I have a Saxon 1914 car and have just put in a new cylinder block. I have removed all of the gears and in replacing them I doubt if I did the work right as I cannot start it.

Will you give me the firing order of this machine? How can I time the magneto?

Reply:—We cannot tell you the firing order of such an old model, but we can tell you how you can find the firing order very easily for yourself. Open the petcocks or remove the plugs from the cylinders and press your hand down over the petcock or the spark plug hole. Then turn the engine over until you feel compression in cylinder number one. Remove your hand and turn the engine until that piston is at the top of its stroke. You will know now that this first cylinder is ready to fire because it has reached the top of its compression stroke.

Next put your hands over the petcock openings or spark plug openings in cylinders 2 and 3, and have someone turn the engine another half revolution. Compression will occur in either of these cylinders. If it is No. 2, the firing order of your engine is 1-2-4-3. If you find the compression is in No. 3 cylinder, then the firing order is 1-3-4-2.

You can verify this firing order by turning the engine over until the exhaust valve in No. 1 cylinder has started to open. Then watch the exhaust valves in Nos. 2 and 3 cylinders. If the exhaust valve in No. 2 cylinder opens next, you will note that this cylinder fires second in order and so the firing order is 1-2-4-3. If the exhaust valve in No. 3 cylinder opens second, you know that your firing order is 1-3-4-2.

After you have found the firing order, turn the engine again until the piston in No. 1 cylinder is at the top of its compression stroke. Turn it still further until the piston has just started to go down. Probably you will find the flywheel marked DC 1 and 4, and if so, turn the flywheel until the DC 1 and 4 is about ¼ of an inch past the indicator or the center of the cylinder block.

Retard the spark and set the breaker points so that they are just beginning to separate, or if this car was fitted with a vibrator system, set the timer so that the roller is just starting to make contact. Verify this setting by advancing the spark two or three notches. The breaker points should open or the vibrator should vibrate if it is a vibrating coil. Replace the spark plugs or close the priming cocks. Prime the engine with gasoline after being sure that all the plugs are absolutely clean. Crank the engine and it should start.

If after these directions you cannot start the engine let us know at what point the intake valve starts to open and the exhaust valve starts closing, and we will try to give you still further directions. The exhaust valve as a general rule starts to open 45 degrees before the piston gets to the bottom of its stroke and closes at top or slightly after top center. The intake valve should open about 5 degrees after the exhaust valve is closed.

One of the articles in our September number gives you a number of suggestions as to engine trouble and we should advise you to read it carefully.

Rattle at Back of Car.

2529

From W. Wightman, Maine.—I have a —— runabout and am having a peculiar trouble. On rough roads or over cobblestones there is a peculiar rattling noise in the rear. If the speed is even normal, one would think that the whole rear of the car was coming to pieces. Recently I put five bags of sand in the rear compartment and this seemed to quiet it. I need the room, however, and would like to take the sand out and stop the rattle.

When I try to go up a hill there is a bad knock in the engine and I have to pull the spark way down to stop it.

There is also a grind in the rear axle. Will you tell me how to repair the various parts of the machine?

Reply:—Very evidently your trouble of rattling at the back of the car is due to loose bolts or loose spring perches. The only thing we can advise you to do is to examine the springs very carefully. Be sure that they are tight upon the axles and firmly fastened to the frame. Be sure that the radius rods are tight and above all be sure that the body is firmly bolted to the frame. This last is a very common trouble, since body bolts work out of place very easily. The knock in your engine is due either to carbon deposits in the cylinders or a loose connecting rod, or a loose valve sleeve eccentric rod. This is a serious matter and you should take the car to an experienced garage man immediately. The grinding in the rear axle is probably due to wrongly adjusted gears. A garage man should be able to adjust these gears in a few minutes.

If you have very many troubles with your car our best advice is that you consult a repair man.

The Chicago Permanent Exposition

The Community Garage Principle Enlarged and Carried Out In a Large Centralized Show Room

EVER since the Government issued the curtailment edict to the automobile manufacturers and other kindred interests, there has been a concerted drawing of deep breaths and a general feeling of "what can be done about it"; everyone has been looking for a solution or depending upon some one of the "larger lights" to furnish a solution to the problem.

At last, a body of far-sighted business men have produced a solution which upon the face of it is so simple that it seems almost ridiculous—a permanent exposition. Think this over, however, and you will admit that it is one of the most brilliant ideas of the century. An all-year-automobile-and-accessory-show.

In the beginning, automobile salesmen established their showrooms in different parts of cities. When the Speedbuilt agency opened a salesroom on a certain avenue, it was a signal that the next agency was to be established in the other side of the city. As time went on however, and agencies increased in number, they found it necessary to open salesrooms at times within a few miles of each other. Analysis showed that where three or more agencies were near together—more business was done, contrary to all ideas as to competition, and so salesrooms were shortly moved to a certain locality.

In every city throughout the country there is an "automobile row." The prospective buyer does not have to "walk his feet off" in order to see a certain line of cars. Within a few minutes he can visit many salesrooms and take his choice. This is the present situation, now let us take another step forward and look into the future.

You have in mind purchasing a machine, but don't know what it will be. You have received three or four pounds of automobile literature and have tired your eyes looking over advertisements in the papers, which say much about crank-shafts; multiple friction discs; demountable rims, and ventilated windshields. You finally decide that the question must be settled in your mind and that you will order your car today.

So, you step into a trolley and journey down-town to a large ten-story building, well lighted and attractive. You enter the door and are given a directory of the exhibits, prices, etc., and within five minutes you have looked over the five or six cars you are willing to consider. Then back you go to the first car and listen to the salesman and his arguments; two or three steps takes you to your second choice and you compare the two, and so on until you have obtained a full knowledge of all the cars.

How easy it is to make comparisons, you can almost put the cars side by side. The Speedbuilt has a patented no-man top; after a second's comparison, you find that the salesman for the Simplus neglected to mention that feature on his car. Point by point you compare the two until finally you can make your decision. You didn't have to walk two miles and you are absolutely sure that you own the car you really want, because you have chosen it by comparison.

"An ideal plan, but not possible," you say. Ah, that's just where you are wrong; it is possible and the Chicago Permanent Exposition is proof of its practicability, or will be within a few months. It is to be at once the biggest and most patriotic plan that the automobile world has seen, just as we have outlined the idea.

This Exposition is to occupy the immense Siegel-Cooper building at the corner of Van Buren and Congress streets, Chicago, Illinois. A nine story edifice, 400 feet long, 146 feet wide, with no partitions on any floor and containing 593,712 square feet, or nearly fourteen acres. It is accessible on all sides by elevated and surface lines and from this corner cars diverge to every part of the city. It is within two blocks of the postoffice, three blocks of the Board of Trade and only a short distance from all of the railways stations and principal hotels.

According to the latest plans the various floors are reserved for the following purposes:

First—Accommodations for a new car show.
Second—Accommodations for a used car show.
Third—Accommodations for a truck show.
Fourth—Accommodations for a tractor show.
Fifth—Automobile and Tractor Accessories show.
Sixth—Permanent display of Trucks and Tractors.
Seventh—Permanent display of Automobiles and equipments, etc.
Eighth—Permanent display of Used Cars.
Ninth—Four quarterly used car and truck sales.
Tenth—National exhibits of machinery, food, agricultural implements, public health exhibits, and anything of general interest to the public.

In other words, this great building is to be the center of interest for all matters pertaining to the public good. It will attract the attention of every visitor to Chicago and will be an ideal show room for the manufacturer.

For the year 1919 many features are planned, events which will attract men from all walks of life to the building where they will be able to see the cars upon exhibition.

As a practical proposition it would seem that nothing could be better. The cost of rental for a whole year of space is said to be little more than for the one week show at the Coliseum. The various show rooms throughout the city can easily be dispensed with and the machines exhibited in the one building, where the cost will be considerably lower.

Chicago's Big Show Was a Success

The Various Exhibitors Were More Than Pleased At the Showing Made On the Municipal Pier At Chicago

AFTER the second annual National Exposition of trucks, tractors and accessories which was held upon the Municipal Pier at Chicago had drawn to a close and all things were taken into consideration, the unanimous opinion was expressed that the show had proved a great success.

War time economy and economy equipment are words that have been upon everyone's lips for the past year. We have conserved gasoline and repaired our old cars, and we have always been on the lookout for equipment and accessories which would enable us to conserve even more than formerly.

Our business has been to fight the hun both at home and abroad and like every other task we have undertaken, we have tried our utmost to accomplish what we started to do.

It was exactly this sentiment that permeated the annual exposition and throughout the spirit of patriotism predominated. The show proved conclusively that the Municipal Pier is the logical place in the future for holding exhibitions. It is 1,000 feet in length and presents many thousands of feet of clear floor space with no additions or second floors to tire the visitor.

The exhibit for trucks attracted considerable attention as did that for the tractor. Many farmers and small business men went away from the show with the fixed idea of purchasing one or both of these machines and many left their orders with the exhibitors. We feel that it is safe to say the visitors were 100 per cent. interested. It is true that there was not a great crowd of curiosity seekers, but the exhibitors all knew that the persons who did show interest enough to attend were prospective customers and such being the case they were able to devote their full attention to those showing an interest in trade products. Despite the latter conditions and other circumstances the attendance was far beyond that anticipated by the management, who did everything in their power to make the show a success.

As an added inducement and attraction, a portion of the pier was devoted to dancing each evening, and the music was exceptionally fine. The decorations were attractive and consisted mostly of flags and bunting. Since the pier seems to be an ideal place for such an exhibition, doubtless the management will endeavor to hold the show upon it next year.

Interesting Fuel Economy Tests

The Tests of Auxiliary Fuels, Carburetors and Attachments Made Under the Direction of the New York Herald Were Satisfactory

THE question of fuel economy, carburetor equipment, auxiliary fuels and special devices for winter equipment, is one which is puzzling every automobile owner at the present time, and we doubt if ever there has been a more laudable effort made than that of the New York Herald in planning the motor fuel economy test which was run on Thursday and Friday, October 3d and 4th, and to Washington the week of September 7th.

This fuel economy test, as the title indicates, was primarily to find to what extent certain advertised products would fulfill that which was claimed for them, and in every case the device entered showed a great efficiency and proved that no autoist can afford to run his car without investigating them.

Every means was taken to prevent criticism. There are at present on the market many hundreds of devices and the autoist has little chance of trying fuel devices unless he cares to invest his money. It is claimed that every manufacturer of such devices was given the opportunity to enter his product in the test. Many manufacturers did not take advantage of this offer and others were unable to enter their cars in time.

Only 29 entries were made, all by well advertised concerns whose products are well known to our readers. These appliances will be considered in their order and the complete results shown, discussed. It is not the intention of this article to boom or criticize any of them, simply to keep our readers informed as to the showing made.

There were three series of tests made, each upon one gallon of Socony gasoline in an auxiliary tank. The cars were operated at the speeds of 10, 20 and 30 miles per hour; the first day upon standard equipment, the second day upon the special equipment which they manufactured, or used the auxiliary fuel which they produced. The second series of tests were also made at corresponding speeds of 10, 20 and 30 miles per hour.

The Reed Appliance of Detroit, Michigan, demonstrated a kerosene dry gas carburetor together with a water attachment. At a speed of 10 miles per hour, the device showed considerably over 26 miles per gallon:

Digitized by Google

at 20 miles per hour, 29 miles per gallon; and at 30 miles, 25 miles per gallon. With regular equipment the same machine, which was a Ford, developed 14, 16 and 13 miles per gallon, respectively.

The Hot Pin Manifold, manufactured by the Kerosene Burning Carburetor Co. of Detroit, showed 38, 35 and 29 miles per gallon at 10, 20 and 30 miles per hour respectively; while without this equipment the Ford car made 32, 23 and 17 miles at the same corresponding speeds. This same type of manifold was entered upon a second Ford and the results were practically the same.

The gasoline carburetor manufactured by the E. & E. Carburetor Company gave a mileage of 28, 31 and 27, as compared with 19, 18 and 16 miles at speeds of 10, 20 and 30 miles per hour with regular equipment.

The Toquet Manufacturing Company applied their carburetor and showed a mileage of 21, 24 and 17 at the three speeds mentioned, as against 16, 16 and 14 miles per gallon without the equipment.

The Miller Chemical Company, in using their product of Oxigene, showed a 50 per cent. saving in mileage as compared with the stock gasoline. The Crow-Elkhart car which was used gave mileages of 10, 12 and 10 as compared with 15, 18 and 15 after the gasoline had been treated with Oxigene.

The Duntley Company equipped their Ford car with their special gasoline generator with satisfactory results, showing mileages of 31, 20 and 23, as against 20, 24 and 27 without their equipment.

Butler Mfg. Co. made tests with a Ford and an Overland car. With the standard equipment the Ford car gave mileages of 24, 22 and 17 and with the special equipment 33, 28 and 22. When the Overland car was used the saving was extremely large. Without the equipment 12, 16 and 13 miles per gallon only were obtained, whereas with the equipment 24, 20 and 14 miles per gallon were obtainable.

The Sunderman Gasoline Carburetor upon a Ford car showed more than 100 per cent. saving in gasoline. At the three speeds without the Sunderman carburetor the Ford car gave only 15, 12 and 12 miles on a gallon, whereas with the carburetor the mileage obtained was 30, 35 and 27. Although the results did not show such a tremendous increase in efficiency when used on the Oakland car, the tests proved that the carburetor would pay for itself in a very short time. In this case, with stock equipment, the Oakland car made 15, 26 and 23 miles per gallon, whereas with the Sunderman carburetor 26 miles per gallon were obtainable at all three trial speeds.

The J. E. S. Gasifier entered by the Kerosene Motor Appliance also showed remarkable results. The first day's test with standard equipment showed 15, 21 and 15 miles per gallon as a good average. At the second day's test with the gasifier at the speeds of 10 and 20 miles per hour 31 miles per gallon were obtained, and at the speed of 30 miles per hour 27 miles per gallon. This test was made on a Buick car. The same device when used on a Ford car gave 27, 30 and 25 miles per gallon as against 22, 17 and 15 without it.

The Dippe Super Heater Co. demonstrated upon a Packard 1912 car, which with stock equipment gave 10, 12 and 10 miles per gallon. With the Super Heater the mileage was increased to 14, 15 and 14.

The E. A. Cassidy Company demonstrated Eccolene in a Franklin and Hudson car. In the first case the Franklin car with standard equipment ran 23, 24 and 20 miles on a gallon. After Eccolene had been put in the gasoline, 29, 27 and 20 miles per gallon were obtained. The mileages shown by the Hudson car with stock equipment were 16, 17 and 15 miles per gallon; however, with Eccolene in the gasoline, at the first two speeds 19 miles per gallon were obtainable, and at 30 miles per hour 16 miles per gallon were obtained.

The Remington Mfg. Co. used a Ford car which averaged 26, 18 and 14 miles without their equipment and showed 29, 34 and 22 miles per gallon with their auxiliary air carburetor.

The Rite-O-Way Mfg. Company's Maxwell car in the first test consumed a gallon of gasoline in 24, 26 and 24 miles at the three speeds, while with the auxiliary fuel attachment the same car gave 29, 27 and 26 miles per gallon. The Derf Mfg. Co. demonstrated two products, their Derf Spark Plug and a Kerosene Carburetor designed for 50 per cent. kerosene and 50 per cent. gasoline. With standard equipment the Mercer car ran 12, 13 and 11 miles on a gallon. After applying their spark plug and carburetor the car showed 15, 19 and 10 miles per gallon.

The Henner Automatic Oil Carburetor Company demonstrated their kerosene carburetor and water attachment on both a Ford and an Oldsmobile car. The former with the standard equipment gave 19, 26 and 22 miles per gallon, whereas with the attachment the mileage showed 18, 37 and 28 miles per gallon, a slight drop at the lower speed but a gain at the 20-mile rate. The results from the Oldsmobile were considerably more satisfactory. This car gave mileages of 11, 11 and 13 without the equipment and showed 16, 18 and 15 with the carburetor.

The carburetor used by A. H. Gussman showed a saving of nearly 50 per cent. on the Buick car, the mileages obtained with this carburetor were 20, 17 and 19, whereas without it the Buick developed 11, 12 and 9 miles per gallon.

E. G. Hodges in the twenty-sixth entry used a Kissel car, which developed 10, 11 and 13 miles on a gallon. With this equipment the same machine showed 14, 17 and 16 miles on a gallon.

A special attachment for feeding air at higher speeds was demonstrated by the National Mfg. Corp. and showed 14, 13 and 10 miles per gallon. Without this attachment the Winton car developed 11, 7 and 8 miles.

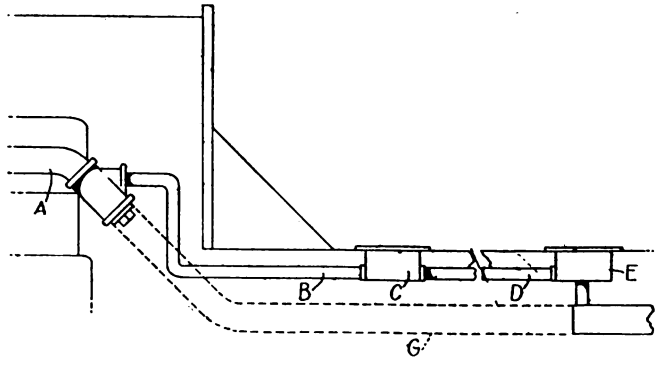
Why Freeze to Death In Your Car?

Don't Be Like the Men Who Died of Thirst on Lake Superior Because They Thought the Water Was Salt.



BY F. L. PHILLIPS

EVERYONE has heard the fable of the hen who starved to death when she was put in a peck measure near a barrel of corn, and doubtless everyone has thought to themselves, "what a foolish hen." Still I think I can show many of the car owners that they are in a measure almost as silly as the hen.

I have seen automobiles operated during the winter time in the various cities with the occupants almost frozen to death, sitting in the seats trying to keep their feet warm, and piling robes over their knees; but failing to accomplish their object. These same people are the hens, and the barrel of corn is the engine.

Let me explain my reason for this bold comparison. The automobile engine is essentially a heat engine. Its operation depends upon the expansion of gases by heating, and with every explosion a tremendous amount of heat is generated. This heat ordinarily is carried through the exhaust to the manifold, where it is cooled by contact with the surrounding air. This much heat is wasted.

Of course we want to waste the heat in the summer

An Easily Constructed Two Heater Combination for the Automobile.

time, but if the car is operated during winter months it is foolish to send the heat through to the manifold. Why not run it up to a stove in the tonneau? And it is easy enough to do this.

In the figure is illustrated a combination of two stoves which may be used for a touring car, one in front beneath the driver's feet, the other beneath the feet of the occupants in the tonneau. It can be made by practically any tinsmith and fitted to the exhaust line by any car owner.

With the exception of the stoves themselves, the system is made of pipe fittings. The stoves shown at C and E are nothing more or less than sheet iron boxes measuring twelve inches in length, six inches in width and two inches in depth. These boxes are fitted with covers and the openings with floor plates threaded for a 1½-inch iron pipe.

At the end, the exhaust manifold is fitted a 45-degree elbow. One end of this elbow is plugged, while the 45-degree connection is connected through the pipe B to the hot-air stove beneath the driver's feet, shown at C. Through the pipe D the front stove is connected with the one in the tonneau, E, and this is connected through a length of pipe and elbows to the manifold. The old exhaust pipe, as shown by the dotted lines at G, can be removed until spring and then be installed.

The holes in the floor left after the removal of the two stoves can be covered by a flat piece of sheet iron. The covers to the two stoves should be fitted to the body of the stove and held by bolts so that they can be removed frequently for cleaning. All the hot gas from the engine must pass through the two stoves, consequently the stoves are warmed at all times.

If the car owner desires to control the heat in these stoves, the old exhaust pipe can be left in place and a butterfly valve fitted to the line B, as well as a butterfly valve to the line G. In this way any or all of the exhaust gas can be diverted to or cut off from the two stoves.

Upon the market at the present time are many such stoves. Our suggestion is only for those who like to work upon their own car or who do not have the money to purchase the manufacturer's article.

If you like this magazine and feel that it is useful and interesting, the *one best way* to show your appreciation, is to purchase your accessories and supplies so far as possible from our advertisers. Also write to our advertisers for catalogs, printed matter and prices, not forgetting to always mention the fact that you saw the advertisement in the Automobile Dealer and Repairer.

SOMETHING FOR FATHER

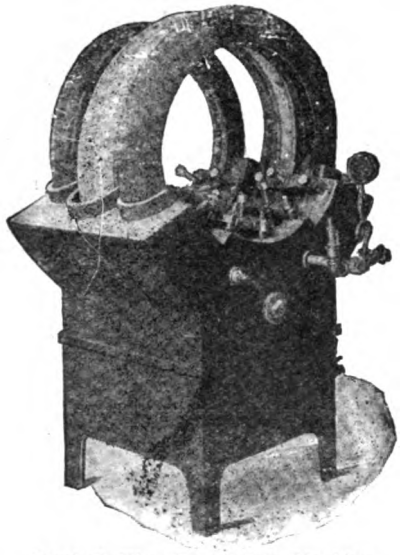
PERHAPS it is a bit too early for us to wish our readers a Merry Christmas, so we will defer this greeting until our next issue, which is to be the Christmas Number, and it is about this Christmas Number that we want to write.

Doubtless everyone of you is cudgeling his or her brains in a vain endeavor to think of some proper present for father or the rest of the family. We pride ourselves that we have solved the problem and we are so enthusiastic about it that we want you all to know what our solution is. Like every good idea, however, you can only

Digitized by Google

find it out by taking the magazine. In it we will tell you of proper gifts for the whole family.

Our advertisers have been asked to co-operate and we trust that after you have read the November Automobile Dealer and Repairer you will be able to purchase suitable gifts for Christmas, gifts that will be both pleasant and practical.



You know that we are doing all we can, every one of us, to win the war. We cannot afford to waste money. We cannot afford to spend our money foolishly, and so we want to purchase presents that are useful as well as ornamental.

You would not think of sending a costly photograph to the starving Belgians, or a piece of fancy millinery to the suffering Poles. You would try to send them warm clothing or something to eat. You can take our word for it that father will be more pleased with something for his automobile than he will with a pair of gaudy socks or a flashy necktie, and so we advise you to read our Christmas Number.

NEW AND INTERESTING THINGS IN MOTORDOM

Zwebell Tire Rebuilding Machine.

Never in the history of the tire business has the demand for rebuilt tires been as great as it is today. Urgent requests are made to the tire users to conserve their tires and eliminate the waste that in the past has run into enormous figures.

Zwebell Tire Rebuilding Machine.

It is a known fact that a large percentage of carcasses outwear the original tread and if retreaded are good for many miles of service. Owing to government regulation, eliminating a large number of the tire sizes now in use, will create a further demand for rebuilt tires that cannot be obtained from the manufacturer. With this demand is opened a large market for tire rebuilding and the up-to-date repairman or garageman will anticipate it by installing tire rebuilding machines.

The Zwebell Retreader and Tire Rebuilding Machine, as the cut shows, is a block type casting, capable of accommodating three large tires. The one-third circle cavities, with a cross section of 3½, 4¼ and 5¼ inches, respectively, will take care of any size tire from 28x3 to 38x5½ inches. The cavities are deep enough to cure the tire over the beads when desired. The boiler is self-contained and uses either gas or kerosene as fuel to generate steam.

The ends of the cavities are provided with semi-curing flanges, to guard against any breaks in the cure. The raised centers of the side of the cavities are so constructed that with the use of air bags and standard bead molds, a section can be cured in the same manner as in regular sectional molds in rib, or with a pad in either plain or non-skid design. Full particulars and description of this machine can be obtained by writing the manufacturers, Zwebell Brothers Co., Milwaukee, Wis.

A War Essential.

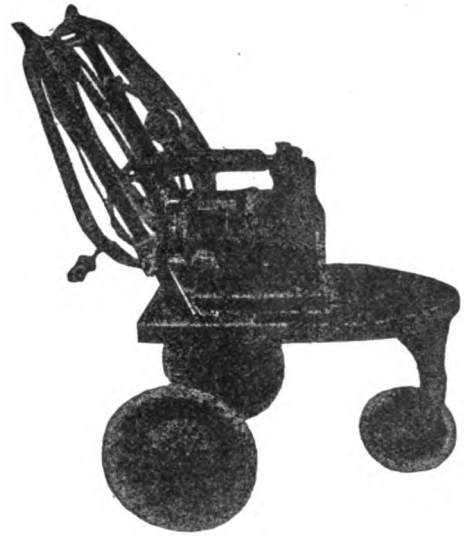
The Priorities Division of the War Industries Board, in Circular No. 19, dated September 3, 1918, has placed manufacturers of ball bearings and steel balls on the Preference List, with a rating of "Class B-3," conditioned upon their executing and filing pledges of co-operation with and observance of the rules of the Priorities Division.

Graphite as a Lubricant.

A microscope shows all metal surfaces to be irregular. The surfaces look like a nutmeg grater. Flake Graphite attached itself to the high spots, filling in depressions and forming over the whole surface a thin, tough film, unctuous to the highest degree, thereby preventing metal-to-metal contact and substituting the low frictional contact of graphite-to-graphite for the high frictional contact of metal-to-metal.

Dixon's Flake Graphite is said to be:

1—Unaffected by high temperatures.
2—Cannot be carbonized or ignited.
3—Cannot possibly give off explosive vapors.
4—Will not accumulate dust or grit.
5—Does not clog discharge valves.
6—Improves frictional surfaces.
7—Prevents metallic contact.
8—Reduces amount of oil or grease.
9—Reduces friction.
10—Prevents shut-downs.
11—Saves power and fuel.



Graphite as a lubricant is not a competitor of greases or oils. On the contrary, the two in most cases go hand-in-hand. Dixon's Flake Graphite is said to improve all oils and greases, the oils acting as a carrier to properly distribute the graphite. There are some cases where we do not recommend graphite as a lubricant, particularly if the lubricant must be a non-conductor of electricity, as graphite is a good conductor. And vice versa, there are some conditions when graphite alone works best.

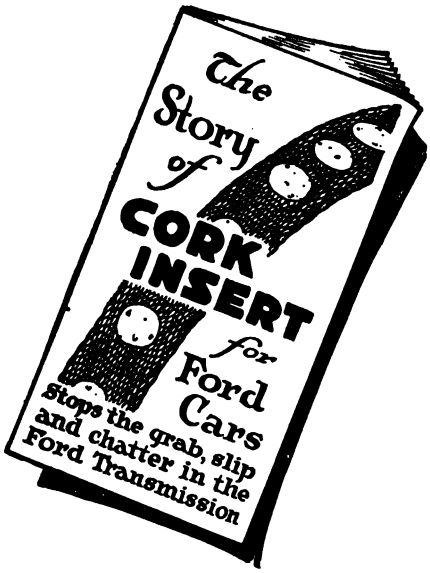
The proper use of Dixon's Flake Graphite will reduce the cost of cylinder lubrication at least 50%. This is no exaggeration either.

A mixture of Graphite permanently suspended in oil has no particular advantage over a non-graphited oil as a lubricating material because the particles of graphite, being in a perfect suspension, cannot break through the surrounding film of oil or easily become attached to the metal surfaces. They simply move about in the oil film without at all decreasing the viscosity of the oil itself, the only way in which any reduction of friction could be brought about. In fact, a mixture of finely divided graphite and oil has a higher viscosity than that of oil alone, and so reduction of friction is not to be sought along this line.

Lectroflater Carriage Outfit.

The Black & Decker Mfg. Co. of South Calvert St., Baltimore, Md., have just added to their line a No. 2 carriage outfit which should be of interest to automobilists and garagemen. This machine consists of the well-known No. 2 Lectroflater, mounted on a seamless steel tubing reinforced carriage, trimmed in nickel and driven by electrical current.

The New Lectroflater.



The carriage is fitted with three steel wheels, rubber tired, to be used on hardwood floors, and is exceptionally strong and convenient. With the machine is furnished 15 feet of flexible cord and 20 feet of air hose.

Ford Owner's Booklet.

A new booklet, just off the press, goes thoroughly into the question of transmission action of Fords. It tells how a smoother working Ford can be had, simply by taking proper thought in the purchase of transmission lining. The causes of the chattering and vibration which attends the transmission action in the Ford are analyzed, and the method of overcoming them clearly shown.

One of the features of the booklet, which is named "The Story of Cork Insert," is

views of the factory where Cork Insert Transmission Lining is prepared. The big machines are shown which punch 24,000 sets of linings in an 8 hour working day. Also the rooms of girls who are in the act of setting the corks into the linings, are shown. One girl can set 10,000 corks in a day.

Another department of interest is the pages which give the experiences of Ford owners in the use of Cork Insert. After reading of the long mileage secured and the smoothness and quietness of operation, it is not difficult to understand why Cork Insert Transmission Lining has come into more extensive use during its first year on the market than any other automobile accessory ever offered the public.

A copy of the booklet, "The Story of Cork Insert," will be mailed gladly to any reader of this journal, who will address request to Advance Automobile Accessories Corp., Dept. J5-1, 56 E. Randolph St., Chicago.

Handy Auto Brush.

Auto owners in general, and particularly owners of commercial garages and auto fleets will be interested in the Water Spray Auto Brush now being marketed by the Scully Jones Company of Chicago. A brush of the best grade of bristles, circular in shape, has a hose connection in the center through which water is sprayed.

The part patented consists of an aluminum valve forming the handle of the brush and controlling the flow of water as the brush is used. An opening in the bristles enables the user to direct a spray of water at a distance and increase the volume as desired.

To use like a sponge the spray is reduced to the amount necessary, the water coming through the bristles keeps them free of dirt, washing it off the car without scratching.

An extension handle adapts the brush to work on auto tops and places inaccessible by hand.

Large fleet owners, including the Armour organization, have tested the brush thoroughly and are using it in place of sponges, as it does the work better and quicker at a big saving in initial expense, in labor and time.

The Scully Jones Company is planning an extensive advertising and distribution campaign.

Steven's Catalog.

Stevens & Company of 375 Broadway, New York City, have just issued a new catalog of their line of products which should be in the hands of every automobile accessory buyer. Stevens Products are well known throughout the industry and consists of a wide range of automobile accessories. Write for the catalog; it's free.

The Modern Motor Car.

A book which the trade has been looking for for some time is now being published by Laird & Lee, Inc., Publishers, Dept. A D R., Chicago, Ill. and entitl d "The Modern Motor Car." It contains 536 pages and is illustrated with 225 cuts.

It has been written from a practical standpoint and takes up in detail the construction and repair of every automobile part. Electrical systems, "that mysterious part of the car," are gone into in great detail. The storage battery is fully described and hints for its upkeep and repair given.

As a book of condensed information and practical mechanical textbook it stands with the best. It is concise and to the point and we can safely recommend it to our readers.

Automatic Extension Reel.

It is safe to say that at least one hour a day is wasted in hunting for or repairing the drop lights in a garage. There is also a great fire hazard when insulation is worn from the wires by contact with sharp objects and immersion in oil and grease upon the garage floor.

All trouble and danger is eliminated by the installation of the Automatic Extension Reel, manufactured by the Cincinnati Specialty Mfg. Co., Sylvan Ave. and Powers St., Cincinnati, Ohio. This device can be attached to the wall or celing of the garage and consists of a reel and a length of flexible lamp cord to which is attached the portable light.

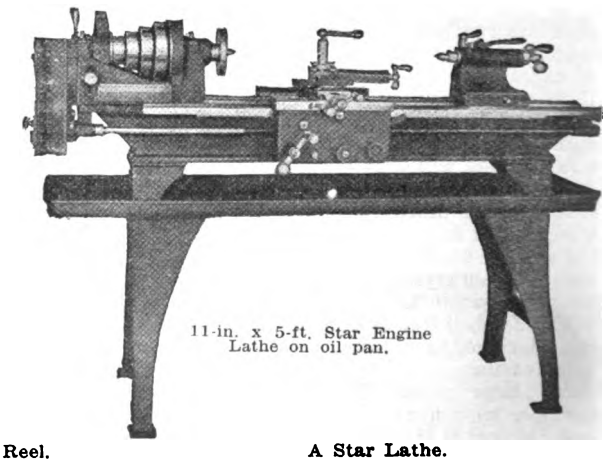
The light can be drawn to any distance within range of the cord and upon release the cord winds back upon the reel. The cord cannot drag in the oil or water upon the floor or get in the way of other machines, and the light is always where it is wanted. The device is strongly made and should be in every garage.

Automatic Extension Reel.

A Novelty Gasoline Tank.

A gasoline tank with no liquid in it is a sentence descriptive of a new invention worked out by two elderly Brooklyn men. This invention should prove very adaptable to airplane service for many reasons.

It is a tank made of aluminum, in which are placed enough Balsa wood blocks to fill it. This wood is lighter than cork and very porous. The four sides of each block are grooved to provide for air circulation. With the tank assembled, gasoline is poured into it and the wood blocks absorb a large amount. The top of the tank is fitted with two pipes, one for air inlet, the other for connection with the engine.



In operation, air is drawn through the tank past the blocks which give off the stored gasoline, mixed with air, to the engine, thus doing away with the carburetor.

The inventors claim that even if the tank is punctured with holes, it still functions properly until all the gasoline is exhausted. Should a bullet puncture such a tank, were it fitted to an airplane, the gasoline could not pour out and ignite as at present. Such an invention presents many interesting features.

Star Lathes.

In this number is printed the third instalment of the Metal Turning Lathe, an article which shows how necessary and practical this machine can be made for a garage, or even for the car owner. We call the attention of our readers to the Star Lathe made by the Seneca Falls Mfg. Co., Inc., 383 Fall St., Seneca Falls, N. Y.

This machine sells at an exceptionally low price and is a fine machine. The 11-inch-by-5-foot machine should be suitable for any garage where quality work is desired. Upon this small machine can be done many jobs and the repairman will soon find that it will pay for itself in a short time. Readers interested in garage equipment should write the manufacturers for a copy of their free catalog.

A Star Lathe.

Jefferson Coils.

The Automobile Ignition Coil situation has, in the past, been a serious problem for jobbers, dealers, and service stations, owing to the multiplicity of types on the market. Many jobbers and dealers have had to pass up the coil field almost entirely because of the large and varied stock

A Jefferson Coil.

of Coils that would be necessary to take care of all requirements.

The Jefferson Electric Manufacturing Company of Chicago have recently placed on the market a line of Battery Replacement Coils and Fittings which are sufficiently flexible to displace any type of Coil on battery equipped cars. The extreme flexibility of Jefferson Coils is obtained from several features, which include the Fittings, Adjustable Caps, Terminals and Mounting Arrangements.

With a small stock of Jefferson Coils, any service station, garage, or repair shop will be prepared for any emergency. Heretofore it has been necessary to lay up a car for perhaps several days while a new Coil was being obtained. Now, however, any car can be placed in service within a few minutes. It is only necessary to remove the old Coil and connect the Jefferson.

Starting conditions require a Coil that will produce a hot, intense spark when the battery is at the lowest ebb. Jefferson Coils are guaranteed to take care of this extreme condition.

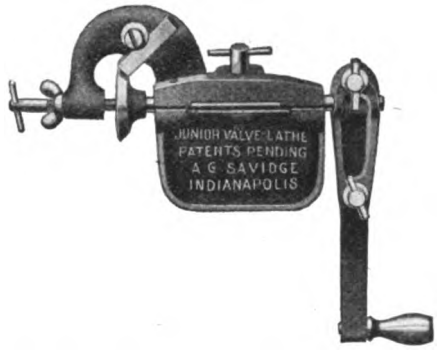
To aid jobbers, dealers, service stations, and garage men, the Jefferson Electric Manufacturing Company have compiled a folder containing complete and authentic data covering all standard Battery Ignition Systems. This folder lists all makes of cars from 1912 to the present date, and gives the year, model, type of ignition, and style of Jefferson Coil to be used for replacement. This folder will be sent free of charge to any dealer, garage, service station, or jobber. Request should be addressed to the Jefferson Electric Manufacturing Company, Congress and Green Streets, Chicago.

Steer Warms.

Cold hands are not conducive to comfort nor safety in driving an automobile and the driver cannot always afford to swathe his hands with thick heavy gloves which hamper his movements.

The Interstate Electric Company, Dept. 108, New Orleans, La., have solved the problem and offer an attractive device called "Steer Warms." This accessory consists of two neat leather-covered grips, studded with metal plugs and protected by brass plates, which clamp and lace upon the steering wheel.

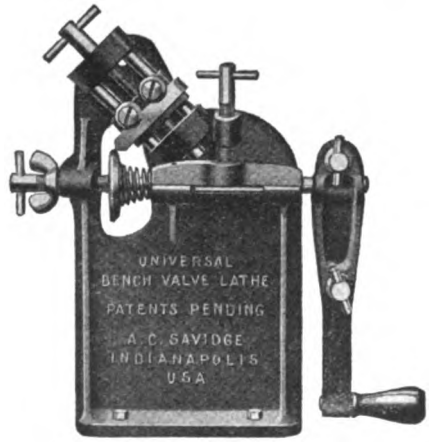
Through a switch and wires, these units connect with the storage battery, or in the case of the Ford car with the magneto, and with the switch on, the current heats the units to the proper temperature. But little current is required and it is claimed that there is no danger of overheating. These little comforts make a fine present for Christmas, their cost is little, their utility great.



Greater Facilities.

The France Manufacturing Company of Cleveland, Ohio, makers of F-F Battery Boosters for charging storage batteries from both alternating and direct current, has just moved into its new factory building on Berea Road, oposite The Winton Motor Car Company's plant.

With its greatly increased facilities the company is now in a position to make prompt shipment of its products to all parts of the Allied World. Inquiries concerning F-F Products will be appreciated.

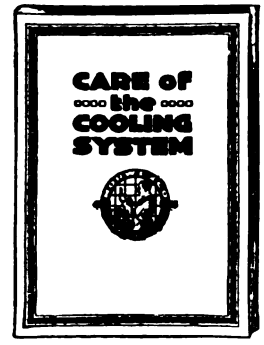


Savidge Valve Lathes.

As every repairman knows, once a valve has been ground out of shape it cannot be restored satisfactorily by grinding. This operation will only spoil the valve and damage the seat until the block is nearly worthless. Usually a valve in this condition is thrown away and a new one ground into place; a needless waste of material.

Savidge Junior Valve Lathe for Small Engine Valves.

The A. C. Savidge Co. of Indianapolis, Ind., have perfected two valve lathes for recutting or refacing valves which are of great interest. The first is designed for large valves while the second, known as the Savidge Junior, is intended for cutting smaller valves. As the illustrations show,



The Savidge Universal Bench Valve Lathe Set.

both machines are operated by hand, the handle is mounted on the valve stem and the cutting tool adjustment turned with the fingers until the whole face of the valve has been restored.

The action of the machines is clearly shown in the accompanying illustrations.

Care of the Cooling System.

The average motorist spends little time in trying to maintain the running efficiency of his car. This is especially true in caring for the cooling system, which is more important than the average motorist thinks, yet it is generally neglected. If the cooling system is not kept clean and free from

The New Norwesco Booklet.

leaks it impedes the efficiency of the engine and increases its cost of operation.

The Northwestern Chemical Company, of Marietta, Ohio, makers of the NORWESCO line of "Chemically Correct" Automotive Equipment, have issued a 20-page booklet entitled "Care of the Cooling System."

This booklet conforms to its title, giving the motorist many practical suggestions and valuable information which will assist him in giving proper care to the cooling system. A copy of this booklet can be secured, postpaid, by writing The Northwestern Chemical Co., 1309 State St., Marietta, Ohio.

Goblin Soap.

"I can always tell whether a man uses Goblin Soap by looking at his hands," says a dealer in automobile accessories. Every reader who owns an automobile or does repair work knows how hard it is to remove that line of crepe from around the finger nails and how difficult it is to wash out the grease from the pores of the skin.

Goblin Soap, manufactured by Cudahy, 111 West Monroe St., Chicago, Ill., is claimed to dissolve greasy dirt and remove it from the pores without injuring the skin. The manufacturers say that it will dissolve in any water, hard or soft, warm or cold, and that it answers the soap problem.

Economy and Oxigene.

The New York *Herald*, supported by the Automobile Club of America, has just conducted a series of tests on various devices for the conservation of gasoline. These tests were held on October 2nd, 3rd and 4th at the Motor Speedway, Sheepshead Bay, Brooklyn, New York.

The technical committee consisted of three men well known in automobile circles. Mr. Richard Kennerdell, chairman, is a member of the contest board of the Automobile Club of America. Mr. W. H. Stewart, president of the Stewart Automobile School, and Mr. H. S. Tarantous, technical engineer of *Motor Magazine*. Mr. Hugo C. Gibson and Mr. George W. Henham, both members of the Society of Automotive Engineers acted as engineering experts for the affair.

Twenty-nine cars were entered. There were 19 devices tested. Of these some were carburetors, both for gasoline and kerosene, some were special spark-plugs

Give Him Something for His Car—Of Course

Aren't you proud of your new shiny automobile?

Isn't it just the best thing you have ever owned?

Doesn't it belong to the whole family?

Of course it does!

Wouldn't it look nice if it had a pretty, new spot-light on the windshield?

Wouldn't you be nice and comfy riding in it this winter, if it was equipped with a stove for keeping your feet warm?

Why can't you give each other practical presents for Christmas, gifts that can be used on the family car?

Don't miss the November Christmas number of the Automobile Dealer and Repairer—it will help you solve the Christmas present problem.

It will tell you what to give father, mother, brother, sister and the kiddies.

There will be lots of special advertising by my special friends in it too—and so you can help me out by picking just what you want for Christmas.

Yours for a happy, joyful and economical Christmas.

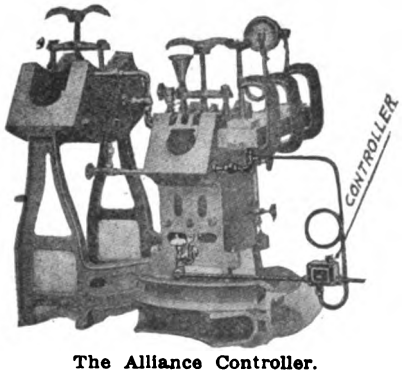
MOTOR VEHICLE PUBLISHING CO.

71-73 Murray Street **New York City**

Digitized by Google

and some were special kerosene devices. Of the large number of auxiliary fuel gasoline savers which are now on the market, and the total of which is probably well over 100, only three were entered in the test, although practically every one received an invitation to join in this great opportunity to prove the value of their products. Oxigene was one of the three and that it came out with flying colors can be seen by referring to the tests printed elsewhere in this magazine. The tests show that at a speed of ten miles an hour the saving due to Oxigene was 55 per cent. At twenty miles an hour, 47 per cent. At thirty miles an hour, 50 per cent. The average saving for the three speeds was a little over 50 per cent.

Although many extremely satisfactory private tests have been made, this is the first contest in which Oxigene has had an opportunity to make a sweeping public demonstration of its great practical value in saving gasoline. The fact that, in addition to this big saving in the actual fuel, it also prevents entirely the formation of carbon, makes Oxigene a wonderful boon to all users of motor cars or trucks. This fact will become more and more evident as the motoring public becomes familiar with it. Oxigene is manufactured by the Miller Chemicals, Inc., and sold by Stewart & Co., 349 West 26th St., New York, N. Y.



Ironclad Kraki Twills.

The Franklin Manufacturing Co., 132 Market Place, Baltimore, Md., announce that they are manufacturing a cloth that wears like leather and is known as Ironclad Khaki. From it may be made overalls, shirts, pants or any other clothing that is required for real service.

This announcement should be of interest to our garage and repairmen readers, all of whom are invited to write for samples of the cloth which is made in specials for both men and women.

The Alliance Controller.

Perfect control of the heat in a vulcanizer is necessary before the repairman can hope to secure satisfactory results when repairing tires. The older makes of vulcanizers were not fitted with automatic controlling devices, and the operator often

The Alliance Controller.

spends valuable time attending to the regulation.

With an Alliance Controller attached to a steam vulcanizer, the repairman need not worry about the steam pressure. He knows that the moulds will never get too hot, or the steam pressure rise too high. This device is manufactured by the Alliance Controlling Co., Main St., Alliance, Ohio, and can be attached to any steam vulcanizer.

It automatically controls the gas flame beneath the boiler. As the pressure rises, the gas is cut down in proportion until the correct steam pressure is obtained, thereafter the controller keeps the pressure constant. The pressure control can be altered within a certain range by a special key. It is very simple and guaranteed to give satisfaction. Once installed and set, it needs no further attention.

The manufacturers claim that with the installation a large saving of gas is had and that there is no worry about uncertain pressure nor explosion.

MEETS A VERY SEVERE TEST.

Vaporizer Comes Through With Flying Colors.

Mr. L. Lewis of 75 Grampian Way, Dorchester, Mass., has been using an Olsen Kerosene Vaporizer for some time on his Ford sedan around Boston. Recently he put it to a strenuous test, when he took a 120-mile round trip to New Hampshire. When queried about the performance of the Olsen on this trip, Mr. Lewis stated that he could not praise it too highly.

"On the trip," he said, "I got into some awful going and went through 12 miles of flood and very deep mud, on low gear. The car came out of it as sweet as when she went in.

The heat from the vaporizer gives such a hot, dry gas that you can run your engine slower than on gasoline. On gasoline the engine would miss and sputter, but with the Vaporizer it is as regular as clock work.

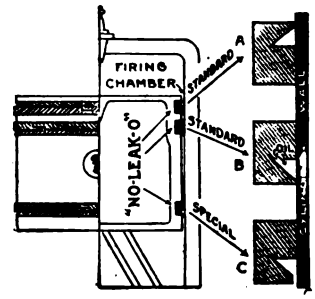
For a number of years we have had devices supposed to do what the Olsen actually does do, but none of them have done it. People are astonished to find that the Olsen does the work without soot or carbon, smoke or smell. The engine starts right off and in about a minute I turn her over on kerosene. I can climb hills better with the Olsen than when running on gasoline; the engine never stalls. Moreover, if you burn gasoline with the Olsen, you will get much better results than before, because the Olsen is better able to utilize the inferior gasoline we get to-day.

I have had absolutely no lubrication troubles. I looked for this at first, because I know it requires a great deal of attention, but the Olsen has a clean record. Inferior gasoline does lead to lubrication troubles, but the Olsen so thoroughly vaporizes the kerosene that lubrication troubles are impossible with it. Combustion is simply perfect and the kerosene is used up to the very last drop.

If people knew how good the Olsen really is, there would be a line of Fords a mile long waiting their turn to get one. Indeed, if it were only half as good as it is, I should still be an Olen booster."

Tire Economy Conference.

A very interesting four-day meeting of the Automobile Tire Economy Conference was held at the Congress Hotel, Chicago, late in September. This conference marked the first national organization of a firmly established industry, that of tire fillers.



Prominent representatives of the War Department, American Red Cross, Y. M. C. A., Salvation Army and various Federal and State economy boards addressed the conference and all agreed that motor transport was of vital importance in winning the war. The practicability of tire fillers was discussed and it was agreed that if all truck and pneumatic tires were replaced with filler, that much time and money could be saved.

No-Leak-O Piston Ring.

In the September number of The Automobile Dealer and Repairer were described the No-Leak-O Piston Rings; through a typographical error a mis-statement was made. A correct description of the action follows:

When No-Leak-O piston rings are used dirt from the explosion, carbon and fuel are prevented from leaking into the oil base by the patented oil sealing channel. At the upward stroke, by capillary action, this dirt is carried into the firing chamber and ejected with the exhaust, rather than into the oil pit.

Since the September article appeared the

name of the manufacturers has been changed to that of No-Leak-O Piston Ring Co., the address remains as before, at 824 W. North Ave., Baltimore, Md.

Standard Motor-Pep.

Every reader realizes that present-day fuel is not what it was a few years ago, that it does not vaporize readily, that it dilutes the lubricant in the base of the engine and that it does not give high mileage.

The Utilities Co., 310 Citizens Building, Cleveland, Ohio, claim to have solved the problem and are introducing their product called "Standard Motor-Pep," a scientifically compounded composition in tablet form which is designed to be dissolved in the gasoline. If directions are followed, it is claimed that more mileage is obtainable, fuel bills are cut and that the engine will start easier and run smoother than ever before. In addition to these advantages, Motor-Pep is said to eliminate carbon.

Garagemen and dealers should investigate the special proposition given by this concern in their advertisement in this magazine. Car owners should write for a sample.

The Rex Oil Cup.

Automobile manufacturers and engineers have at last decided that oil is more preferable in certain cases than grease, especially upon springs, spring bolts, and other important parts. A number of machines are being put on the market which are fitted entirely with oil cups rather than grease cups.

Frank X. Devlin, 198 St. Clair Ave., Detroit, Mich., is putting a patented Rex, all enclosed oil cup on the market to replace the regular grease cup installation on the older cars. This cup is made in a number of models and sizes and designed to be applied to any position in place of grease cups.

The Rex cups may be obtained with threaded nipples or with a special nipple which can be driven into a drilled hole without threads. It is simple in construction and made of the best of material. The covers are dust and water tight and held closed by strong springs. Every automobile owner or repairman should familiarize himself with this line.

GREASY dirt is the hardest to remove; ordinary soap doesn't touch it. If you'll try Goblin Soap the next time you get a bad case of dirty hands you'll have a pleasant surprise.

Goblin Soap is a splendid all around soap for toilet, bath, kitchen, garage, shop, — anywhere where there is dirt to be removed without injuring the skin. Try it.

It lathers quickly and easily in any water, hard or soft, warm or cold; it's gentle and thorough.

For Toilet or Bath

JUST WHAT I WANT

Automatic Extension Reel

For Electric Lamps

Take your lamp with you to any part of your machine shop or garage—an automatic lock holds the lamp at any desired distance from the reel. It can't get out of order because it's professionally manufactured.

Tisn't a half-baked proposition nor an amateur outfit—but a splendidly strong Extension Reel for men who haven't got time to bother with any nonsensical makeshift. Equipped with 25 feet of reinforced cord. It's all good quality—don't cost much either. Approved by the Underwriters.

Write for Particulars

The Cincinnati Specialty Mfg Co., Inc.

Sylvan Ave. and Powers Street - CINCINNATI, OHIO

Neatsfoot Oil—Past and Present.

In former days when oil was wanted for softening harness or other leather articles, pure Neatsfoot was always recognized as the best for the purpose and was used freely.

With the advent of the motor car, the use of Neatsfoot Oil was found to be very beneficial in softening the leather facings on the clutches. Great quantities were used annually for this purpose and gradually the demand began to exceed the supply. Then, as prices advanced, substitution was resorted to. Manufacturers, careful of their reputation now announce upon the labels of the containers in readable type that the contents is a Neatsfoot Compound or Mixture. Other manufacturers use labels upon which the word "Neatsfoot" is displayed prominently in large type while the word "compound" or "mixture" requires a magnifying glass to find it. Still other manufacturers continue to put out a package labelled "Neatsfoot" or "Neatsfoot Oil" in which the percentage of real neatsfoot is so small that it is a joke to use the word Neatsfoot in connection with it at all.

Of course, manufacturers cannot be censured for putting out substitutes for an oil which through scarcity, has become so valuable. In justice to the public as well as themselves, however, they should label the containers truthfully. They also should be certain that it will do the work of pure Neatsfoot for which it is substituted and do it without any detrimental action.

So bad has the situation become, that many of these alleged Neatsfoot Compounds contain no Neatsfoot whatsoever, and are composed principally or wholly of mineral oil which is the cheapest oil available.

Mineral oil is not considered of the highest value in softening leather as, while it readily penetrates and makes it pliable, the effect is not permanent. Mineral oil does not remain in the leather but comes out again about as quickly as it goes in. Neatsfoot Oil on the contrary, penetrates and is absorbed by the leather remaining in the fibres and keeping it flexible.

The Frank Miller Co., of 349 West 26th Street, New York, is putting up a Neatsfoot Mixture which not only is distinctly labelled but which is composed of a fair proportion of real neatsfoot oil blended with other animal oils of recognized value in softening leather. There is some mineral oil in this mixture, but great care is taken to use only neutral oils which are entirely free from acid.

This mixture, which his put up by a firm long recognized as extremely particular with regard to the high quality of their products, is so compounded that it has many of the properties of pure Neatsfoot Oil. It softens leather, and is rapidly absorbed leaving a flat surface of good holding qualities as is required for a friction clutch.

Large Welding Shop.

Manufacturers who have government contracts to make tanks, cans, containers, ovens, etc., which require the joining of metal to metal, can secure unequaled service by arranging to have their work done in the new Welding Shop just opened by the Imperial Brass Manufacturing Co., Chicago.

This Welding Shop is one of the finest and most thoroughly equipped in the country and maintains a staff of expert welders who are in a position to help manufacturers to make prompt deliveries, keep up production and reduce manufacturing costs. The Oxy-Acetylene Welding process used in this shop is far superior to riveting in making metal joints.

Broken automobile parts and machinery of all kinds are also quickly repaired at the Welding Shop which is perhaps the largest in the Middle West. This department occupies a new building 50x 150 feet, erected especially with a view to speeding up government contract work, and is ready to give exceptional service. Those interested in securing such service should write to Imperial Brass Mfg. Co., 1200 West Harrison street, Chicago.

The Autoreelite.

A device which may be termed the "Motorist's Friend" and a three-in-one utility is being manufactured by the Anderson Electric Specialty Co. of 118 S. Clinton St., Chicago, Ill.

The Auto-Reelite is a combination spot and trouble light and is permanently connected with the storage battery and mounted upon the windshield. A turn of the knurled nut releases the light so that it can be carried to any part of the automobile. Inside the fitting is mounted a strong, spring reel upon which is wound 12 feet of cord which winds automatically when the light is returned to the socket.

The light may be obtained fitted with a rear-view mirror or plain, in a number of sizes. With the lamp is furnished three pairs of windshield clamps for round, oval or rectangular frames. The whole device is simple, ornate and handy and a practical fitting for any car.

Johnson's Freeze Proof.

The sharp fall mornings remind us that winter is fast approaching and the enterprising dealer will begin to lay in his store of winter accessories, for very shortly automobilists will begin to demand winter equipment.

Now is the time to open a campaign for the sale of radiator non-freezing solutions and one product that is attracting universal attention is manufactured by S. C. Johnson & Son, Racine, Wis., termed "Johnson's Freeze Proof."

This product, like all of Johnson's products, has been carefully tried out by actual experiment. It is claimed that Freeze Proof has no chemical effect upon metal or rubber, that it is non-acid and that if used according to directions there is absolutely no danger of a radiator freezing.

Freeze Proof is bound to be very popular this winter, for the very reason that an extensive advertising campaign is being carried on through popular magazines and widely circulated publications like the Saturday Evening Post, Cosmopolitan, and the American Magazine. The dealers are offered a very attractive proposition and the price is so low that it offers a ready sale to all motorists.

Rain-Sno Windshield Cloth.

The Suffolk Manufacturing Co., Inc., Dept. C, 69 Long Wharf, Boston, Mass., are marketing a product which is termed Rain-Sno Clear View Windshield Cloth. This cloth is chemically treated and once it has been rubbed over the surface of the windshield it is claimed that no snow or moisture will collect for a certain length of time. The cloth is guaranteed to give continuous use for one year and should be investigated by every automobile owner.

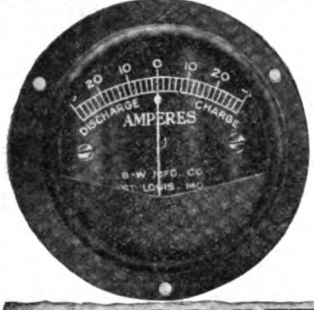
Odd or Irregular Sizes
BRAENDER TIRES

Trade Mark

The manufacture of many odd or irregular sizes and types of tires has been discontinued as a conservation measure on the order of the War Service Committee of the War Industries Board.



We have many of these odd or irregular sizes in stock that were manufactured previous to the date when this order became effective. We have also the list of many odd or irregular sizes in the hands of our various dealers.

If you use odd or irregular sizes, send at once for prices and further information.

BRAENDER RUBBER & TIRE CO.,
RUTHERFORD, N. J.

Big Business—Splendid Profits

Zwebell Retreader and Tire Rebuilding Machine

Auto Owners and Dealers—Send us a tire with good fabric and Bead

We will retread and return for your approval.

PATENT PENDING

Never in the history of the tire business has the demand for rebuilt tires been so great as it is in this day of eliminating waste. You don't have to create the field—the field for your action is already created—it is a tremendous one and only waiting for more men. There will be no long drawn-out delay—you can go at it right now. We will post you on every point in rebuilding tires in sections and complete. This outfit pays for itself in so short a time, that it's surprising that anyone should hold back at all. It is a permanent business that will grow along with you as long as you live and then some. **The Zwebell Retreader** Has the Widest Range of Usefulness of Any Tire Machine on This Earth—It Has No Equal. Big designing engineers say so, and you want the best or none at all. Did you ever see a tire repairman who didn't have *more* than he could attend to? What are *you* doing—looking at the other fellows getting all the money and you just folding your hands? We will put you in "the swim" quick but you must write us a letter today—and don't fail to do it. We will explain everything—nothing will be left untold. This is the logical business for the Automobile Dealer, Garageman, Filling Station, to go into during this time—Conserve. Send for sample section of work done on this machine.

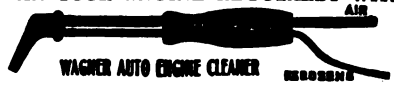
Valuable Free Booklet.

If our subscribers are interested in winter driving they should write S. C. Johnson & Son, Dept. A. D. R. 9, Racine, Wis., for their latest booklet relative to the radiating systems of automobiles, trucks and the cooling systems of farm power machines.

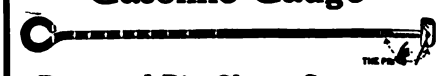


This little booklet contains many suggestions of value to anyone who works or runs gasoline engines. The product known as Johnson's Freeze-Proof is described and the booklet tells all about it. Freeze-Proof will protect the cooling system to 50 degrees below zero; it will not evaporate; it will not clog the radiator nor damage the metal, rubber hose or any other part of the engine. The cost is so low that every reader should investigate it. At any rate he should have the booklet, which is sent free upon application.

EMPRESS OIL and GREASE CUPS

BOWEN PRODUCTS CORPORATION, Auburn Division,
Successors to BOWEN MANUFACTURING COMPANY, Auburn, N.Y. *Catalog on application.*

CLEAN YOUR ENGINE REGULARLY WITH A



One qt. kerosene and 6 lbs. air pressure cleans all dirt, grit and grease from engine. Prevents wear, actually saves half the usual repairs. Quick, economical, thorough, easy and cleanly to operate. Necessity for repair shops.
Wagner Specialty Co., 1962 Broadway, New York City

Whiting-Adams Brushes.

The automobile owner or garage man who is disgusted with the automobile brush he is now using should investigate the line of brushes made by John L. Whiting-J. J. Adams Co. of Boston, Mass.

These brushes are made of the highest grade bristles and hair, prepared by special processes which retains the toughness and elasticity of the fibre. Every bristle is held firmly by its setting of rubber, vulcanized into the base of the bristles in a solid mass. Interested autoists should send for an illustrated catalog.

New Amazon Cord Supertire.

A new, massive cord tire has just been announced by The Amazon Rubber Company of Akron, Ohio, which will be called the "Amazon Cord Supertire."

Of multiple ply construction, each cord is separted from the others by an insulation of rubber—each cord performs its functions independently, friction and consequent heat are impossibilities. Its increased air space gives unusual buoyancy and resistance to stone bruises.

Almost three-quarters of an inch of sturdy side-wall above the bead makes it mechanically impossible for rim cuts to occur. The heavy tread is of the same design and compounding as the regular fabric Amazon Supertire.

The new cord has a jet-black, ebony tread with a broad pearl grey side-wall, and at present is being made in the following sizes:

34 x 4½, 36 x 4½, 35 x 5, 37 x 5 and 36 x 6.

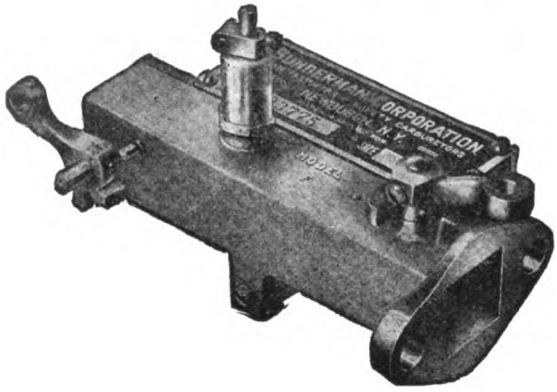
Motor Truck as an Aid to Busines

The A. W. Shaw Company, 461 Fourth Ave., New York, as well as of Chicago, Ill., recently published an interesting book entitled "The Motor Truck as an Aid to Business Profits." This book should be in the hands of every business man who operates a fleet of trucks or even a single machine. It tells how to figure truck costs, how to cut down operating expenses, approximate oil and fuel costs, and gives many actual examples of truck operation.

The book is bound in blue library buckram, contains 540 pages, 335 photographs and drawings, charts, folded inserts, blue prints and tables touching every phase of the motor truck's relation to the profit side of any enterprise.

Weaver Garage Equipment.

We want to call the attention of our readers to the interesting line of garage equipment carried by the Weaver Manufacturing Co. of Springfield, Ill., and ask them to write for an illustrated catalog, if they are in the market for garage appliances.



Especially we mention the Weaver Towing Pole, a device which will be appreciated by anyone who has ever had to tow a disabled car by means of an ordinary line, with the attendant possibilities of collision and other dangers.

The Weaver towing pole is of special design and fitted on each end with wide malleable sockets, padded with leather to prevent damaging the paint of the cars. Heavy straps of the best harness leather, 30 inches in length, give the pole a practically unlimited range of application, either to axle spring or frame.

While the pole itself is sufficiently rigid to enable the one car to control the other, the heavy coil spring cushions all pulling or jamming shocks, so that there is no jerk or jar on either car. This spring is double acting and is of the proper tension to respond to the weight of any car.

SUNDERMAN
Vacuum Carburetor

Model F — *For Ford, Metz and Saxon Four* — F. O. B. Newburgh, N. Y. — **$7.50**

Model BB—for all other cars—without connection **$10**

With regular connection **$12**

The Sunderman Saves More Than Your Share

It Makes "Slacker" Motors Hustle

THE advertising of the Sunderman Carburetor for the last two and a half years has persistently enunciated the great principle of gasoline conservation.

The need for saving gasoline is now three years old—it was the fall of 1915 that saw the rapid increase in price that told of demand nosing out supply.

Now the Government Speaks

In no uncertain tones, even though they are velvety in their soft suggestion, the Fuel Administration says "save gasoline." Your saving must go a step beyond your patriotism now—you must save; you have no option about it—we need the gasoline to help in winning the war.

Let Your Patriotism Be Intelligent

The Sunderman Carburetor will save far more gasoline on your car than the authorities hope to get from you in its one "gasless" day a week.

It will save it without sacrificing anything—it will give even more power and more flexibility—and while saving the gasoline and keeping your car running it will save on a busy car more money than is needed to pay whatever tax the government may impose.

Dealers, You Must Point Out the Way

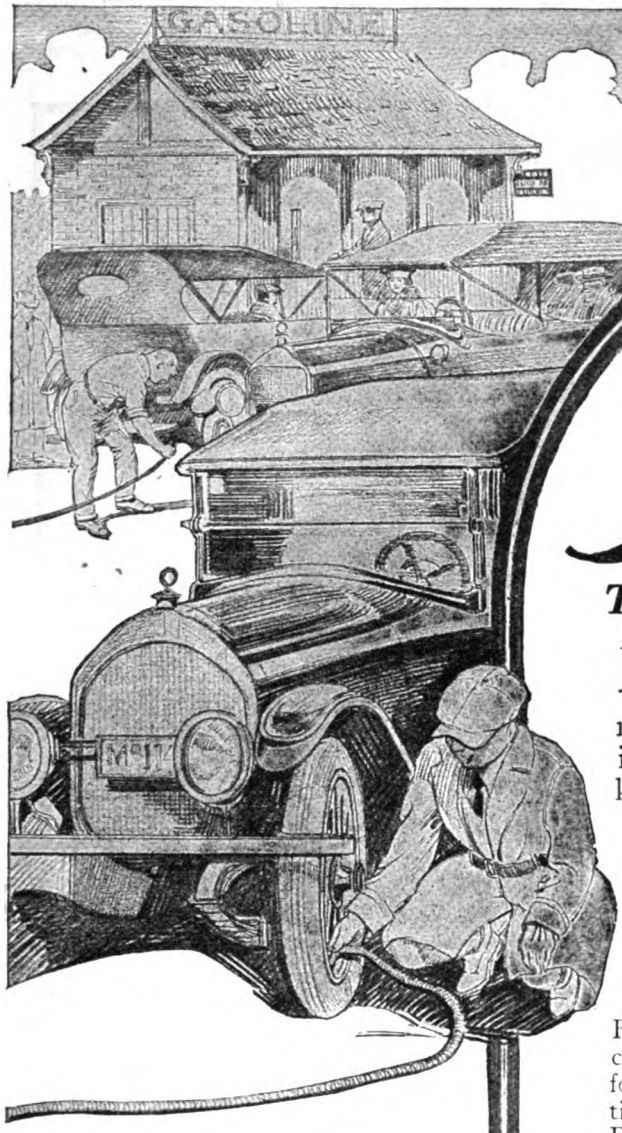
The Sunderman principle of carburetion automatically saves gasoline. It saves from 30 to 50% on any car—and is saving even a greater percentage on the cars of thousands of satisfied owners who send us enthusiastic, unsolicited testimonial letters — we receive them in every mail.

There is far more power in gasoline than the ordinary carburetor gets out of it. The ordinary mixture is not fine enough. No matter how you skimp down in throttling—no matter to what degree of leanness you adjust—you cannot get the power out of ordinary carburetors unless you feed more gasoline.

The Sunderman Gives MORE Power With a LEANER Mixture

Our carburetor vaporizes the gasoline. It breaks up the gasoline particles to infinite fineness, until only a gas cloud enters the combustion chamber. But this gas cloud is all power—and the result is a greater amount of driving force from the same amount of gasoline. Or, the same amount of driving force from a smaller amount of gasoline.

It saves without sacrificing power—and at the same time furnishes a "snappier" mixture that means a wider flexibility, a faster getaway and all the other ideal attributes of good carburetion.



Ask your dealer—or order at once from us.

Dealers: Don't wait for our Salesmen to call—Send us a sample order at once.

Sunderman Corporation, 13 Chambers St., Newburgh, N. Y.

PACIFIC COAST BRANCH: 593 MARKET ST., SAN FRANCISCO, CAL.

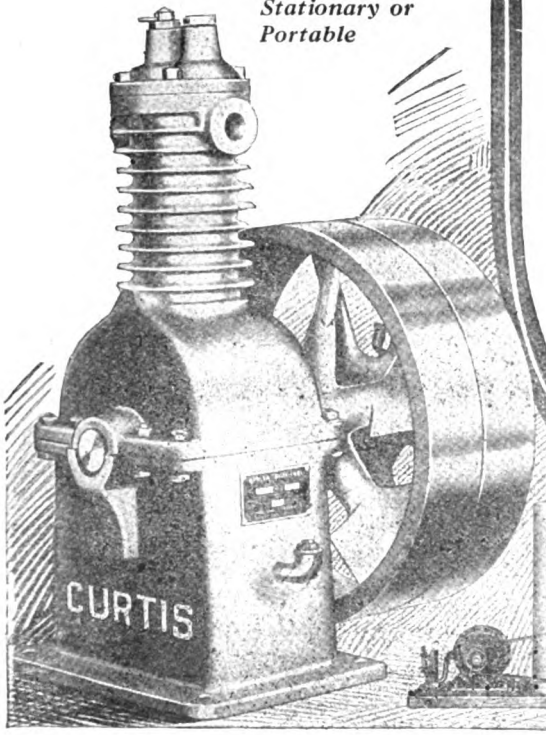
CURTIS ST. LOUIS

FREE CURTIS-AIR FREE FROM OIL

This Sign



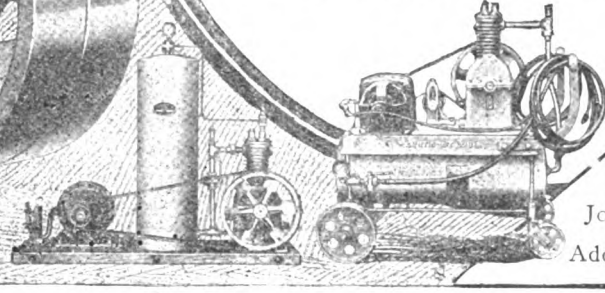
Talks Tire Conservation

IT is furnished free with each CURTIS Garage Air Compressor and can be had in no other way. It's a sign of progress—inspires confidence and carries a slogan known to motorists the country over.

Install a Curtis Air Compressor

Furnish your patrons with CURTIS AIR—FREE FROM OIL—and watch the cars line up before your curb. Motorists know that the average air compressor forces oil through the air line—they know that oil rots tires, and they are looking for CURTIS AIR—FREE FROM OIL—because it helps them get greater mileage out of their tires and cuts down expenses—big items in these days when tire prices are steadily advancing.

Five sizes—Stationary or Portable



Exclusive Curtis Features

Patented controlled splash oil system. Less oil required. No grease nor oil cups. AIR FREE FROM OIL. Large fan fly-wheel keeps compressor cool. Hand unloader permits starting against pressure. Bearings renewable, adjustable, non-cutting. Fewer parts—reducing maintenance cost. Easiest to install—no special base required.

Ask your jobber—or fill out and mail us the attached coupon for full information.

FORMING and TEMPERING

TESTING FOR ACCURACY and ENDURANCE

Resiliency·Endurance·Accuracy

A REPLACEMENT SPRING, to be worth its price must combine three things: Resiliency, Endurance and Accuracy. And of these three Accuracy is the most essential.

A spring must "fit like a glove" if it is to be resilient and durable. It must "fit like a glove" if it is to give satisfactory service.

Your business as a repair man depends on your ability to give satisfaction to customers. Our business depends on your success and patronage.

Knowing this, we have built our business on one policy: Satisfaction to Car Owners—Satisfaction and Profit to Dealers.

The Harvey Process is but a part of the Harvey Policy. Harvey Springs are scientifically made from the best spring steel obtainable. They are so carefully made and so thoroughly tested in design, material and workmanship that Resiliency, Endurance and Accuracy are absolutely assured.

If you are not already selling the Harvey Springs you should get in touch with us at once. It means satisfaction to your customers and profit to you.

There's a Harvey Jobber near you. Drop us a card and we will send you his name and our Spring Book containing specifications etc. of over 900 kinds of springs. Write today, you may need Harvey Help tomorrow.

The "Y" and the WAR

When an officer said to Elsie Janis at the close of an entertainment in a Y.M.C.A. Hut: "You have kept my men from thinking of tomorrow's battle; they will fight better because of tonight," he expressed the big, underlying purpose of the Y.M.C.A. work. In other words, the

Y.M.C.A. is Helping Win the War

The Y.M.C.A. of wartime is vastly different from the Y.M.C.A. as most people know it. Its work has assumed tremendous proportions and achieved tremendous results. It is supplying a vital need—one that is not supplied in any other way. Its work is as important as that of any other organization which the war has developed.

Those of us who are bearing the lighter part of this great war burden must realize that it is not enough to raise and train an army. It is not enough to feed and clothe our men. It is not enough to care for those who are wounded. Soldiers are people, not machines. They must be kept mentally fit to make them efficient.

2,500,000 letters are written every day on "Y" Stationery

It has been demonstrated—is being demonstrated all the time—that the nation gives freely for the building of ships, for the manufacture of munitions, for the housing, clothing and feeding of our fighting men and for providing medical aid to those who are wounded. It will give just as freely when it understands that without the games, shows, stores, reading, educational courses and home comforts which the "Y" provides, all this other giving will be futile.

Consider yourself in relation to your own work. Suppose you were taken from your job, removed to another town and put to work. Suppose at the end of each day's work you ate your supper, went to bed, got up in the morning, had your breakfast went to work and kept this up for weeks and months—nowhere to go in your idle time; nothing to do; no friends who cared about you. How long could you keep it up? How long could you do your work? That would be the soldier's life without the "Y."

Somebody said, "beware of the army that sings." Armies do not sing in response to orders. They do not sing because of the joy of fighting. They sing because their spirits are high, because they are mentally, morally and physically fit; and it is this condition of mind and body, this building up and maintaining of the morale of our men, which is the deciding factor between a victorious and a defeated army.

Everything is free in the front line canteens

Four allied activities, all endorsed by the Government, are combined in the United War Work Campaign with the budgets distributed as follows: Y.M.C.A., $100,000,000; Y.W.C.A., $15,000,000; War Community Service, $15,000,000; American Library Association, $3,500,000.

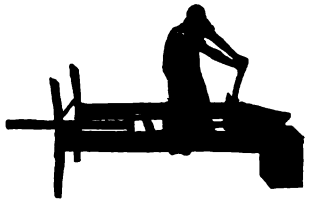
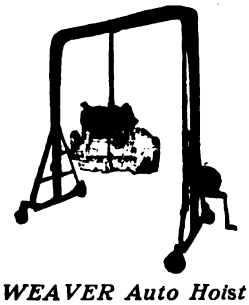
Mechanics Won't Quit the Shop that Uses WEAVER GARAGE EQUIPMENT



WEAVER GARAGE EQUIPMENT makes the mechanic's work so easy and pleasant that he will not leave a shop that is WEAVER equipped. WEAVER equipment takes all the heavy, tiresome part out of the workman's daily routine. He finds his work pleasant so he is satisfied to stay where he is.

WEAVER Garage Press Capacity 20 Tons



Let WEAVER Do the HEAVY WORK

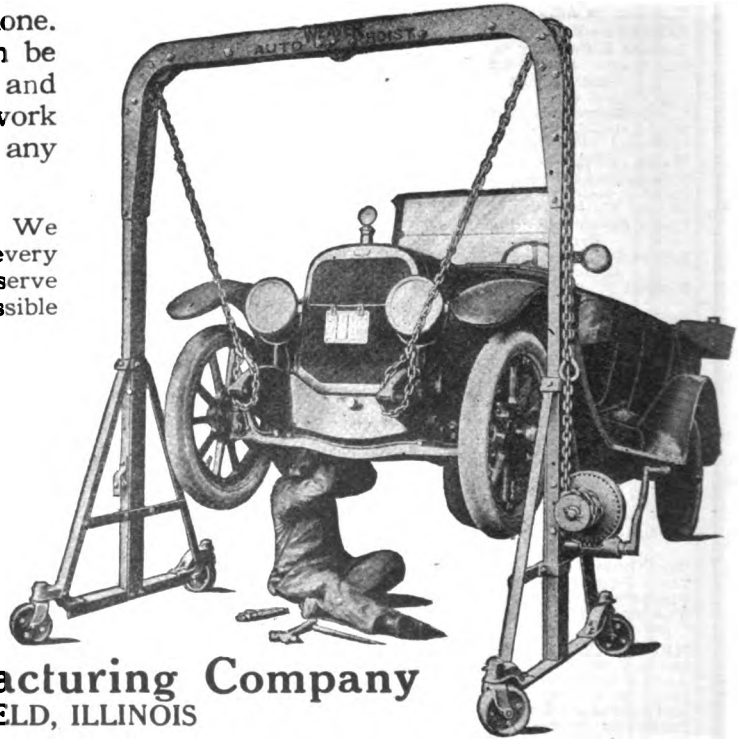
The garage owner soon finds that WEAVER Equipment is a big money saver for him. Decreased time on each job soon means greatly increased profits—and this is what WEAVER Equipment accomplishes in any garage.

WEAVER Garage Press in position for handling crankshaft.

Work done by WEAVER Equipment shows a decided improvement in quality. A job can be done EXACTLY as it should be done. Strictly high class work can be done only with proper tools and equipment—and high class work is a business builder for any garage

WEAVER Auto Hoist

The WEAVER line is complete. We are specialists in this business and every WEAVER product is designed to serve a distinct purpose in the best possible manner.



Drop us a line for a catalog illustrating and describing our complete line of WEAVER Garage Equipment.

WEAVER Auto Hoist

You will never know how efficiently your shop can be equipped until you have studied this line of products designed by experts.

HALLADAY

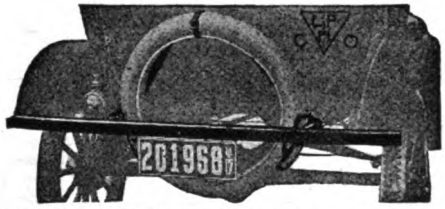
(The Mark of Quality)

BUMPERS
And Automobile Accessories

The New Under Frame Clamp Bumper

For All Extension Frame Cars

This is the last word in universal bumpers, fitting practically all cars of standard construction without cutting or drilling the frame or aprons.



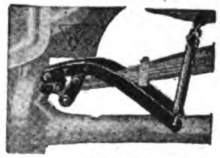
The Extension arm is bar steel combining light weight and greater strength.

Supplied with all HALLADAY bars in black Japan and nickel finish.

HALLADAY BUMPERS for FORD CARS

The HALLADAY Front Bumper for Ford Cars is the strongest and lightest on the market.

OUR NEW REAR FORD BUMPER



is supplied with or without the tire carrier.

It is secured to the car frame only, without cutting or altering.

The top support of the tire is an extension from the tire cradle and is in no way secured or attached to the car body.

HALLADAY FLEXLEVERS

The Most Efficient and Easily Attached Shock Absorber ever put on a Ford car.

The latest improvement includes **ALL STEEL CONSTRUCTION** double arms and springs, with hardened steel pins in malleable steel bearings.

Flexlevers are the only shock absorbers of this type that can be attached without removing the wheels or spring perches.

The HALLADAY Line

Also includes **Flexlevers** for heavy cars, **Double Arm Shock Absorbers, Tilting Steering Wheels, Can Tippers,** and other quick selling accessories.

Write for catalog and new price list in effect August 1st, 1918.

STAR LATHES

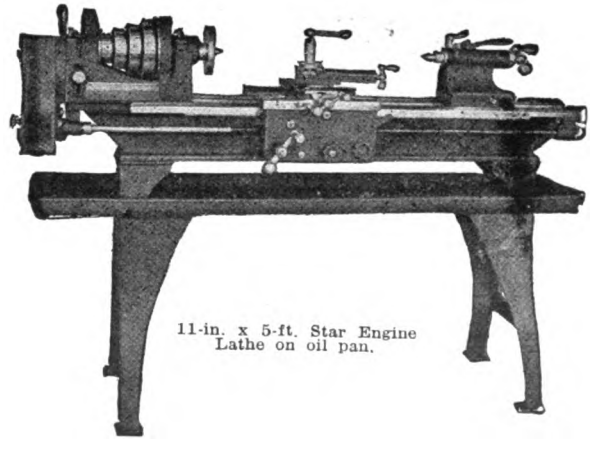
Remember the Second Factor

The amount of work you can do depends on **two** factors.

First, the number and caliber of the men you employ.

And second—and equally important — the equipment these men operate.

For instance, the combination of features found exclusively in Star Lathes means that you can use "small lathes" for a far greater variety of work—either light manufacturing or repair work.



By using Star Lathes with their high accuracy instead of larger, heavier lathes, perhaps thought necessary, you get all of these advantages—

(1) Saving in floor space.
(2) Saving in first cost.
(3) Greater production through simplicity of Star Lathe operation.
(4) Saving in power.

The Star Lathe catalog has details. You should have a copy. Write for it now.

The Seneca Falls Mfg. Co., Inc.

383 Fall Street, Seneca Falls, N. Y.

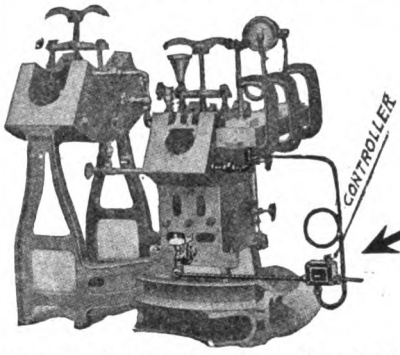
AUTOMATIC CONTROL OF STEAM PRESSURE

For All Gas-Burning Vulcanizing Machines



THE ALLIANCE CONTROLLER

All gas-burning Vulcanizers and Tube Plates should have Automatic Steam Pressure Controllers to insure proper and constant steam pressure.

The Alliance Controller automatically regulates the gas consumption and holds steam pressure at the desired point. It allows a full flow of gas to the burner to bring the steam up to the desired point quickly, and then automatically regulates the gas to the exact quantity needed to hold that pressure.

The Controller is easily adjusted and needs no further attention. Simply light your burner and forget it. Your steam will always stay at the pressure you want to carry.

Controller Installed on Akron-Williams Mold

The Controller can be easily and quickly attached to all makes of gas-burning Vulcanizing Equipment and Coil Steam Generators, and pays for itself through the saving in gas bills.

Complete Instructions with Each Controller. $7.50 Each

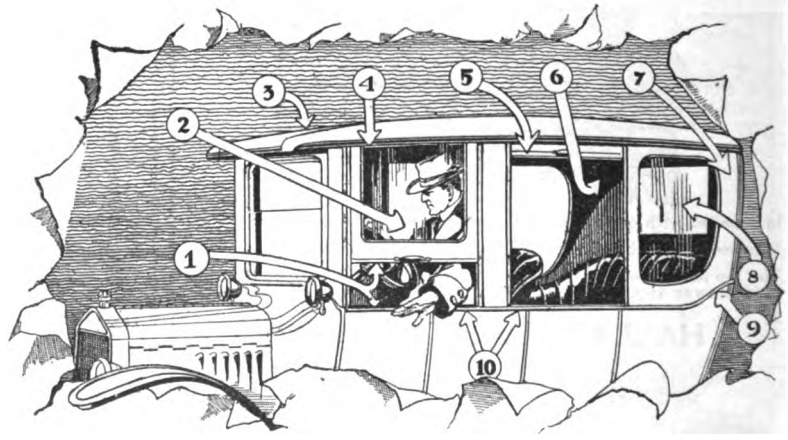
CREATES PROFITS

No equipment line is superior to the Detroit All-Season Weatherproof Tops as a money maker for Dealers.

They sell day in and day out, the year 'round. Right now the demand is abnormal. Seems as if every new and old car owner is in the market for a weatherproof all-season top.



DETROIT
DETACHABLE
WEATHERPROOF
TOP

If you are not already handling the Detroit Top line—you should secure the agency for your territory immediately. They are the tops your customers want, and profit returns are large. Write us today.

DETROIT WEATHERPROOF BODY CO.
Saginaw Street, Pontiac, Michigan, U. S. A.

SHARRER PATENT TOP COMPANY
Telephone, Circle 1636
2 doors West of Broadway, 239 West 56th St., N. Y. City

Wholesale and Retail Distributors in Eastern New York, Connecticut and Northern New Jersey for Detroit Weatherproof Tops.

Superiority Features

1 All four door windows instantly raise or lower any desired distance for traffic signaling, ventilation or weather protection.

2 Windows in doors made of patented, anti-breakable, non-rattling, flexible Pyrolene—clear as glass.

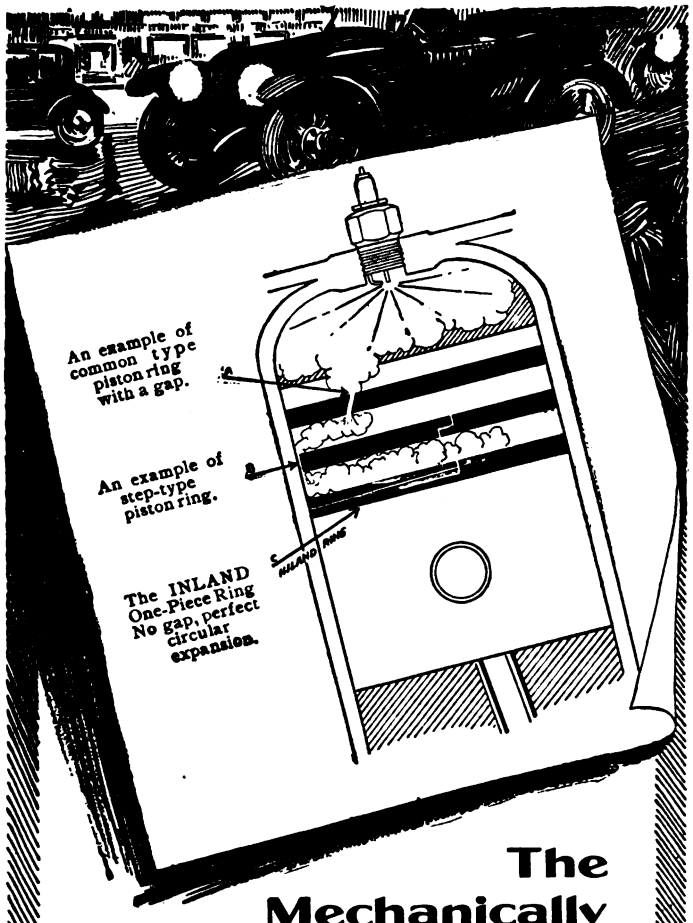
3 Lightest all-season convertible top made, but so strong and durable it will outlast any car. Only weighs 75 lbs. more than ordinary touring tops. Will not rack small cars.

4 Air space between outer weatherproof covering and interior limousine lining make Detroit Tops cool in Summer—warm in Winter.

5 Windows in doors do not roll or crumple, but slide straight up and down, housed absolutely flat on top

6 Completely lined and trimmed inside with special limousine cloth

7 Patented long wearing waterproof outer covering.



8 Glass where glass will not rattle.

9 Accurately fits on regular body irons and perfectly flush with top of body Does not mar deface or change car in any manner.

10 Extra wide upper doors afford easy entrance and exit under all conditions.

A Necessity—Not a Luxury. Makes a Wonderful Improvement in the Looks of Any Car

The Mechanically Perfect Piston Ring

Anyone who knows the purpose of a piston ring, can see at a glance that the INLAND Piston Ring accomplishes this purpose better than any other type of piston ring.

The ordinary piston ring (A) has a gap through which compression can escape, causing loss of power and waste of gasoline and lubricating oil.

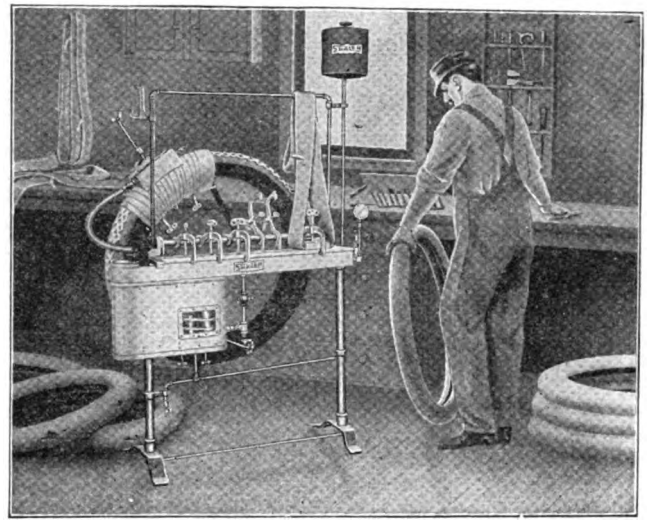
The step-type of ring (B) has no gap, but it fails to expand in a perfect circle and permits leakage along the cylinder wall where the pressure is uneven.

The INLAND Piston Ring (C) has *no gap* and its patented Spiral Cut causes it to uncoil in a perfect circle against the cylinder wall—making it absolutely proof against leakage.

That's why the INLAND Piston Ring has won the world's verdict as the *mechanically perfect* piston ring. That's why

3,000,000 INLAND Piston Rings are already in use.

Whether you are a manufacturer, dealer or user of combustion motors, investigate the INLAND Piston Ring.



INLAND 1 PIECE PISTON RING

Inland Machine Works

802 MOUND ST., ST. LOUIS, MO., U. S. A.

Jobbers everywhere have Inlands

Make Money Now Repairing Tires

The increasing cost, and limited supply of tires makes it necessary for motorists to conserve their casings and tubes—to get the maximum mileage. Present conditions offer tire repair men a big opportunity to make money—and help win the war. Experienced help is not necessary. A boy can learn how to make perfect tire repairs in 30 minutes. Every car owner in your town is a possible customer. Jobs are plentiful, because tires blow out and puncture every day. Motorists are willing to pay liberal prices for repairing punctures, blow-outs, cuts, tears, rim cracks, etc.

SHALER SHOP VULCANIZER

Is the Only One That Has

Automatic Heat Control

Will do as much and as perfect work as the large, expensive vulcanizing outfits which cost from $250 to $500. The price of this Complete Steam Vulcanizing Plant—heated with either gas or gasoline—is remarkably low—$70 subject to Trade Discounts. Outfit shown above is Type N. P. R.—No. 41—other models heated by steam or electricity are described in our catalog.

It is portable—easily moved to any part of the shop—occupies but little floor space—a boy can operate it easily, and make perfect repairs. The Shaler Patented System of Automatic Heat Control regulates it automatically. It must vulcanize just right. Can't overcure or undercure, and requires no watching or regulating. Large capacity. Repairs 12 casings and 200 tubes a day. Handles any style or size of tube or casing.

The Shaler Wrapped Tread Method of tire repairing is used by all tire manufacturers. It mends casings and tubes quicker, better and at less cost. We furnish Complete Instructions with each outfit. So simple that anyone can do perfect work.

Ask Your Jobber—or Write for Catalog

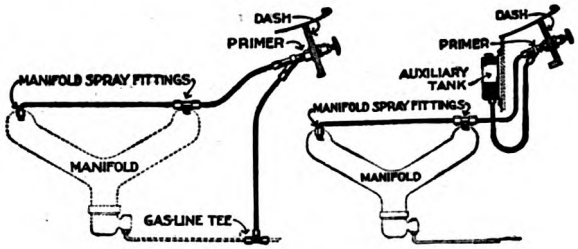
Sell This Auto Necessity—



NOT AN ACCESSORY—

Of Six Years' Proved Success!

Garage owners and automobile accessory dealers will do well to concentrate on a real necessity—one that every motorist, every driver of truck and tractor appreciates—the Imperial Primer. Sell it because for six years it has led in demand and in satisfactory service, all other so-called accessories. Sell it now because WE CAN DELIVER ALL ORDERS!

Imperial Primer prevents the usual winter-time drain on batteries and self-starters, and assures easy, instant starting in the coldest weather. It's a life saver for Ford owners. As an evidence of their worth, Imperial Primers are installed as standard equipment on a number of well-known makes of cars.

Imperial Primer

No. 55-D

Primer Outfit With Gas Line Tee. - $5.50

consists of Primer Pump, Gas Line Tee, Manifold Spray Fittings and Tubing. Readily installed on any make of car, including Fords. When ordering No. 55-D Outfits, always specify outside diameter of main gasoline line tubing.

No. 56-D

Primer Outfit $6.00

is similar to No. 55-D, except that it has an Auxiliary tank which holds 1½ pints of gasoline, instead of the Gas Line Tee. All connections made with the well-known Imperial Compression Couplings.

Dealers and Jobbers: Imperial Primers make easy, profitable sales. Write today for complete details.

Owners of automobiles, trucks and tractors, who are unable to purchase an Imperial Primer in your vicinity, write us and we will send a complete outfit, prepaid, upon receipt of price. Easily installed, complete instructions with each outfit.

IMPERIAL BRASS MANUFACTURING CO.,
520 S. RACINE AVE.. : : : CHICAGO.

D & B Carburetor

Price with Auxiliary Air Control **$10.00**

Puts POWER and PEP in a FORD Motor.

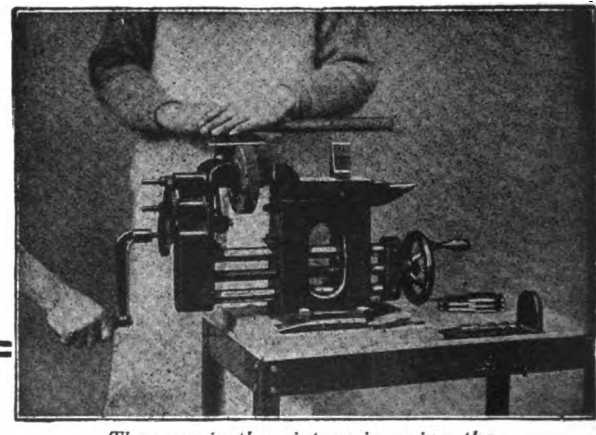
Put one on yours and watch it Get Away and Keep on Going.

Simple, Springless, Efficient and Economical.

Measures the gasoline and air with the accuracy of a chemist's scale, without depending upon springs or other weak construction.

The metal float insures a constant gasoline level, unattainable in any carburetor dependent upon cork or floats of similiar construction.

A profitable proposition for all live dealers.



Write us or our distributors for details and prices.

Have You Had Trouble With Your Tires?

The fault is not with the tires. You, or your chauffeur, or both, are to blame. The responsibility is yours because you should keep the tires pumped up to a specified pressure, and don't.

Tires that are kept up to the proper air pressure last twice as long—sometimes ten times longer—than tires that are run with not enough air in them. Measure your air daily with a

SCHRADER UNIVERSAL TIRE PRESSURE GAUGE

and get out of your tires all the miles they can give.

Mr. Ford-owner! Attention!

USE THIS→ AND PREVENT THIS

FOR - - - $6.50

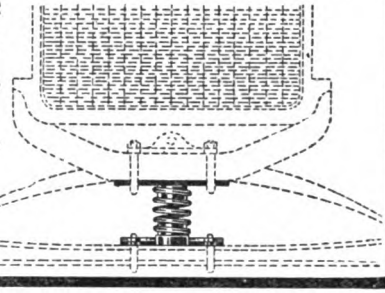
Can Be Installed in Less Than 20 Minutes by the Average Layman.

PLUNKETT SHOCK ABSORBERS

"A Shock Absorber and Rebound Snubber in One"

When the car is standing still, the shock absorber is in a normal position; therefore, when the car starts it takes the slightest action or greatest concussion. On the rebound motion of the car, as soon as shock absorber spring reaches its normal position, it starts to stretch or pull, thereby positively eliminating the extensive rebound which is so common on Ford cars. Can be installed without changing or altering any of the Ford parts or taking away any of the natural action of the Ford spring.

Price $6.50 each, complete



On receipt of check or money order, will ship prepaid to any part of the United States.

For Sale by all Progressive Dealers, Jobbers, Supply Stores and Garages.

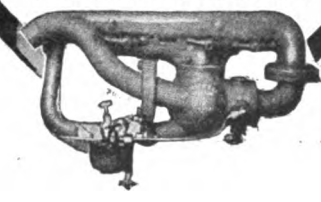
FORD OWNERS WHO ARE USING THE

Olsen Kerosene Vaporizer



are substituting kerosene for gasoline and getting equal power, more mileage and greater flexibility. The Olsen burns clear kerosene, saves 60 to 70% the cost of gasoline. Engine runs without skipping, stalling or loading up. No smoke, waste or odor. Fits any regular carburetor. No change in engine—no extras.

30-DAY MONEY BACK GUARANTEE

Write for particulars

We are prepared to offer a few dealers a very attractive proposition.

U. S. VAPORIZER COMPANY
213 State Street, Boston, Mass.

Made from Oil-Tempered Spring Steel Wire

They Remove Carbon Where Others Will Not

PATENTED MARCH 26, 1918

Cut out experimenting—get down to business. Why not own a set of FLEXIBLE CARBON SCRAPERS? They are the only scraper on the market that will do a satisfactory job without taking the motor to pieces. Compounds are dangerous. All good mechanics advise scraping carbon. Over 100,000 sets now in use by Auto Mechanics.

Price Per set, $1.50. Ask Your Dealer or Write

Flexible Carbon Scraper Co. 1421 W. Washington St. Los Angeles, California

Fewer Men Can Accomplish More With These Helps.

The more men the army needs and takes—the more mechanical equipment must you put in your battery shop to get out the work. Therefore, NOW is the time you must help your men with these time and labor saving devices. And they are money makers for the shop too.

Ambu Battery Steamer

Softens up the "compound" and enables the men to open the battery in the shortest time with no chance of damaging the box. Many a shop has lost the profits on several jobs by having to replace battery boxes broken in opening. Takes but a few minutes to open any battery. ***Each $25.00***

Ambu Battery Plate Press

Probably one of the most valuable "salvage" devices. By pressing plates properly the life of a battery is doubled and new installations avoided. Made of specially finished wood, acid-resisting. Saves its cost in the time lost in cleaning up the metal vise that has been corroded by acid and water. Produces perfect plates in a short time. ***Each, $32.50***

Ambu Plate Burning Rack

Burning-in new plates in a battery, without the use of a rack, is a long hard job. The AMBU Plate Burning Rack holds every plate in proper place till finished. Saves its cost on first three jobs. ***Each, $7.50***

Lead Molds

Save all the old lead in your shop. Melt it down into usable form in these handy lead moulds. Save their cost in salvaged metal in a few days. Every shop needs a pair and large shops several. ***Each, $1.80. Pair, $3.50***

"The Automobile Storage Battery"

A technical book in non-technical language that tells the theory and actual practice in the care and repair of storage batteries. Should be in the office of every shop for reference. ***Postpaid, $5.00***

Every device listed here has been tested and is in use in the leading shops of the country. We guarantee entire satisfaction or your money back without question.

If your jobber cannot supply you write direct.

HARTFORD :: :: CONNECTICUT

A Million Motorists Use It 4,000,000 More Need It

The limited supply and increasing cost of inner tubes makes it necessary for motorists to repair punctures, cuts, tears and cracks—to keep their tubes in good repair

War conditions make it imperative for motorists to stop the easy-going, wasteful habit of carrying $5 to $15 worth of spare tubes—that deteriorate quickly—and scrapping perfectly good inner tubes that merely have a puncture, cut or tear—which can be repaired *permanently* with a Shaler 5-Minute Vulcanizer, quicker than a new tube can be inserted.

Saves Tubes—Saves Repair Bills

You can repair your own tubes—as good as new. It's easy and inexpensive. *The Shaler works automatically*—and without fail. Just touch a match to the non-flaming chemical fuel. In five minutes you have a firm, flat, "feather-edge," permanent repair—stronger than any "stuck on patch"—stronger than the tube itself. No gasoline, cement or flame, and no danger of injuring the tube. Carry it in your tool box for emergency use It works in the wind, in any weather, anywhere The heat is applied directly to the pure gum patch and does not extend to the tube itself.

Complete Outfit Only $1.50

The outfit includes, the Vulcanizer—12 Patch & Heat Units (6 round for punctures, and 6 oblong for cuts)—complete, $1.50. Extra Patch & Heat Units 75 cents per dozen.

Sold By Accessory Dealers and Jobbers

TO DEALERS— To insure shipments—it is advisable to order from your jobber now The great demand has exceeded our factory capacity and shipment will be made according to priority in receipt of orders

Catalog of the Complete Shaler Line of Vulcanizers for Motorists, Repair Shops and Garages mailed on request.

"Red Devil" Chain Drills

Fast Sellers Good Profits

The demand for "Red Devil" Chain Drills is growing daily.

Some reasons why:

They have an automatic feed adjustable to any pressure. Friction is minimized by hardened tool-steel ball bearings and races. Polished steel chain. Heavily nickel-plated Universal chuck holds round or square shank drills and bits 3/16" to 3/8"; alligator jaws of forged tool-steel.

Unconditionally guaranteed against defects in workmanship and to give absolute satisfaction.

If you are not already selling them, write at once for our proposition.

Now and After the War

BATTERY CHARGING Will Pay You BIG PROFITS

CURTAILMENT of motor car production - more old cars in use—more batteries to charge—and battery charging means bigger business and bigger profits—that's the opportunity you have right now. After the war, the demand will be vastly increased and your opportunities will be greater than ever.

HB 500 Watt Battery Charger

Go after this profitable business now and build for after the war with HB equipment. Anyone can operate—no extra help necessary. This 500 Watt Charger will recharge from 1 to 7 batteries at once, with a current cost of only 12c to 15c per battery. Autoist pays 75c to $1.50. Hundreds of HB owners are clearing $100 to $150—some even more. Why not **you**?

$15 Puts This Money-Maker in Your Garage

Balance in 9 monthly payments of $20 each. Earnings should easily pay and make good profit besides. Write for full particulars or send $15 with trial order and get your charger at once. Under absolute money-back guarantee, you run no risk. Write or wire today.

"Classic" Curtain Lights—*Improved*

All screws banished.

Frames of very unique construction—simply snap together.

This grips the curtain material evenly and securely, making it impossible to sag and wrinkle.

It also makes a water-tight job.

A cutting pattern is furnished with each light, so that all trouble for trimmers is removed.

CLASSIC CURTAIN LIGHTS are shipped with glass permanently secured in the outside frame, thus eliminating all glass breakage in setting.

Standard "CLASSIC" finish is American nickel silver.

We are prepared to make prompt deliveries.

We make these lights in three sizes only, namely:

No. 1—C, 7-9/16 in. x 12-1/2 in. oval
No. 2—C, 5-3/4 in. x 9-1/2 in. oval
No. 3—C, 6 in. round

Let Us Put You Into the Business Of Building MOTOR TRUCKS

YOU don't have to close up shop or run along barely paying expenses—you can build motor trucks at a good profit if you will annex yourself to the Lauton Plan and sell the Lauton Truck Unit in the right way. Make your average sale $1,000 to $1,500 and earn a profit on the entire truck—not merely on the truck unit.

Big Profits Quick

The business world is clamoring for trucks, willing to pay a premium for immediate delivery. This is your opportunity to do a real service and be well paid for it. With the Lauton Truck Unit you have the "better half" of a truck. It's a real truck builder. Chasses, bodies, painting you can easily supply. You can build up a business in trailers also.

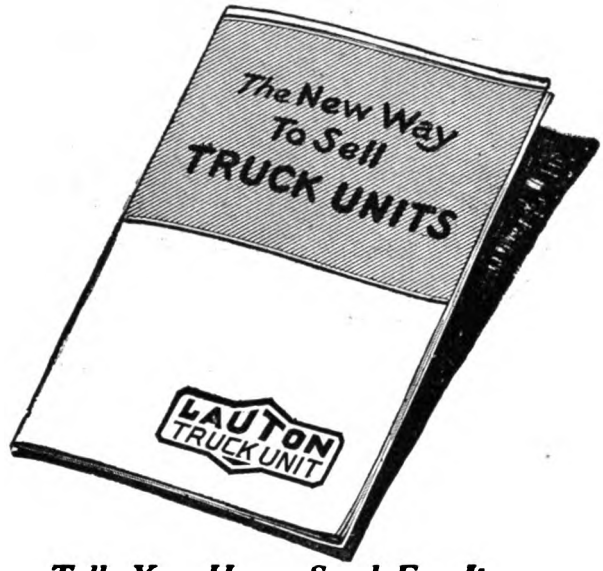
Easy to Finance

The Lauton Plan for selling truck units, or rather for getting into the truck building business, can be financed by any live, energetic dealer. We have worked out a plan to help you—it is a real plan. But of course the details are only available to signed-up Lauton dealers.

Carnegie-ize Your Business

The Lauton Plan gives you several profits in place of one. Instead of selling part of a truck at part of a profit, you sell a whole truck at a complete, adequate, satisfactory profit. This was the Carnegie idea—and it is the idea in which all big business is now working.

Hundreds Are Doing It



The Lauton Plan is time tested. Hundreds of dealers are operating under it. They are enthusiastic. Men always are enthusiastic when they make money.

The book, "The New Way to Sell Truck Units," will give you the proof—over the signatures of men you know—that the Lauton Plan pays handsomely. Don't be a skeptic. Write today. This plan will be worth thousands of dollars to you if you are able to control it for your territory. But you must *act* to do this.

NON-BURN ASBESTOS BRAKE LINING

THE one biggest thing in a brake lining is its Asbestos. And to go a step further a brake lining's dependability is all a matter of asbestos fibre. For, like wool or cotton, fabric woven from asbestos depends for strength and long wear on the length and strength of individual fibres—and on the skill in their conditioning and weaving.

True, you can't measure or test fibre yourself. But in NON-BURN it's done for you. A half century's experience has taught us to set apart, from our big annual tonnage, just the fibre that efficient brake lining service demands. That same experience backs up its fabrication. When you're handling NON-BURN, you're selling a safe, strong, tough lining made at Asbestos Headquarters—by Johns-Manville.

* * *

Under the Johns-Manville sales policy, NON-BURN is sold only through jobber-dealer channels. Ask for details.

Here is a Lathe that does far more

You should know its full possibilities on your work

Star Lathes *are* "small lathes," but they are built with an accuracy and rigidity that enables you to do work with the Star Lathe that formerly had to be put on heavier, more expensive machines.

STAR LATHES

9-in. x 4-ft. STAR Engine Lathe

In combination with their long established accuracy, Star Lathes offer extreme simplicity of operation. This is a big factor towards speeding up repair work.

Write for a free copy of the Star Lathe catalog with details. Investigate freely the possibilities of saving floor space, first cost and power.

Star Lathes are made in 9-in., 11-in. and 13-in. swing sizes. A full line of attachments can be furnished.

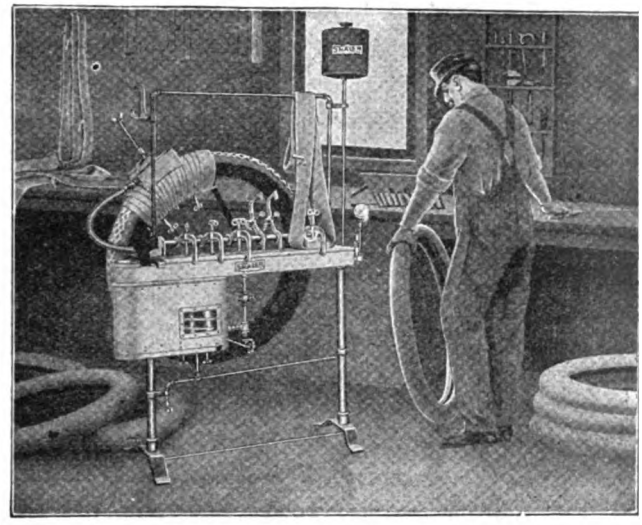
"NORMA"

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

The ultimate measure of a car or truck is in the strength of its weakest—not its strongest feature. Appearance may deceive, but performance will surely reveal the integrity—or otherwise—of the design, construction and equipment. Let your scrutiny of service qualities extend to every detail of every accessory.

There is a distinguishing mark by which magnetos and lighting generators which deserve your unqualified confidence may be identified. That is the presence of "NORMA" Ball Bearings—the standard bearings adopted by apparatus builders to maintain the high quality of their own product.



Be Sure—See that Your Electrical Apparatus Is "NORMA" Equipped

THE NORMA COMPANY OF AMERICA

Ball, Roller, Thrust and Combination Bearings.

"NORMA"

Make Money Now Repairing Tires

The increasing cost, and limited supply of tires makes it necessary for motorists to conserve their casings and tubes—to get the maximum mileage Present conditions offer tire repair men a big opportunity to make money—and help win the war Experienced help is not necessary. A boy can learn how to make perfect tire repairs in 30 minutes. Every car owner in your town is a possible customer. Jobs are plentiful because tires blow out and puncture every day. Motorists are willing to pay liberal prices for repairing punctures, blow-outs, cuts, tears, rim cracks, etc.

SHALER

SHOP VULCANIZER

Is the Only One That Has

Automatic Heat Control

Will do as much and as perfect work as the large, expensive vulcanizing outfits which cost from $250 to $500. The price of this Complete Steam Vulcanizing Plant—heated with either gas or gasoline—is remarkably low—$70 subject to Trade Discounts. Outfit shown above is Type N. P. R.—No. 41—other models heated by steam or electricity are described in our catalog.

It is portable—easily moved to any part of the shop—occupies but little floor space—a boy can operate it easily, and make perfect repairs The Shaler Patented System of Automatic Heat Control regulates it automatically. It must vulcanize just right. Can't overcure or undercure, and requires no watching or regulating Large capacity. Repairs 12 casings and 200 tubes a day. Handles any style or size of tube or casing.

The Shaler Wrapped Tread Method of tire repairing is used by all tire manufacturers. It mends casings and tubes quicker, better and at less cost. We furnish Complete Instructions with each outfit. So simple that anyone can do perfect work.

Ask Your Jobber—or Write for Catalog

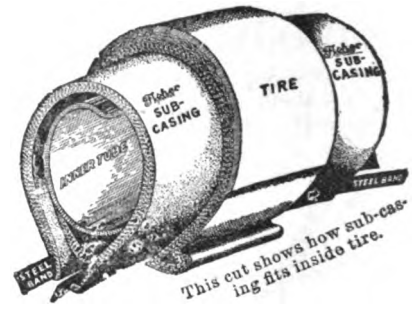
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE

LESS TIRES TO BUY

The Blows That Your Tires Receive, When You Strike Objects in the Road, Leave Weakened Places in the Fabric

A TIRE IS AS STRONG AS ITS WEAKEST POINT



The weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings.

Write for Particulars

FISHER MANUFACTURING CO.

1706 Payne Avenue **Cleveland, Ohio**

This cut shows how sub-casing fits inside tire.

20th CENTURY'S No. 6 SELF-VULCANIZING PATCH

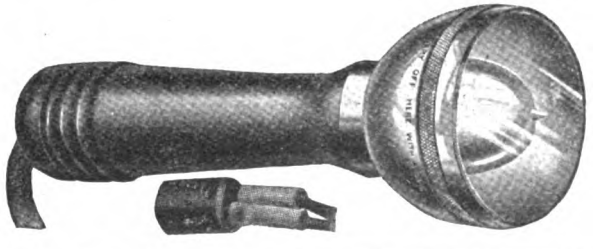
A FRIEND IN NEED

Everybody Needs a Trouble Light

It is as much a part of a car's tool equipment as a pair of pliers or a wrench.

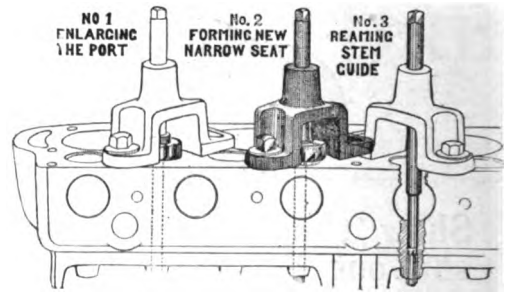
Let engine trouble, tire trouble or any unforeseen mishap occur while driving at night, and a good Trouble Lamp is a real friend in need.



The Connecticut R W Trouble Lamp illustrated above is made up in a neat, substantial manner with a solid brass reflector, heavily nickeled and highly polished. A wire guard, so arranged that it can be collapsed for the removal or insertion of a lamp, protects the bulb against accident.

This lamp is fitted with a rubberoid handle and ten feet of black rubber covered Duplex cord, complete with attachment for plugging into lamp socket on dash.

The Connecticut R G Trouble Lamp is similar to the R W except that the bulb is protected by a high grade lens, which makes it, without doubt, the finest trouble lamp on the market.



Both the R W and R G Trouble lamps are made with plugs for one or two wire sockets and each is packed in a tubular case with screw cover—the R W without the bulb—the R G with a six-volt, 4 C. P. light.

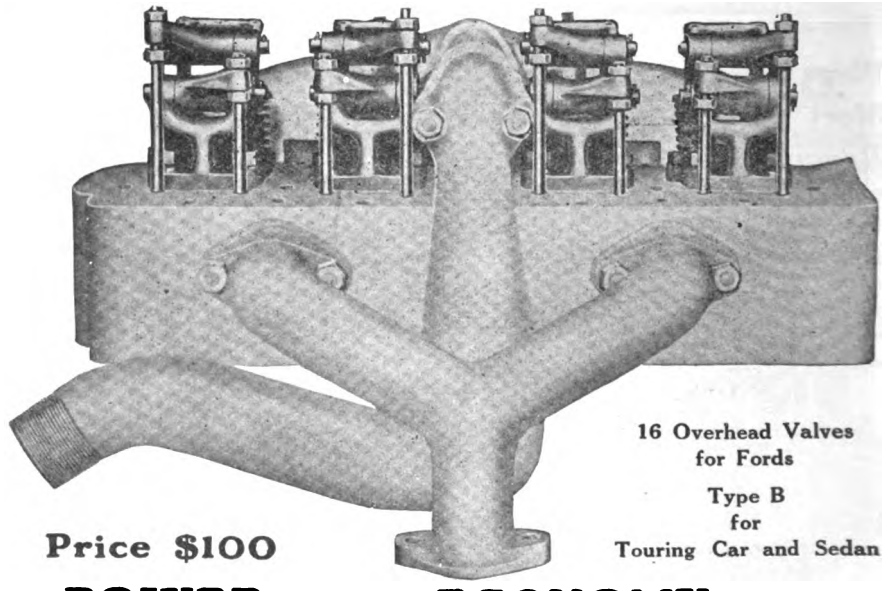
A Most Valuable Tool

Just what you have been looking for! Makes accurate fitting bearings and insures perfect alignment With it, your cheapest man can do expert bearing work. It will pay big in time and trouble saved.



Storm Piston Vise

For greater speed and convenience on Ford piston work. Holds the pistons firmly while repairing or replacing bushings, pins, rings and rods Saves time and prevents damage.

Make Your Ford a $3,000 Car from the Standpoint of Motor Service.

Intake side type B, the latest Roof 16 valve design for Ford touring cars. Exhaust and manifold operate on same side. Note how intake is heated by exhaust manifold, both manifolds being in contact with each other at the division point on the intake, giving all the advantage of hot spot manifolds. Note the simplicity of the design, how easy it can be installed, and that threaded end of exhaust manifold can be connected with regular Ford exhaust pipe.

16 Overhead Valves for Fords

Type B for Touring Car and Sedan

Price $100

SPEED POWER ECONOMY

Speed to climb the steepest hills as you never dreamed of before. Power to double the value of your converted Ford truck, the load carrying capacity of which is only limited to the strength of the rear axle. Speed for the road or for the track to rival the high cost racing cars. A long list of racing car drivers, winners of speed contests, show what you can look for if you want a snappy speedster or a race track winner. Special equipment for touring car, truck and racing car for $100.00. Extra racing equipment at special low prices. Get our quotations on high speed cam shaft, gray iron pistons, aluminite connecting rods, Lynite pistons and rings complete, counter-balances for crank shaft, nickel steel racing gears 3 to 1 ratio, special oiling systems, fast carburetors and beautifully designed racing bodies. Every Ford owner a likely prospect and every Ford converted truck owner a sure sale. An absolute necessity to every owner of a fast Ford.

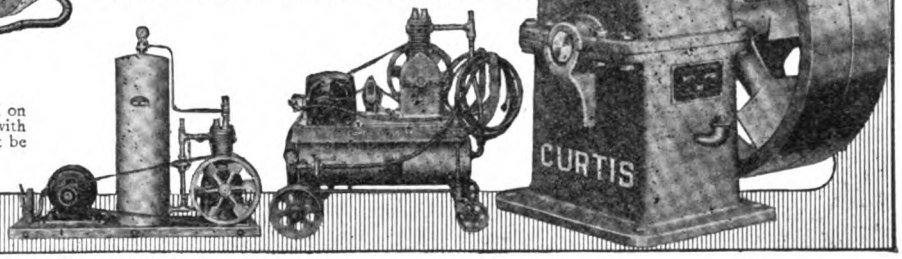
Install a Curtis Air Compressor



Display a CURTIS "FREE AIR" SIGN above your door—it inspires confidence and will help build your business. Motorists are looking for this familiar CURTIS slogan—because they know oil rots tires—and that a CURTIS Air Compressor furnishes AIR FREE FROM OIL, which means fewer blowouts, greater tire mileage and less repairs. The CURTIS is the ONLY Garage Air Compressor with the controlled splash oiling system that eliminates all danger of forcing oil into the air line.

CURTIS AIR
FREE FROM OIL

Investigate the many exclusive features of CURTIS Garage Air Compressors. The line is complete—five sizes—stationary or portable. Just write your name and address on the margin of this advertisement—tear it out and send it to your jobber, or to us direct, for complete information and prices.

Curtis Pneumatic Machinery Co.
1530 Kienlen Ave., St. Louis, Mo.
Branch Office—530-E Hudson Terminal, New York City

The Curtis Sign

Illustrated above—is 10x14 inches—baked enamel on steel. Cannot be bought, but is furnished FREE with every CURTIS Garage Air Compressor—and cannot be had in any other way.

PERFECT POWER FROM EACH PISTON

A ONE-PIECE PISTON RING

GILL PISTON RINGS are self fitting, ONE-Piece rings of sturdy construction. They have a distinctive joint which absolutely prevents the escape of compression, the formation of excessive carbon, or the pumping of oil into the combustion chamber.

ASK YOUR DEALER for GILL PISTON RINGS, or write us today.

HOW THEY'RE MADE

"NO-LEAK-O" "oil SEAL ing" rings are made from a special formula of close-grained, tough gray iron, a few points softer than proper cylinder metal. Individually cast, retaining on the inside the skin of the casting, which insures long life and lasting resiliency. Finished to the utmost practical limits of accuracy, on special machine tools. Made under patented processes, by which even tension on the cylinder wall is secured, superior to any other process of manufacture.

The finished ring has equal bearing on the cylinder wall—the ring wears evenly. The cylinder wall wears evenly, and not oblong, which is the result with the use of most all one-piece rings.

"NO-LEAK-O" rings are not ground, but turned, leaving the tool marks. They will fit themselves quickly.

Mr. Repairman, Listen! This is Your Harvest. Don't Neglect It.

There are over 4,000,000 automobiles in the United States, say nothing of commercial trucks, tractors, etc. Old cars are being rebuilt. *War or no war* they must be kept running. "No-Leak-O" "oil SEAL ing" Piston Rings are *unlike any other ring* on the market. Simple, *one piece*, tough and springy, easy to install, not liable to break, and popular in price. *Send a trial order at once.*

Model 280

GARAGE

Testing Instrument

This is the most practical Electrical Equipment you can install. It enables you to locate electrical troubles in motor cars and apply the proper treatment to remedy them.

This Weston Instrument is considered indispensable by thousands of garage owners who use it. A very large demand has resulted. No competitive make of instrument is nearly so comprehensive in scope or dependable in operation.

In normal times, we can promptly fill orders; but under present circumstances, when government demands are exceedingly heavy and our raw materials can be used only for government work, garages should either furnish us with government contract numbers, when available, or place their orders subject to preferential delivery when it is possible for us to manufacture and make shipment of commercial orders.

Big Business—Splendid Profits

Zwebell Retreader and Tire Rebuilding Machine

Auto Owners and Dealers—Send us a tire with good fabric and Bead

We will retread and return for your approval.

PATENT PENDING

Never in the history of the tire business has the demand for rebuilt tires been so great as it is in this day of eliminating waste. You don't have to create the field—the field for your action is already created—it is a tremendous one and only waiting for more men. There will be no long drawn-out delay—you can go at it right now. We will post you on every point in rebuilding tires in sections and complete. This outfit pays for itself in so short a time, that it's surprising that anyone should hold back at all. It is a permanent business that will grow along with you as long as you live and then some. The Zwebell Retreader Has the Widest Range of Usefulness of Any Tire Machine on This Earth—It Has No Equal. Big designing engineers say so, and you want the best or none at all. Did you ever see a tire repairman who didn't have *more* than he could attend to? What are *you* doing—looking at the other fellows getting all the money and you just folding your hands? We will put you in "the swim" quick but you must write us a letter today—and don't fail to do it. We will explain everything—nothing will be left untold. This is the logical business for the Automobile Dealer, Garageman, Filling Station, to go into during this time—Conserve. Send for sample section of work done on this machine.

Zwebell Brothers Co., Mfrs., 486 Milwaukee St., Milwaukee, Wis.

At Our Risk-You Can Prove it.

DON'T waste good money on tire pumps that either break your back, or pump *Rubber Rotting* oil particles or gasoline fumes into your tires.

TAKE NO CHANCES

At our risk you can prove that the "DEAD EASY" is quicker, safer, easier and cheaper than any other tire pump, either engine drive or hand power. Convenient to carry with any car, it is always ready for instant service. The gauge showing exact tire pressure, there is no guess-work—and it's "DEAD EASY."

The Wise Family's Christmas

IS A month before Christmas, and the family of Wises are looking for gifts and other surprises.

They can take home for Mother, for Paw and the Kiddies, that will help Uncle Sam, and save dough for the middies.

Camouflaged ribbons, or toys that won't run, are all right in Peace, but we're fighting the Hun.

From the oldest Wise man, to the youngest wee mite, the whole family's looking for gifts that are right.

Things that are useful, conservative, fitting, that won't interfere with Aunt Sammy's knitting.

Far be it from me to break any traditions of Christmas even in a mechanical magazine—I have started this story with a jingle, used an initial letter showing our old friend Santa Claus, and sprinkled in a few holly leaves—thus indorsing my story with the Christmas stamp. Therefore I trust that the more conservative readers will look upon it as a real Christmas article.

The family of Wises are old New England folks, doubtless a few of the readers are well acquainted with them, but I won't tell their real name, for Mr. Wise is too well known in Rhode Island and is a reticent sort of a man who dislikes to see his name in print.

Like all business men, Mr. Wise had ignored (or forgot) the fact that Christmas was fast approaching, and 'twas at the breakfast table one morning that his faithful wife broached the subject.

"Well, father," said she, "what shall we give for Christmas this year? We don't want to wait till the last minute, as we did last year, and have to take anything we can find and give things that no one wants. Goodness knows it's hard enough to think up things without straining our pocketbooks too far.

"I have to buy four presents for you, three from the children and one from myself; then I have to turn around and buy a present for each of the kids for you to give them and a like number for me to give them—and by that time my poor brain is in a whirl. Can't you make just a few suggestions?"

"Oh, get them anything you want to," said Father Wise, who was ingrossed in his morning's paper; don't bother me—besides it's too early now, anyway."

"That's just what you did last year, left it all for me" (suspicion of tears). "I'll tell you one thing, Mrs. Wise, said father, "if you want a real, live war on your hands

Digitized by Google

tell everyone to hand me out a necktie. That's what they did last year. Fourteen ties! Maybe I can be enthusiastic about one orange and blue tie with big splotches of black on it; possibly I can give a sickly smile when I open a second bundle and find a striped blue and black creation—but I'll draw the line at two—nothing doing when it comes to fourteen; I won't enthuse over them—that's final."

Having delivered himself to this ultimatum, Father Wise put on his hat and hustled to catch the train for the city, leaving his poor wife to plan her Christmas campaign.

Above all things, Mr. Wise is no slacker, and on the way to his office he thought over the proposition and during the day he revolved it in his mind, but did not reach anything like a solution until two days later.

Just two noons later—for he always walked twice around the block after lunch—he found the answer to the problem, and when he reached his home that evening he broke the news to mother that as far as he was concerned he'd settled the Christmas business once and for

What in the Dickens Can I Do with Fourteen Ties?

all, and that she need not buy anything for him to give anyone—he'd do that himself.

Let's throw in our reverse for a minute and back up for a week or so. Just around the corner from Mr. Wise's office there was an energetic accessory salesroom man who always made a point of being just one step ahead of his competitors. He had decided that there would be an especially big chance for the sale of automobile sundries and supplies for Christmas gifts and worked his brains overtime.

While the Wises were holding the little family "spat" at the breakfast table the bright salesman had been busy before breakfast trimming his window with Christmas gifts—the first Christmas display, by the way, in the city. The department stores always blossomed forth with elaborate displays—there was always a crowd of people around the windows of the toy shops—and even the fish market around the corner showed a Christmas spirit by making a special offer of three goldfish in a glass bowl for a half dollar.

If the fish market could make something out of Christmas, surely an automobile accessory store could do the same thing. It might take time and require lots of thought, but it would be worth while; so, as I said before, he spent one morning trimming up his window with Christmas gifts.

That he was successful was shown by the steady stream of customers who caught the idea from his window. He had placed a big fir tree in the middle of the window and upon the boughs had hung little packages, wrapped in holly and tissue paper. To each package he had affixed a price tag and had so arranged the tags that at the top of the tree there were a number for 25 cents, tire patches, gasoline gauges, and other cheap things; the higher priced articles were placed lower down and around the bottom of the tree he grouped lunch kits, camp chairs and tires.

At the front of the window he had a number of Christmas cards arranged in line, each one bearing one of the following combinations of words, all making the jingle: For Father—For Mother—and the Kids—For Auntie—For Uncle—and for His Nibs. Back of each card he placed a suitable gift that would be appreciated by that member of the family for whom it was intended.

It was this show window that attracted Mr. Wise on his first trip around the block on November first. I should have stated that Mr. Wise owned a family car, of which he was extremely proud. He spent 30 hours a week tinkering upon it, washing it, mending the tires and polishing the brass, and spent with his family three hours a week in it. It didn't always purr like a contented kitten and it didn't always go up the grades on high—but he was proud of it just the same.

The show window gave him the idea and he made several visits to the salesroom in the next few days until, as I have said, he had purchased all the gifts for his family.

That night at home, while he was pouring over an old automobiling instruction book which he had unearthed from in back of his gasoline tank, he remarked (casually, of course), "Saw a cracker-jack spotlight for only $5.00 round the corner from my office today; wish I could afford to buy it, but with Christmas coming on, guess I'll have to wait—'twould look pretty nice on the windshield of the old bus, make her look like a 1919 car."

Mrs. Wise took no chances that the light would be sold, and as soon as she finished the dishes in the morning she took a little trip to the city, returning with the spotlight for father, as well as the BIG IDEA.

An Automobile Christmas—something new; nothing useless and no duplicates. No one had ever thought of an Automobile Christmas, that's just why it would be so interesting.

And why wouldn't it be practical? Father was wrapped up in his old machine—the oldest boy "chauffed" for the family when father wasn't around; the younger members of the family always looked forward to the Sunday trip, and everyone had the greatest interest in father's car. If everyone received something they could

Digitized by Google

use in the car, or on it, then the car would literally be "a family car" and belong to them just as much as the home.

Then again, "Uncle" owned a car and undoubtedly he would like gifts he could use on it just as much as father. Surely it would be fun to pick out automobile accessories as gifts, and that's just what mother did—

No More Frozen Feet for Aunt.

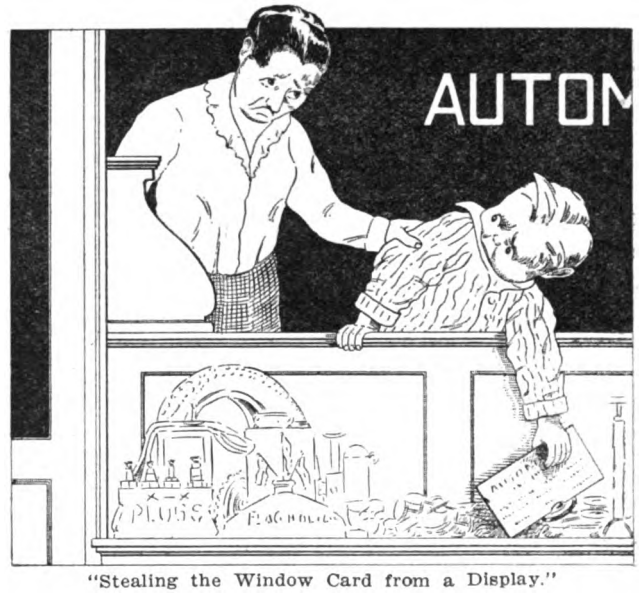
it's just what father did—and even the children caught the idea. The first time mother took little Harry into the accessory store the saleslady caught him trying to run off with one of the price tags from the show window.

Let's put our gears into high now and run the car along for a few weeks until we come to the day before Christmas. Mr. Wise worked in an office of a firm that had handled a number of large contracts, and consequently the "Boss" felt fairly happy, having shown a big profit for the year. Ordinarily he gave each employee a $10 gold piece. Mr. Wise usually received this same amount and had come to look for it at Christmas time.

He was due to a disappointment, however; he did not receive a small, heavy envelope, but a long, thin one. When he opened it he found a folded pasteboard, which proved to be a W. S. S. book with one stamp in it. Pinned to one corner was a little note, upon which was written the words, "Don't be a crank, it interferes with your good work."

Above all things, Mr. Wise was NOT a crank—he was the best natured man in the office, so he felt rather hurt until the "boss" came out to look over his shoulder and slap him on the back. Then he unfolded the note and this is what he found: an order on a nearby garage for a complete starting motor equipment which could be applied to his car. Boss said he never would take a chance on a Flivver unless it was fitted with a starting motor—it made him cranky, and he s'posed it would have the same effect on Wise.

Mr. Wise reached home that night a battered wreck, happy nevertheless. On the train his hat had been punched through with the handle of a toy carpet sweeper; a sticky youngster had clung to his coat tail with an equally sticky hand, which had left an everlasting imprint; but he had found a neighbor who owned a car just like his own and was having the same trouble with gas—therefore he was happy.



His pockets bulged with small bundles, his arms were full of mysterious packages, all of which he dumped beneath the tree in the front room; taking a second or so to inspect a particularly lumpy and mysterious bundle marked with his own name. "'Taint the spotlight," he whispered to himself; "wonder if mother took the hint?"

He didn't have much chance to worry about the spotlight that night, for he had all of the children's stockings to fill, nuts to crack, and much trimming to do, for mother had invited a liberal assortment of aunts and uncles, nieces and cousins to dinner and the tree the next day. It took him nearly an hour to persuade one of the children that Santa wouldn't get stuck in the chimney, and to put him to sleep.

Since this isn't strictly an ordinary Christmas story, I won't bother to tell about what the children had in their stockings, the real presents were hung on the tree and put around it. Father usually presided and handed out the presents and tried to make as many jokes as possible.

They say that woman's curiosity is a dominant feature of her make-up; it's lucky they don't know about men—father made a "bee-line" for that mysterious package which presented such a lumpy appearance. It looked like a combination of a fresh Virginia ham and a mandolin, with two warts on the side of it, and on the outside was written, "Save the drops and the gallons will take care of themselves."

"Looks like a new engine," said father, divesting it of its wrappings. It proved to be a combination intake and

"Stealing the Window Card from a Display."

exhaust manifold for the Flivver, from his brother, and father's smile was so broad that it endangered the back of his neck. "Been wanting one of those manifolds for some time," said father, "but just haven't found the time to have one installed. The old engine has been consuming lots of fuel lately, but guess this will fix it."

"Just to show you my heart's in the right place, here's

Digitized by Google

something for you—says on it, 'Time is money; here's riches'; hope you'll like it as well as I do the manifold."

Uncle's present proved to be an eight-day automobile clock with an illuminated dial that could be seen in the dark. Uncle was pleased, for he knew how nice it would look on the dash of his Hudson car.

Gifts and presents followed for the children, for mother and the nieces, and it was a noisy time—the youngest boy made life hazardous for the rest of the people by recklessly operating a miniature automobile around the floor; said machine being fitted with a raucous horn, a windshield that could be tipped (and was) at any angle, lights that would light (for a short time) and a crank that would "wind" up the engine.

"For an inquisitive amateur repair man," said father as he handed out a small, round package to one of his nephews. A "wow" of joy from the recipient proved that the gift was welcome; a small trouble lamp that

"My Car May Be a Flivver, but Even That Has Four Wheels."

would wind into the dash upon a small reel. "Just what I want myself," said father, "so I judged you would be rather pleased."

"So you can look into the future," proclaimed the next tag—"from mother to father." "That's it—that's it," shouted the delighted pa as he removed the wrappings. "My, what a beauty, a spotlight; and I'll be durned if it isn't a trouble light, too. Cord winds inside on a reel—good-bye, folks, I'm off to the garage."

But they wouldn't let him go until all the presents had been given out. "A start in business, for sonny," proved to be a wonderful combination—vise, drill, lathe, and, in fact, what amounted to an entire machine shop. This present for his oldest son from father was made with a purpose. Son was to overhaul father's car during the winter, and father intended that the job should be done right.

Later on the son received an electric engine heater (he was usually called upon to do the cranking on cold mornings) and rejoiced knowing that he could start the engine without cranking his head off. "To help you up in the world" proved to be a handy automobile jack, and "For a gentleman mechanic who likes to keep clean" was a half dozen cakes of special hand soap.

Father kept mother waiting some time for her big present, which was lettered "As warm as my heart." A fine, big automobile coat that had nice warm pockets and a high collar. Mother voted for a ride in the machine that day, just to try the coat.

"A special place for the youngest," was the inscription on a bulky package for the smallest Wise boy. It proved to be a collapsible auto seat, made of leather and with a nice low back. It would just fit in the tonneau of the Flivver, and the youngster, who always sat on the floor, gave a sigh of satisfaction.

"Don't have cold feet." This was written on a big square bundle for mother-in-law. She always complained about the cold floor of the tonneau in her car. It spoiled her winter trips, and though it was a closed machine she seldom rode in it for that reason. The present proved to be a small heater, which could be attached to the exhaust pipe and would give a comfortable warmth, even to the tonneau of the machine itself.

"Little drops of water make the windshield foul,
Make the careful chauffeur grit his teeth and scowl,"

was the inscription on a bundle for father which contained a wildshield wiper. Father also drew a package which contained one shock absorber and the caption, "Smoothing out the bumps from the road to happiness."

"Even if my car is a flivver it has four wheels," said father. "One shock absorber is 25% welcome—thanks one-quarter's worth. The other three shock absorbers were found in due course. The whole set of four cost too much for one person to give him, so four people clubbed together and each gave him one.

"A good friend who will stick to you," proved to be a box of tire patches from the youngest, bought with money he had earned picking strawberries.

One of the aunts was made happy by receiving a thermos bottle and the other aunt received a heavy automobile robe in which there were pockets for the hands.

"So that you can find yourself," inscribed on a package for uncle, proved to be a route book of New England. (Uncle had managed to get lost in the wilds of Vermont twice the preceding autumn on a hunting trip.)

As the younger member of the family opened a peculiar looking bundle, the air was rent by a terrific squawk and the youngest produced an automobile horn of diminutive size for use on his bob-sled. A little later he received a flashlight and thereafter he paraded the house, a lifelike and noisome imitation of an automobile, alternately blowing the horn and flashing the light.

With joy in his eyes father reached for the last bundle—high on the tip of the tree. It was for him and inscribed with the enlightening question: "What is home without another." The package contained three neckties, but the donor's name was missing.

The Retail Store Window a Gold Mine

An Attractive Show Window Display at Christmas Time Is of Paramount Importance To Every Merchant; It Acts as a Silent Salesman

BY FRANKLIN MYERS

ANY store publicity campaign, if developed along broad lines and concentrated in support of a consistent, well-balanced and thorough-going program, is bound to be a success.

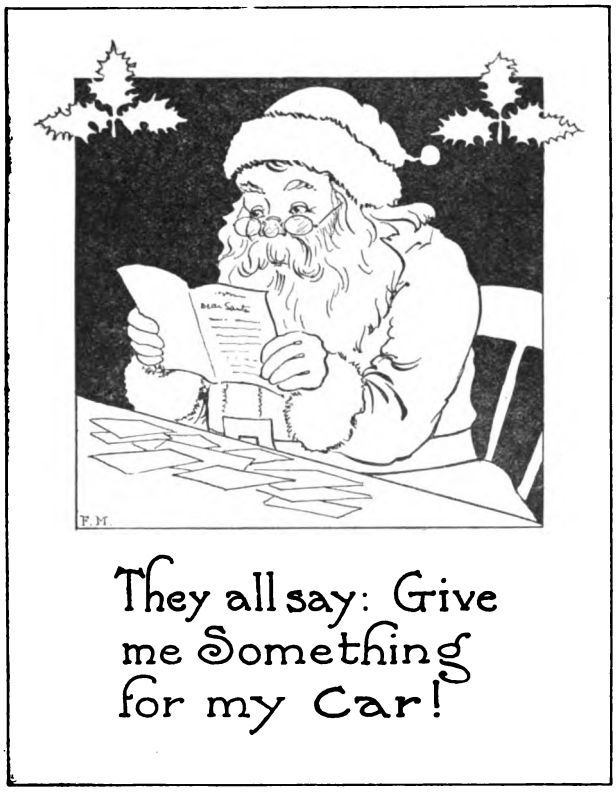
There is nothing accidental about success—it isn't luck or genius—but hard (?) work and concentration. Form a habit of good window displays and the question mark after "hard" slips away without one being aware of the fact that it ever had a place in the line.

It is possible to demonstrate a larger and more important truth than that window dresssing is hard work. It lies sometimes in the point of view. The great university of human experience tells us that prompt and vigorous action will dissipate all thought of procrastination. Many things could be started and half finished while one is thinking whether it is worth while going ahead and making good one's title to supremacy.

Any program is constructive and workable if we will but make it so.

The feeling of perfect confidence in what one is about to do is worth much. It is the mainspring of established trade. There is a boundless satisfaction and a sense of security in knowing that one is keeping abreast of the times. The intelligent storekeeper who inadvertently becomes a procrastinator is invariably conscience stricken

Spread the Idea of an Automobile Christmas, Trim Your Windows and Feature Santa Claus, but DO IT TO-DAY.



Digitized by Google

—because conscience works better when it has a steady job.

Within the past fifteen years standards of quality have been established in window displays and store service. It's all a matter of service anyway—and service is not a vague, meaningless something, but a live, vital, present force in business building.

A man said to me the other day—pointing to a beautiful big auto accessory store on the opposite side of the street, "In that store's rapid rise to recognition you see a succession of brilliant and easily won victories."

The victories only looked as if they were easily won—the proprietor with the aid of good clerks who understood twentieth century service made it a real store—it was a lesson in the separation of the real from the apparent—the permanent store from the mushroom.

It meant an immense amount of work—but not hard work, because the proprietor wasn't the kind of a man to take work that way. All work is pleasant—if one does not feel this way about it, his liver is out of order and a corrective is needed. This man and his clerks found self-development and happiness in the service of others—an ideal worth striving for.

A limited individual horizon is a clerk's greatest handicap. Have your opinions based on an evenfooted acquaintance with life and folks at their best and you can't help being good-natured. This counts for good service in a store and should be sufficiently emphasized in the clerk's make-up to secure to him the good-will of customers, which in turn places prestige to his credit and a substantial raise in salary at the end of the year.

Myers Mopped the Floor.

Christmas is now calling us, and I want to call attention to some Christmas store and window cards that I have drawn for this article, but somehow I must tell this story first. It applies to my subject and it may prove amusing.

This incident happened in the southern part of the State of Texas. I was painting scenery at the time for a big annual fair, but for the moment I had run out of the cigar store to get a smoke and stood just outside getting the spring sunshine when a lady came up to me and, glancing at my poor clothes—old clothes which I invariably worked in when doing large scenic work—she said: "You poor man, and you have such an intelligent face, too, will you do a little work for me around the corner at the charitable institution? I will pay you for it."

"Yes, madam," I replied, "I would be glad to do it for you." She got me a mop and a pail and showed me where to get the water and I started in mopping the floor. There were four very large rooms and it must have taken me about one hour.

When I had finished she wanted to know how I had gotten down so low in the world, and didn't I wish to reform, etc. She handed me fifteen cents, and I gave it back with the remark that I wouldn't take money from a charitable institution. "Well, I know, that's all right," remarked the lady, "but you've got to eat."

"Yes, that's true, too," said I, "but I'm going to the St. George Hotel in a few minutes, just as soon as I change my clothes." "O then you're not a needy subject," ejaculated the lady. "Well, yes, I'm a needy subject all right," said I. "What I need is advice on how to save money—I've got about twenty-five dollars in these clothes and next Tuesday when my contract for finishing up the big show around at the Fair grounds is completed I will have four hundred dollars in my best Sunday suit, and I don't know whether to spend it all in one night or make it last as long as two days!"

I merely mention this little incident to show that a man can do menial work without a thought that it is in any way degrading. The lady was anxious to have the floors cleaned—she was much concerned about it and men were scarce down there at that time—I was my own boss and I helped her out.

A Word to the Sales Force.

So many salesmen complain about their extra work of dressing windows as being commonplace and all that sort of thing. Compel yourself to be good material no matter what position you hold. As a man thinketh, so is he! You cannot build a man out of poor material any more than you can build a delicate and complex structure of humanitarian civilization upon socially negative and destructive doctrines.

Digitized by Google

We know that the great percentage of all men in all lines are failures, and we know equally well that most men who have failed financially and morally are those who first failed mentally and physically. A man knows whether he is making progress or whether he is on the down grade, and if this is a fact, to whom, to what place are we to look for the solution but to the individual himself.

You analyze a man who has made a success of anything and you will find a strong fiber running through his entire make-up.

Whatever you set out to do, know this: IT IS YOURSELF, NOT CIRCUMSTANCES OR CONDITIONS OR INFLUENCES, which will make your success. It is what you FEEL, what you THINK, what you DO—not any one of these, but all of them.

Nerve and ability work in the same direction, but nerve usually gets there first. Nerve and disability will work the same way—you see this illustrated every time you happen to observe a slip-shod, "nobody home, run down at the heels" store window. A man must have an awful nerve to deliberately rent a store on a public street, go into business in a "maybe I'll win" fashion, and expect the dear public to flock to his counters and pour coin into his cash register—if he has one.

"Sure Thing Smith."

I was directing an advertising campaign in a Western city not long ago, and the nearest route to the office from

my hotel took me through one of the most popular thoroughfares. On this street there was a store, splendidly situated, with liberal frontage and everything to make it a very desirable spot for some good, live, red-blooded business man. It was one of that kind of stores (the way it was being run) that made you feel every time you passed by that at any time, any moment, you might expect to find a death notice pasted on the door; and soon after

you might expect to find that the store had changed hands.

In other words, the man inside was really dead, anyhow, but somehow they had forgotten to put the notice to that effect on the door. It got so on my nerves that I deliberately walked in one day and asked the man behind the counter what he would take for the store just as it stood. His reply was somewhat evasive—"I don't exactly know—you'll have to see the boss—I'm only a hired man."

After a little further talk with the clerk I learned that the boss could be seen any morning before 11:30 o'clock. I also learned that the stock was clear of all encumbrance, that the boss was a fairly decent sort of a chap, but "didn't believe in all these new-fangled advertising ways, because it cost too much," and, anyway, he was sure that "most of the fellows that advertised never got their money back."

Of course, naturally, I was astonished at such ignorance, but I did not show it. I was just about to go when the boss came in. I asked the clerk, who had my card, to introduce me, and he did so, handing the boss the card.

"Nothing in your line for me," said he. "I've kept away from that sort of nonsense all my life, and I'm too old to throw away money now."

"Mr. Smith," I replied, "I do not ask you to purchase anything from me, but if you will listen just one minute

Digitized by Google

I have a proposition that I think will interest you. If you will give me the privilege of advertising your goods right here on the premises, using both your show windows, your walls and the tops of your show cases—give me my own way entirely with the advertising end for two months—I will guarantee to increase your business 40 per cent.

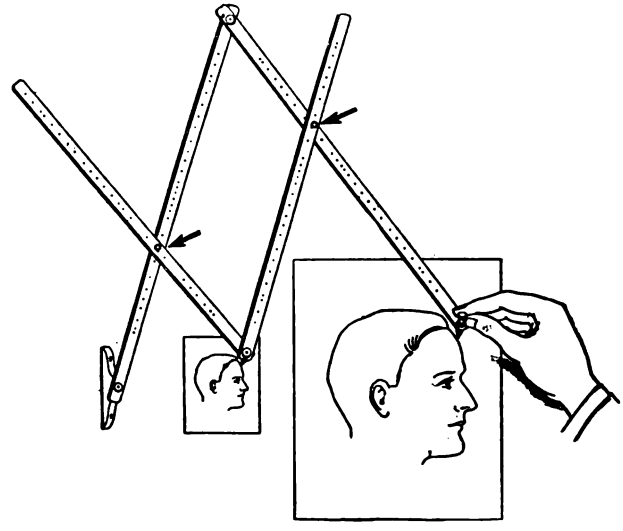
Mind you, I do this all at my own risk. I do not ask you to spend a penny until I demonstrate to you that I have made much more for you than what my charges will come to. If I do not increase your business at least 40 per cent., I lose."

"You seem to be pretty sure of your ground, and as far as I can see, I can't possibly lose."

"That's just the point, Mr. Smith; no other kind of a proposition would appeal to you; that's the only way I can wake you up! And from now on I am going to advertise you as 'Sure Thing Smith.'"

There was nothing the matter with Smith only he was very conservative—he really believed in advertising, but he couldn't let go of funds long enough to see and get results.

I had my special store plan man take his store in hand, and what he didn't do to get the eyes of the people to that store was never thought of. Things went so well that we stayed another month and broke in a man to



Arrange a Santa Claus Booth Inside the Store, if Possible.

carry out some general plans for Smith for the balance of the year.

Smith admitted that his business had increased in those three months just 43 per cent., a little over what I bargained for. "Sure Thing Smith" is known all over that Western city.

And after all, what were the main features of the campaign for "Sure Thing Smith"? First of all, clean windows; next, good window displays with price tickets on the goods; next, pictorial show cards; next, circularizing the neighborhood with detailed lists of what he had to sell.

And last, but not least, every business house within a radius of a mile was supplied with blotters—five blotters

A Pantograph Can Be Used For Copying Any of the Show Cards in This Article For Your Window.

to an office, and each blotter advertising a different article, each blotter invariably carrying a little idea cut to catch and hold the eye. All the store cards carried illustrations. People like pictures.

The old-time plain cards are fast going out, they're too cold. Pictorial cards have a friendly conversational tone and reflect the personality of the store. Why we even got "Sure Thing Smith" so that he could shake hands without thinking he was doing you a favor.

He owns that store now personally, and the entire building. He has enlarged the front and has built out at the back, and does a business that requires the undivided attention of four clerks.

Talk advertising or publicity to "Sure Thing Smith" now and he'll listen to all you've got to say, and he can tell you something about it himself from experience. He's a pictorial window card fiend.

Several ordinary advertising campaigns were picked up in that city outside of the main issue I was busy with, and my, O my, how many other stores needed the pictorial window display and card stunt it's a shame to tell. It is always easier to stay in the old rut than to blaze new trails for yourself.

Window Display Card.

To pull out of a rut and start on an unbroken path means naturally some labor and trouble, so most of us stick to our own ruts. And yet, where would the world be today if no one had the courage to blaze the new trails?

Failure is a habit. Success is a habit. But you can't mix the two. The habit of study is the habit of success. The habit of killing time and shirking is the habit of

Digitized by Google

failure. The habit of success is just as easy as the habit of failure, once you have acquired it, and it pays.

The Ambitious Clerk.

The store clerk who is ambitious and wishes to fortify himself in his position ought to get busy with the pictorial window and store card.

The small prints that appear in this article may be enlarged to window card size by the use of that simple but very able little instrument—the Pantograph. No special experience is required—full directions come with each one.

The Pantograph may be obtained from any up-to-date art shop at prices ranging from 25 cents to $1.50, and I think it is advisable to use the better instrument.

Try and arrange for a Christmas Gift Selling Booth inside the store. A large Japanese parasol painted white, with cotton batting thrown over the top and a Santa Claus of painted card board holding up parasol, will make an attractive booth at trifling cost.

If you wish to have a real, live snow storm back of booth or at back of window you can have it by using our patented snow storm machine. Write the magazine for more particulars.

The Metal Turning Lathe.

Part 4—Shaping and Grinding the Lathe Tool, Cutting Threads, the Use of the Steady Rest and Correcting Centers.

BY J. F. SPRINGER

THE grinding will be a matter of resurfacing the top face and bringing it to a new flat surface parallel with the old. If the nose needs, however, to be heated for the purpose of reforging, we may have a good deal to do besides. It would seem advisable to seek to avoid all reforging if possible, in order to prevent warping and other deformations, which lead to the necessity for extensive grinding. Now it may happen that, when we regrind a dull tool, even though we grind only the top surface, we may heat up the edge enough to destroy part of its hardness. This will require that we reharden the tool. And rehardening requires reheating and possible warping.

Care In Grinding.

The thing to do, then, would appear to be to handle the grinding in such a way as not to affect the hardness. About the only sure and simple way is to grind in water. We may arrange for a stream of water direct onto the nose of the tool. Let this stream be rather a generous one, fully up to its duty of carrying off the heat generated by the friction of grinding. If this is done, we may reasonably expect that, in many cases at least, we shall have no other grinding to do after we are once at work than the mere resurfacing of the top of the nose end of the tool.

The grinding and regrinding will naturally result in wearing down the nose of the tool on top. We will need to pay attention from time to time to the matter of making sure that this top surface is exactly on a level with the axis of the prospective screw. This is an important matter, wherever an accurate screw thread is to be cut.

In cutting a screw thread, as in lathe work in general, the final cuts should be very light ones. This matter is, of course, regulated by the hand.

Screw threads are of many kinds. One of the principal varieties is the 60-degree, sharp V thread. With this thread an axial section shows an equiangular triangle, each of whose angles is 60 degrees. The corners are either left sharp or are rounded a very small trifle. The groove is precisely the same as the thread. There

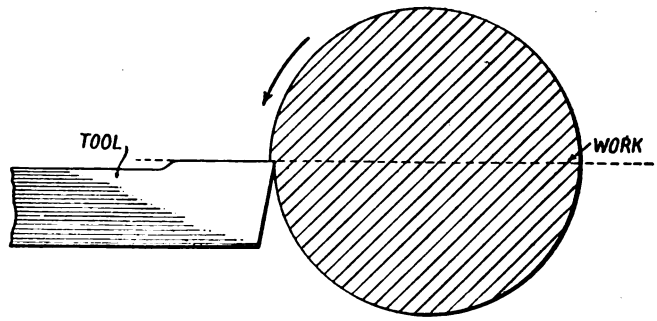


Fig. 3.—The Top of the Cutting Edge of the Tool Nose Should Be on a Level with the Center Line of the Work.

is another type of thread in which the top of the thread —and the bottom of the groove—is flattened.

Then there is the Whitworth (British) thread in which the angle at the top of the thread is 55 degrees. So also with the bottom of the groove. Then the top of the thread and the bottom of the groove are decidedly rounded. There is also such a thing as a square thread, including a square groove. The lead screw on the lathe

Digitized by Google

will probably have a square thread. But the threads that are more or less pointed are the ones in common use. They may be cut by following the directions I have given.

Making the Tool.

Perhaps the most difficult matter will be the making of the tool to do the cutting. The vital thing in forging and grinding the cutting end will be the accurate shaping

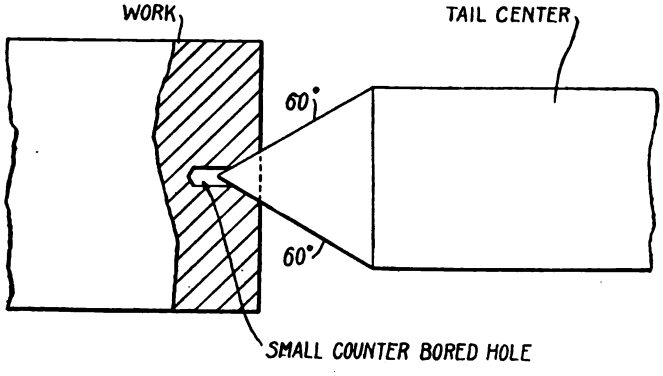

Fig. 4.—Showing Section of Counterbored Work and 60° Tail Stock Center.

and sizing to the exact form and size of an axial section of the proposed screw. This work done, the rest ought not to give much trouble, unless we attempt to deviate from the directions I have been giving.

The work of screw-cutting that I have been explaining concerns particularly external threads. In the shop, however, we shall have to deal with internal threads as well. Ordinarily we will do the cutting by means of taps.

Let us now consider a point or two with regard to the mounting of the work for external screw-cutting. The work will ordinarily be put together in a chuck and be supported entirely by the head stock or else it will be mounted between centers set in the head stock spindle and in the tail stock. Where the latter method is applicable, it will probably be found to give the most accurate results. There are many cases of work having small diameters and short length for which a mounting between centers would be almost or quite absurd. Then there is work which cannot well be set up between centers.

There is one thing to remember with great faithfulness in connection with work mounted in a chuck: Never disturb the work after it has once been secured and the cutting started. Work mounted on centers may be taken off when half done and put back again later for finishing, without serious danger of getting it "out of center;" but this is not the case with ordinary mountings in chucks. When you have once begun, then, don't let up until the job is finished. Of course it may be left on the lathe over night or over Sunday, provided it is not disturbed. The cuts should be light, even from the beginning. This reduces the work's liability to dislocation or to bending. A fairly high speed and a very light cut is the combination suitable to thread cutting.

I have already used language implying that exactness might be expected when the work is mounted between centers. This should be understood in reason. It is possible to mount the work imperfectly, which will then make errors possible. Besides, work mounted between centers will often be long and of rather small diameter as compared with the length. Such work is liable to bending during the cutting operation. There are at least two remedies.

The Steady Rest.

First, the work may be supported at a point intermediate between centers by means of a **steady rest**. This is an upright frame or bracket suited to support the work without interfering with its rotation. The steady rest may be shifted from point to point as the conditions at the moment demand and permit. The second remedy is gentle cutting. High speed and a light cut constitute again a very good combination.

I come now to the matter of mounting the work on the two centers. The center in the spindle of the head stock rotates with the work—it is a live center. The tail stock center, on the contrary, remains fixed. The work twists around on its point. The two centers have conical points. These should be neither too slender nor too blunt. If the full angle of the conical vortex is 60 degrees, the center will be just about right for average work.

Conical holes, also with 60-degree angles, are bored in the ends of the work. These should be deep enough to cause the support given by the two centers to be supplied in part by rather thick portions of the center points. Then the conical holes should be bored deeper at the bottom by an ordinary cylindrical drill bit of small size. The depth of these little holes should be more than sufficient to enable the conical center points to be introduced

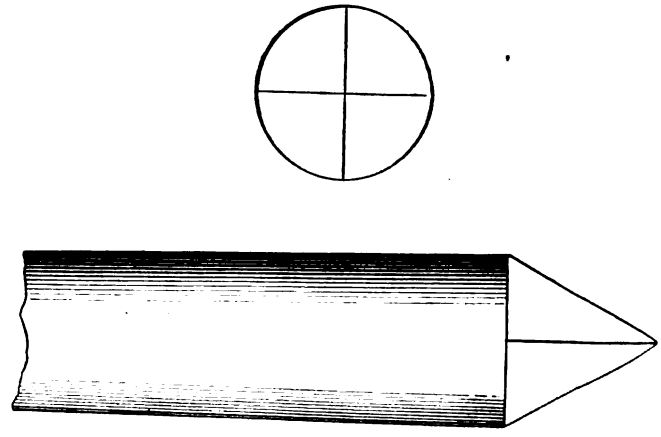

Fig. 5.—Hardened Tail Stock Center with Pyramided Point for Correcting Centers.

into the conical holes and brought up tight without running any danger of the extreme tip of the center point coming into contact with the metal of the work. Make the little holes deep enough and to spare. The object in view is to prevent damage to the tip of the center.

The lathe operator may find that it is not at all easy to bore the conical holes so that the work will run true. There are two difficulties. First, the holes may not be started in the exact centers of the ends of the work.

Digitized by Google

When it occurs, this is a bad error and calls for correction before going on with the work. The second difficulty is to keep the conical hole central with the work as we continue to bore it.

It is a bad error to get these holes out of line with the axis and consequently very probably out of line with each other. However, in respect to both difficulties, it may be as well to say at once that slight errors may often be corrected.

The following method may be used with a view to correcting small displacements of center holes. Provide a piece for the tail stock that shall be a duplicate of a center point with the exception of two things. First, instead of a conical point, a three-cornered or four-cornered pyramidal point is used. Second, this point is to

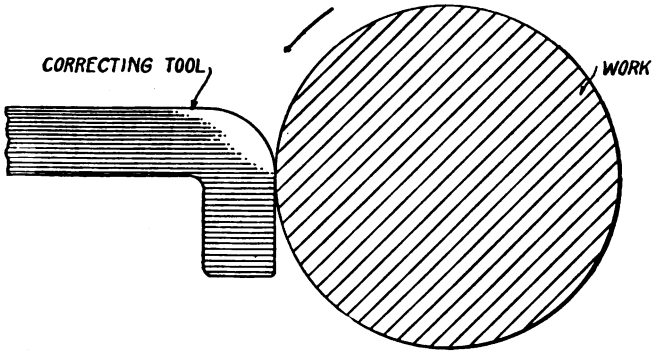

Fig. 6.—Illustrating Method of Correcting Center Hole, Slightly Out of Center with Axis of Work.

be hardened. It is proposed to use it as a boring tool. To do this, the work is run on this tool as if it were the dead center.

Correcting a Poor Center.

Use plenty of oil in the center hole and on the center point. Now bring a tool up close to the work—say, half way between the ends—as if it were the intention to make a cut. By rotating the work, by running the lathe slowly by hand, it will be noticed that the work approaches and recedes from the end of the tool. This is because the center holes are wrong. Now, instead of a cutting tool, bring up against the work a blunt piece of steel. Have this piece held firmly in the tool post. As the work goes round, the hand being used as before to effect rotation, the work will rub the blunt end for a moment and then be out of contact with it.

The idea now is to gradually force the blunt piece against the work. A slight cutting action will start up in the center hole at the tail stock end of the work. Continue to press the tool forward until the work runs perfectly true and bears evenly against the blunt piece all the way round. The operator must judge when he can use power to work the lathe. When beginning with power, begin with a very slow speed and feel your way.

When the hole at one end is in perfect shape, take the work out and reverse it. Then do the same for the center hole now bearing against the pyramidal center point in the tail stock as you did for the other hole. Start by working the lathe by hand, and feel your way as before.

CLEAN THE OILING SYSTEM.

Do Not Expect To Avoid Big Repair Bills Unless You Attend to the Oil Supply and Keep the Engine Lubricating System Clean.

THE average car owner is prone to follow the instructions which he finds in the book which accompanies his car, and he is careful to do nothing, unless he finds a suggestion in a magazine or in that same book of instructions.

He fills the base of his engine with lubricant when oil is necessary, as indicated by the gauge, and he is careful to see that the oil flows through the gauge, if there is one, on the dashboard, or careful to see that the pressure remains at a certain figure while the engine is running. The instruction book does not always advise the owner further regarding the oiling system. At the present time, however, more instructions are necessary.

You may have liquid in the base of your engine, but is it a lubricant? Many times this liquid is a combination of cylinder oil and kerosene. Its lubricating properties are poor, and should the bearings burn through lack of oil the owner is very apt to blame the oil for the trouble. He immediately buys oil of another grade or oil that is made by another manufacturer, without, however, knowing the reason for his trouble.

Depending upon the type of engine, oil in the base should be changed regularly. Old lubricating oil should be drawn out from the base and thrown away and new put in, for at least every thousand miles of riding. In some cases it is advisable to renew the oil much oftener.

Make a point of cleaning it with kerosene every time the lubricating oil is renewed. Put in about one quart of kerosene and turn the engine over by hand, with the petcocks open, a dozen turns or so. The kerosene oil will dissolve the particles of grease and have a tendency to drive out the dirt. It is not advisable to run the engine while the kerosene is in the base. It may do no harm. On the other hand, there is a great possibility that it will damage the engine.

After the engine has been cleaned in this way, draw off the kerosene, and while the drain cocks are still open turn the engine over two or three times in order to drive the kerosene from the system. Clean the pump strainer if there is one, then put in a good grade of oil.

AN EXPLANATION.

The delay in issuing the October number of the Automobile Dealer and Repairer was caused by a strike of the Press Feeders as the result of which our entire edition (only partly printed) was held up for several days. We regret of course the delay in mailing this edition to our subscribers, but they want to reflect that when a Labor Union takes a notion to go on strike it does not for one moment consider the wishes of the publishers or care how much inconvenience or loss may be entailed by their action.

Digitized by Google

The Care and Repair of Bearings

Part 2—Your Engine Will Knock Always Unless You Exercise Great Care in Scraping the Bearings.

BY J FRED GILMAN

WHILE ball or roller bearings are usually of great importance in the automobile, they are seldom used in the engine itself, the main part of the machine.

The engine is usually fitted with bronze or babbitt bearings, made in halves and carefully fitted to the shafts. Manifestly a soft babbitt bearing will not keep its shape unless it is fitted to the shaft. If it contacts upon a small surface it will soon be hammered out until there is considerable play in the shaft. On the other hand, if it is clamped tightly upon the shaft, excessive friction results and the babbitt is quickly burned by the heat.

To locate the points of contact, the points where the shaft runs against the babbitt, the prussian blue method is used. The shaft is coated very thinly with prussian blue paste and the bearing put into place on the shaft. The high spots are "printed" upon the bearing, and these high spots must be scraped off. The action is repeated again and again until the shaft contacts with the bearing upon practically its whole surface.

We all know how very much more difficult it is to keep your "print" when fitting bearings to an easy-running fit. The reason for this is that when a shaft is put up tight, the shaft tends to distort the case to its alignment, and *vice versa*. It might be possible to scrape in a shaft so that it turns very easily, and if the shaft is straight and bearings show a print practically all over the alignment will be practically perfect. But where can we get the men to do it, and what will the customer say about the time spent?

Scraping Bearings.

The scraping of automobile bearings has always been a job of more or less uncertainty and is recognized by all repair men as a difficult task, requiring the best men obtainable, to put up a set of bearings that will line up and fit the shaft as they should.

When the engine base is placed on a suitable stand, fitting bearings is an easy matter, as the effect of tightening any of the boxes or journals is easily determined by inserting a bar of iron or steel between the flywheel retention bolts on the crankshaft flange and turning that member with the bearings tightened to the proper degree. This is the method of turning the crankshaft when the bearings are being scraped in by fitting.

The camshaft supporting bearings need attention, but these are plain bushings for the most part and new ones are easily made and inserted. The method of retention is fully as important as proper fitting. Even in such a simple matter as securing bushings there is a right and wrong way, and it is noticeable that the majority of mechanics use the less desirable method. For instance, the cone-ended set screw may be screwed in so tightly as to cause the bushing to bulge slightly under the point and bind the shaft, especially if the wall of the bushing is light. Then again, should the set screw become loose, the bushing can move out of position, an undesirable feature, especially if two holes are supposed to be kept in register by this means.

Before refitting the main bearing it is desirable to remove the engine flywheel from the crankshaft to facilitate handling that member.

If the engine knocks when travelling over level roads, regardless of speed or spark lever position, and the trouble is not due to carbon deposits in the combustion chambers, it is reasonable to assume that the bearings have become loose and there is lost motion at the main journals, the connecting-rod big ends, and possibly the wristpins.

The main journals are usually proportioned with ample surface, and will not wear unduly unless lubrication has been neglected. The connecting-rod bearings demand attention from time to time, however, and sometimes the main bearings will be loose enough to warrant taking up.

After the bottom of the engine base has been removed, exposing the internal mechanism, it is not difficult to ascertain the condition of the bearings and make the proper adjustment to compensate for deterioration.

When the bearings are not worn enough to require refitting, the lost motion can often be eliminated by removing one or more of the shims separating the bearing cap from the seat, care being taken that an even number of shims of the same thickness are removed from each side of the journal.

If there is considerable lost motion it is advisable to dismantle the engine and examine the crankshaft and the journal brasses. If the shaft is scored or cut in any way, as often results when bronze is used, and the bearings do not receive clean oil in sufficient quantities, the surfaces must be trued up, either with a fine file and emery cloth, or by means of a lapping tool. The latter is preferable, as the file and emery cloth will only tend to smooth the surface, while the lap will have the effect of restoring the crank to proper contour.

In many garages it is the custom to put in bearings in the following manner: The shaft is taken, as removed from the crank-case, without any attempt at straight-

Digitized by Google

ening; a light coat of prussian blue is applied to the journals and the shaft then rolled in the upper half bearings, the bearings being supported in the upper half of the case, which is inverted and placed upon a jack or other device.

The high spots, as shown by the blue from the shaft, are then scraped off and the shaft again rolled in the bearings, and the high spots scraped, until in the judgment of the mechanic there is a sufficient area of bearing surface. The shaft is then laid in the upper bearing and the blue again applied, a shim or shims removed, and the caps bolted in place. The shaft is then revolved to show prints on the caps, the caps then removed, and the high spots scraped until they show a satisfactory surface. The job is then considered finished.

The difficulty with this method is that the shaft is scraped in under conditions that do not prevail when the engine is assembled. All prints should be taken when the caps are bolted down on the shaft. If the prints are taken as described, in the upper half of bearings, one will find that the shaft assumes a very different position when the caps are bolted down.

An easy way to prove this is to scrape in an engine as above described, and after the job is all done scrape lightly all the high spots from the upper half bearings and caps, then blue the shaft and take a print of both bearings with the caps bolted down.

One of the best methods that I know of for producing a good job is as follows: First, it is useless to attempt to scrape in a set of bearings with a crooked shaft. The shaft should not run out more than .001 inch, and if the journals are out of round, or tapered, a very good way to put them right is to put the shaft on centers in a lathe, if a grinder is not available (and it usually isn't), and take a very light chip over the main journals; usually from .003 to .008 inch will be enough. Use a very sharp-pointed side tool to prevent chattering.

As a further aid to avoid chatters, it is a good plan to suspend a weight (about twenty pounds) from the bearing next adjacent to the one on which the cut is being taken, using a belt lace as a means of suspension.

The next thing is to prepare the bearings for scraping. There are many things to be taken into consideration when fitting the bearings, and it is well to remember that proper preparations will take one a long ways towards good results.

The proper mesh of the gears is of great importance in turning out a quiet engine, and if the gears are loose it requires more metal to be scraped out of the top bearings than the bottom; if, on the other hand, the mesh of the gears is correct, or too tight, it will be necessary to insert a shim between the upper half bearing and the case in order to provide sufficient metal to scrape out and make a proper fit on the shaft.

If a shim is inserted, as described, the edges of the brass must be filed flush with the case. Clamp the brass into the case when filing to insure its being properly seated, using for the purpose small "C" or parallel clamps.

If shims are inserted between the brass and the case it is a good plan to allow them to make the complete half circle. But, as this makes a great amount of scraping on the sides of the bearings necessary, it is customary to graduate the width of the shims, putting the narrowest in the center and working up to the wider ones. If this is done, it is advisable to sweat them all together, and sweat the combined lot to the brass, thereby preventing them from shifting.

The ideal way to scrape in a shaft is to remove shims, or file caps, or pack under the bearings, as the case may be, a little at a time. At all times bolt the caps down tightly, and also allow the shaft to be turned with the freedom desired for the completion of the job. This is a slow process, but insures the mechanic against the loss of the bearings when the job is nearing its finish.

Reading the prints for alignment is rather difficult to describe in print. In considering a three-bearing shaft we will call the front bearing No. 1, the center bearing No. 2, and the rear bearing No. 3. If the print is light in No. 2 and heavy in No. 1 and No. 3, reading the upper half, scrape No. 1 and No. 3, and probably the cap of No. 2, which will show heavy if these conditions prevail.

If the print shows light on one side of No. 1 and the opposite side of No. 2, scrape the heavy sides of both bearings, but leave a little at the upper edge to crowd the shaft over. This must be done with judgment, so when the job is finished there will be no crowding of the shaft, as this will cause disalignment.

In removing shims and taking up bearings by removing the lower half of case, the mechanic must be guided wholly by conditions. If the engine is in fairly good shape this method is undoubtedly permissible.

It must be remembered that the constant tendency is for the shaft to wear out of alignment, and after doing the job in this manner a few times it will be found that the "knock" disappears for a shorter period each time. The only remedy, then, is to align the bearings properly.

In scraping the high spot, it is best to rub off the excess "blue;" the spots will then show to their actual extent, and not mislead the mechanic into doing scraping where it is not needed. Take care not to fit the shaft too tightly.

In no other branch of mechanical work are such liberties permitted to be taken with bearings that are required to be in perfect alignment as in the automobile repair business. Consider the manufacture of machine tools, for instance. A lathe costs, we might say, $600. The builder spares no pains to secure perfect alignment, using for this purpose accurately ground lining bars, sized discs and carefully graduated sweeps, the entire equipment

Digitized by Google

costing many times the price of one lathe. An automobile costs from $500 to $10,000, and yet we turn a supposed mechanic loose on the job with a socket wrench and an old file made into a scraper (which makes a good one, by the way) and wonder why we don't get good results.

Forethought and care in scraping bearings will add greatly to an engine's silence and power qualities.

Four Suggestions for Christmas

Whether Young or Old, You Can Make Something for the Family Machine as a Christmas Gift for Father.

BY F. L. ALLEN

THE youngster, or even the twelve-year-old, who is attending school where manual training is taught, always has an idea that he must make something for Christmas for each member of the family. He, too, can make this Christmas an "automobile celebration." There are many things that the young fellow who is even an amateur at tools can make, and we are giving a number of suggestions for him in this article.

Before we give any descriptions, let us make one suggestion that the writer has found of great importance. The suggestion is contained in two words, "cigar boxes." One has no idea how many things can be made from cigar boxes, not from the boxes themselves, particularly, but from the wood that is contained in them. With a little careful practice using a saw, a cigar box, some glue and clamps, the amateur can make boards two inches in thickness and any width.

The joints where the cigar box boards are butted together will barely show if a very fine saw is used. If the amateur has not had experience in joining, he can obtain this experience in about two hours by cutting off short pieces of the thin wood. This wood is much easier to work than ordinary. In cutting thin wood of this sort the amateur will find it best to place the square upon

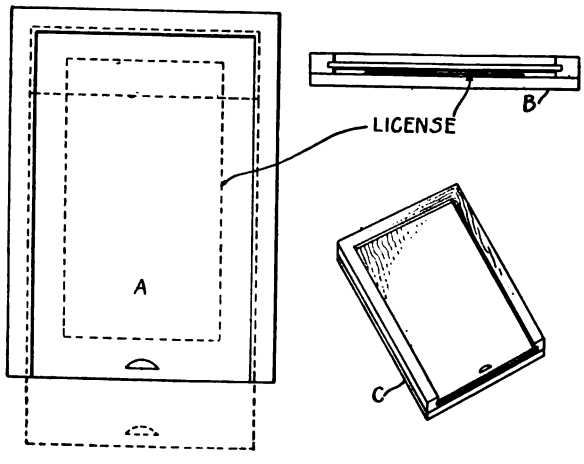

Fig. 1.—A Handy License Carrier.

the piece of wood to be cut and use the square to guide the saw.

An old letter press makes an ideal clamp for holding the pieces while they are being glued together. Any of the articles illustrated in this article can be made from two pieces of cigar-box wood glued together. In some cases a finer effect may be obtained by gluing thin frames upon a large piece of flat board.

A License Carrier.

In Figure 1 is shown a handy device for the automobile. If you have ever been with father when a traffic officer held him up you will know how embarrassing the situation was. Father hunted through his pockets, under the tonneau seat, in the tool box, and back of the cushions for his registration card. Probably he found it folded up in a little ball in the tool box, discolored by oil and with its corners torn off.

It might have satisfied the traffic officer for the time being, but with this treatment the license card grew no more legible. Why not have it in a place of its own? An easy enough matter if you make a license holder as shown in Figure 1. Upon a flat piece of cigar-box board about one inch larger in each dimension, as shown at B, than the license, make a frame from three thin pieces of wood. The middle piece of this frame is slightly narrower than the top and the bottom pieces, so that a groove is left in which the cover A will slide.

The cover A is nothing more or less than another piece of cigar-box wood of its original thickness. The license can then be pasted to the board B and the whole screwed beneath the seat or behind a cushion. The cover will protect the license at all times, while the license can be inspected very easily.

If the device can be placed somewhere where there is no danger of breakage, such as beneath the seat above the gasoline tank, then the cover A may be made of glass, and since it need not be removed to show the license, a thin piece of board may be tacked over the end to hold the glass in place. Do not glue this last piece of board in place, for the reason that as the license is renewed from year to year it must be pasted over the old one.

Light Bulb Box.

A tool box is usually a catch-all for everything. In it may be found everything from cotter pins to 24-inch Stillson wrenches. Very frequently the automobilist carefully places headlight bulbs in one corner of the tool

Digitized by Google

box, possibly surrounds them with a strip of old newspaper and expects to find them in good condition when his headlight bulbs go out some evening. He usually finds them there—that is, he finds the pieces of the globes there and all of the glass, but not in the same condition as they were when he purchased them.

He usually collects the glass with a teaspoon or digs it out with his fingers. It is an easy matter to prevent bulb damaging by providing a box especially designed for the bulbs. The box should be screwed to the upper part of the tool box, out of the way of the rest of the tools, and in such a position that the heavy articles cannot hit against it and break it.

Make an ordinary box slightly larger than necessary to hold a set of bulbs, consisting of two headlights, two sidelights, a tail light and a clock or instrument light. Now into this box build a partition, as shown at D. In it bore the six holes for the light bases. The lights will jar out of place very easily unless some means is had for holding them in place.

A piece of spring brass wire should run across beneath

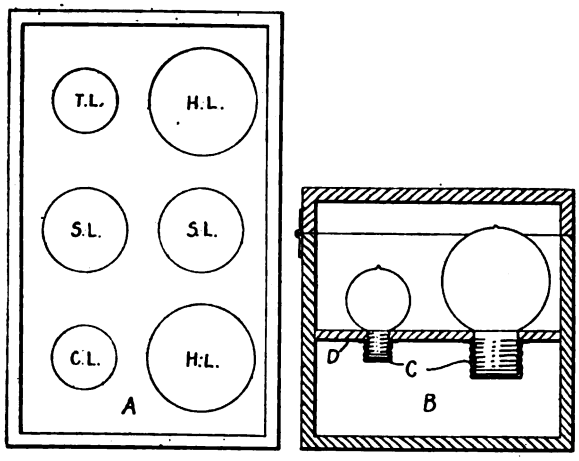

Fig. 2.—Light Bulb Box.

the partition so that it overlaps each holder about one-quarter of an inch. When the light is slipped into place this brass wire will press against the base and hold the lamp so that it will not jar.

Every accessory store sells special receptacles, as shown at C, which may be screwed beneath the partition if the spring brass wire is not available. Both of the devices spoken of are illustrated in Figures 1 and 2 and may be painted to match the car. The inside should be shellacked to keep out the moisture and prevent them from warping.

Keeping Spark Plugs.

A device shown in Figure 3 is another easily made accessory which every car owner should have. It is intended to hold spark plugs and is made from a heavy block of soft pine and cigar box boards. The heavy piece of pine board should be drilled with four large holes to hold the bases of four plugs. Do not drill the holes too large. Try to have them about 1/16 of an inch smaller than the outside diameter of the threads, and screw the spark plugs into them by means of a wrench. In this way the plugs will be held very tightly and there will be no danger of damaging them because of their jarring around.

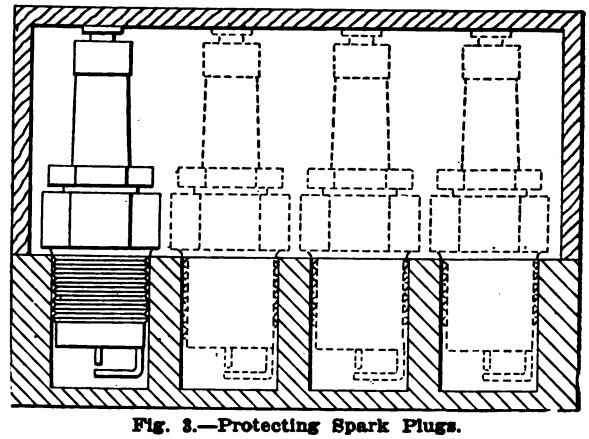

Fig. 3.—Protecting Spark Plugs.

If father's car is not fitted with a clock on the instrument board, a very acceptable gift along this line can be made for him, as shown in Figure 4. This device also can be made from cigar box wood. Each corner, however, should be reinforced by having a small piece of wood glued into it. This piece of wood is omitted in the diagram in order to simplify the sketch.

The face of the fitting, as shown at A, should be slanted somewhat if the dashboard is straight and is put into place last. B should be made of spring brass about 1/16 of an inch thick and bulged outward slightly in order to keep the watch from rattling. Be sure to obtain a watch that can be wound and set through the stem. Otherwise the face A will have to be removed every time the watch is wound or set. This last device should be finished the color of the dashboard, and it is well to add a word about finishing cigar box wood.

Staining the Wood.

Diamond dyes make an exceedingly good stain for coloring wood to practically any color desired. Diamond dyes for wool should be used in all cases and mixed with

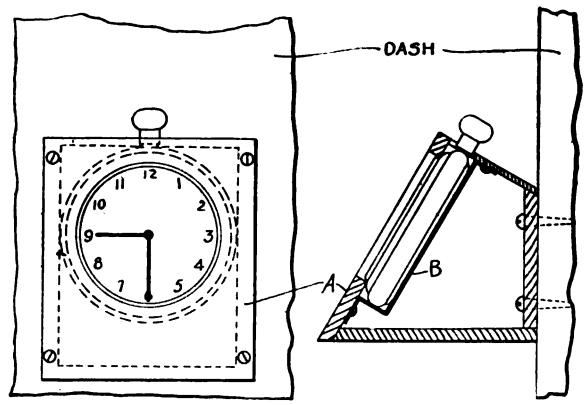

Fig. 4.—Dash Board Watch Carrier.

alcohol. For staining wood mahogany the colors old rose and brown are used and mixed in separate solutions.

Always stain the article slightly darker than it is finally intended to be, using first the old rose stain, then the

Digitized by Google

brown. Do not be afraid to leave streaks in it. As a matter of fact, try to leave a number of dark brown streaks with the brush. Then shellac it with a very fine coat of orange shellac. After this coat is dry smooth it with pumice stone and oil and apply about six coats of shellac.

Before the final coat is applied, repeat the smoothing operation so that the last coat will be smooth and shiny. If a dull stain is desired the last coat of shellac may be rubbed with a little pumice stone and oil, very lightly. The result will be a dull mahogany finish that will have as good an appearance as a costly mahogany piano.

Some Helpful Hints from Ohio

A Number of Interesting Suggestions From the Middle West About Automobile Care and Repair.

BY JAMES F. HOBART, M. E.

THE appearance of the nuts on some automobiles are often a pretty good indication of either the skill or the knowledge of the man who takes care of the machine. A repairman in an Ohio garage recently told the writer that he was pretty apt to judge the owner or the operator of an automobile by the appearance of the nuts which required removal frequently.

"When I find the nuts all chewed (see A, Fig. 1) with the corners torn off," said the garage man, "I make up my mind that the man who takes care of the car is either a lazy chap or that he does not know his business. There are so many wrenches to be had nowadays which will fit any and all nuts perfectly, that there is no excuse for a machine coming into the shop with half the nuts looking as though they had been run through a stone crusher.

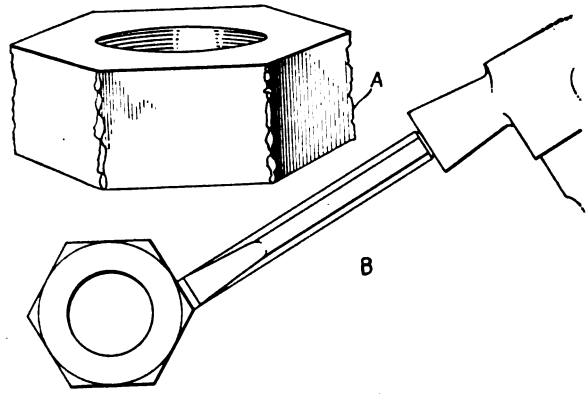

Fig. 1.—Turning Nuts with a Cold Chisel.

"The use of a too large wrench will damage a nut, but the bad habit of turning a nut with a cold chisel is responsible for most of the 'chewed-up' nuts which are found in automobiles. A nut in a pretty bad corner may be removed or tightened by means of a cold chisel and hammer, as at B, Fig. 1, but it does neither the nut nor the bolt any good and frequently has a bad effect upon other and adjacent parts of the car. There are stresses, sometimes, set up in bolts by the use of a cold chisel for loosening nuts, which weaken the metal of a bolt and sometimes hasten a sudden failure of the metal through crystalization.

"There are times when it may seem necessary to use a cold chisel to remove a nut, but it is NEVER necessary to use a cold chisel to replace any nut in any car, for the garageman who is fit to overhaul cars will have provided himself with the necessary wrenches for replacing ANY nut in any car. If he cannot buy such wrenches, then he should MAKE them, and make them before he puts that car together again!"

"I never screw on badly worn nuts when I overhaul a car," remarked the garageman. "All the worn and 'chewed' nuts go into the scrap box and I put new nuts in their places. The appearance of the overhauled car is far better with new and perfect nuts on the bolts. Just try it on an old car once, and see how the new nuts improve the looks of things."

"Alligator" Wrenches.

"One very vicious practice which is never tolerated in my shop is the use of 'alligator' wrenches for removing nuts or spark plugs. I will never allow a workman to put an alligator wrench upon any piece of metal which has been squared to receive a wrench. The only purpose for which the 'alligator' is tolerated should be for holding round sections, as at C, Fig. 2, to which an ordinary wrench cannot be applied. Keep this in mind when an alligator wrench is taken in hand and the car will look nicer, the nuts hold their corners better.

"Think I'm a bit 'cranky' on alligator wrenches? No, sir! I'm not! Why, I worked for one man, and a good mechanic he was, too, who wouldn't allow an alligator wrench on the job. He warned all his men, and he had several, to take the wrenches of that character home and keep them there.

"But one day he came across a big eight-inch alligator wrench lying on the floor beside a machine which was under repair. The 'Old Man' never said a word to anybody about that wrench. He just picked it up and gave it a heave out of the window into the river which flowed close past the shop. That settled it. I never saw another alligator wrench in that shop."

"It does get past me," recently remarked the owner of

Digitized by Google

an automobile repair shop about 100 miles south of Cleveland, Ohio, "why users of motor trucks will not 'wake up' to the fact that adequate service repairs are not just as necessary to the motor truck as to the automobile. But, somehow, the truck users do not yet seem to have been educated to the understanding possessed by the better class of car drivers.

"There are still a few automobile drivers, principally 'tenderfeet' at the game, who drive around in animated

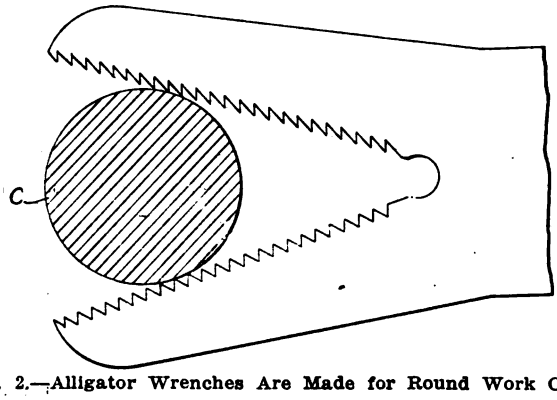

Fig. 2.—Alligator Wrenches Are Made for Round Work Only.

scrap heaps, with noise coming from each and every bearing and connection. But such vehicles are the exception, rather than the rule, for automobile drivers have learned the lesson that noise means wear, and that their car will not last as long when allowed to rattle and thump, as when everything is kept snug and tight.

"But the small truck driver and perhaps owner, has apparently not yet found out this great truth, so he lets the noise go, seemingly caring nothing for anything save that the truck 'will run' and that he can do his daily work with it. It is for this reason that so many light delivery trucks—converted automobile passenger cars, most of them—are running about the streets in such an offensive rattle-to-bang manner. Their owners or drivers are not yet wise that they are wearing out their cars twice as fast as needs be done just because of the needless rattle and pound.

"But the motor-truck-using people are waking up to the fact that a truck, like any other machine, must be kept in good mechanical condition if it is to be kept out of the scrap heap. A good deal of my time is freely given to the education of truck drivers; trying to show them that they are unnecessarily reducing the mileage of their converted delivery machines by not keeping the bearings and connections free from thump, noise and pound.

The Time Is Well Spent.

"Yes, I spend a good deal of time in that way, take it all together; but let me tell you, sir, the time is mighty well spent, for it brings me in large and direct returns. I believe that each hour which I have spent with truck drivers and owners, preaching to them the 'gospel of repairs in time' has brought into my shop a day of profitable work for myself and my help.

"No, I didn't say 'my men' for I haven't any men in the shop. Can't get 'em, either. About all the auto repair men are 'over there,' and I would be with them were I 20 years younger. I have to get along with one man—got a bad leg, you know—and a couple of girls. And say, they are all right too. At first they were a bit 'finicky' about getting next to dirt, grease and slush, but since they have really found that grease and grime can be washed off same as can the dirt from pots and kettles, these girls have gone right down into the 'reason why' of automobile repair matters and will do as well as men as soon as they have had as much experience.

"Tell you what—I believe there are not many things in the mechanical line which some women can't do as well as some men, provided they have the same incentive to, and do take as deep an interest in the things to be done.

"Just as soon as the woman in factory or garage realizes what there is in mechanical matters for her, she will be as keen to go after those things and to understand them from A to Z as any man. It makes a woman mighty self-respecting and self-reliant too, to get a bit of mechanical knowledge and experience. Seems to have opened a new world to her, which she enters with great pleasure and profit. Yes, I said SOME women, and you will also find that I said 'some' men, too!

"Autorepairettes!"

"They like the work, too," continued the garage owner. "The other day I heard them talking as one was under a car disconnecting the rear axle and the other girl was taking out the valves preparatory to regrinding.

"One girl said to the other, 'No, Mary, I won't give

NAME OF TIRE CO.

RECEIVED	TIRE No.	SOLD	NAME AND ADDRESS

Fig. 3.—A Handy Tire Memorandum Form.

up this business when the war is over and the men come back again; why, this is real work. You never will find me behind Woolworth's counters any more. I shall stay right in the automobile repair business!'

"'Yes, Jenny,' the other girl replied, as she loosened a refractory plug, 'And you will never see me doing embroidery or crochetting again after finding out how very much there is in this work which is so interesting!' "And then," said the garage man, "I called both the girls to

Digitized by Google

slip a couple of inner tubes into the rear wheels of the car of a society lady who sat in her car while the work was being done, and, bless me, if I don't believe that dame got so interested in the work that she will be over here soon, wanting to put on overalls and grease and get right into the work herself—blamed if I don't!"

"You're a 'Clutch-Rider'!"

Some pretty loud talk over in the corner of a little repair shop in Central Ohio attracted the writer's attention, as he chanced to be standing in the doorway looking into the shop. The voice of the repair man rose loud and clear as he "bawled out" a customer thusly. "Yes, I mean just exactly what I say; you're a bloomin' clutch rider, and that's what's the matter with your automobile clutch, and all that's the matter with it too!

"You always drive with your foot on the clutch lever, don't you? Yes, I know what you would say, that your foot barely touches the lever and never puts any pressure on it, but that is not so. Your foot does put some pressure on the lever and that pressure is transmitted to the clutch mechanism. Your clutch is a cone, and here you see, the facing is badly worn, the thrust bearing is nearly worn out and you come in with the complaint that the clutch was slipping!

"Sure the clutch slipped! How could it help slipping under all the abuse to which it has been subjected through continuous pressure on the lever from that foot of yours? If you want the clutch to stay in good condition, quit riding on it. Keep the foot off the lever and then there will be no trouble. But just as long as you play the bluejay act, and drive with the 'longest toe behind' resting upon the clutch lever, then just so long are you going to have these same clutch troubles and perhaps get smashed up through failure of the clutch to hold during a sudden stop. No, my friend, 'clutch-riding' is bad. Don't do it!"

"What have you got there?" the writer asked of a repair man who was entering some figures from a pad upon one of the cards in a neat catalog case.

"Oh, that is my serial tire numbers. Some time ago I started to keep a record (see Fig. 3) of each tire through the serial number which is embossed on the body of the tire. I put the name of the tire manufacturer at the head of a card, then down the left side I leave room for my dating stamp, and then I put the tire numbers in a row with the date before each number, which tells when the tire came into my possession. Then when a tire is sold I stamp the date of the sale after the number of the tire sold, and after that date I write the name and address of the customer who purchased the tire, or, if I do not know his name and address I set down the license number of the car which was fitted with that tire.

"Handy? Well, I should say so. It is sure a 'dead give away' when a car has been stolen and one of those tires is found in the hands of a junk dealer. And it is very handy too, when a tire goes bad before it has made the mileage claimed for it. The manufacturer hasn't a word to say when you fire at him the serial number of the inferior tire. Then he has to get right down to the 'box of brass tacks' and dig out the reason for the failure and—pay for it!"

Marking Valves When "Grinding-in."

Some repairmen, while grinding-in valves, use red lead mixed with oil for a smear with which to cover lightly the business edge of a valve in order to know when it has been ground to a perfect bearing. The pigment should be mixed very thoroughly and evenly. No lumps or bunches left in the mixture. Then when used a very small amount should be taken on a finger and very thinly spread very evenly over the entire working surface of the valve.

Don't spread the color thick in one place and thin in another, spread it evenly, then place the valve upon its seat and revolve in the usual manner, and spots of red left on the surface indicate low places which need further grinding of the valve in order to bring the rest of the valve surface down to the level of the parts still covered with pigment.

Some repairmen prefer prussian blue mixed with machine oil, instead of red lead and oil. They claim that the blue color is easier seen than the red. Some repair shops use no pigment at all, letting the discolored portion of a valve show when the grinding had not proceeded far enough. But I saw one Ohio garageman work a real cute "kink" in this direction. Instead of bothering with a dirty, sloppy, spilly paint, of any color, this chap simply carried a very soft black lead pencil in his pocket and used that instead of paint. He rubbed the pencil lead evenly over the valve, and then ground all the lead off, and that was all there was to the operation.

FILLING CYLINDER SCORES.

For a Few Cents the Automobile Owner Can Put Back the Pressure in Compression and So Restore the Power of His Engine.

By AN OLD SALESMAN.

WHEN I was in the automobile business I had occasion to dispose of used cars in various stages of disrepair, and like many other used-car dealers (and horse salesmen, by the way) I was inclined to "doctor" my goods so that the machine would work at its best while it was being demonstrated.

Now do not make a mistake and think that all dealers in used cars try to swindle their customers by misrepresenting the cars which they are selling, for they do not. I was one of the exceptions who did try to dispose of cars under the old maxim of "Let the buyer beware." This is not intended as a confession, but as a suggestion for the readers of the AUTOMOBILE DEALER AND REPAIRER magazine.

Scored cylinders and poor compression are two of the things that always bother me most. The average automobile owner or would-be purchaser knows that an

Digitized by Google

engine with a poor compression indicates a car that has little power, and he is right, but he little realizes what good compression represents in dollars and cents.

To restore the compression to normal by ordinary repair methods usually means a cost of from $25 to $75, depending entirely upon the engine and the condition of the cylinders, and if the dealer cares to dispose of a car at a reasonable profit he is not in the humor to spend this amount. He is forced to cut the price of the car greatly or take some other means for restoring the compression.

Let me whisper one word in your ear, "graphite." I see by your expression that your mind is still blank, yet I have given you the full recipe for saving at least $25 in most cases. Let me explain more fully. We will assume that your engine has been damaged by having its cylinders scored. Three of the cylinders are in good condition. The fourth, however, has little compression. Its action is uneven and its power greatly impaired. If you understand my little article, immediately you discover this fact you will start the engine and slowly feed into the carburetor a few teaspoonfuls of flake graphite.

After you have done this, you will let the engine run for a few minutes until the excess graphite has been driven through the manifold, then you will remove all of the spark plugs and clean them thoroughly with gasoline. As soon as you replace them you will find that the lost compression has been found. Probably the score has been filled by the little particles of graphite and it is very possible that the score will remain filled for many weeks at a time. The cost has been less than one cent and the repair has occupied possibly half an hour of your time, yet you have an engine of four cylinders rather than a bunch of iron that has only three working units.

SHARPENING THE SCREWDRIVER.

By CHAS. E. DURYEA.

EVERYONE knows how to sharpen a screwdriver, of course. This well-known tool is so common that every mechanic considers it perfected and never gives it a thought, while others give it no attention at all. The result is that too often it resembles a cold chisel rather than a device to fit screw heads and turn them.

Assuming that whatever is, is right, does not speed progress. A much better way is to adopt the rule that whatever is, may be the best there is, but can almost certainly be improved. If anyone doubts this, let him look back ten years in memory to the things he thought perfected then. He will find many of them discarded now.

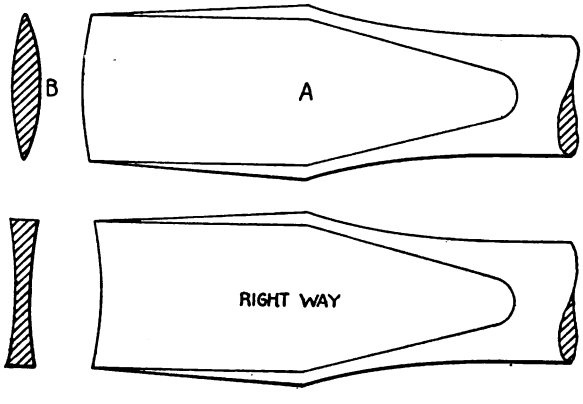

Fig. 1.—Correct and Incorrect Screw-Driver Shapes.

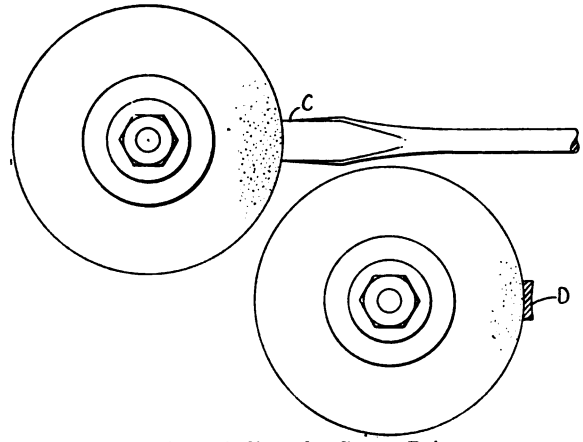

Fig. 2.—Grinding the Screw-Driver.

The following method of grinding screwdrivers must be evident to many, but I have never found it used in but one shop besides those under my influence. It is simply to hollow grind, and a hollow-ground screwdriver is as much better for screw turning than the flat kind as a hollow-ground razor is better than a case knife for shaving.

The screwdriver wears in use at the corners until it gets a curved point, as at A, Figure 1, and a cross-section, B, near the end looks like a section of a simple magnifying lens. Evidently one should grind away the metal where it does not wear away and leave it where the wear comes.

This is easily done by holding the blade in the plane of the wheel instead of in the plane of the axis, and extended radially, as at C, Figure 2, when grinding the end, and when grinding the flats to hold it parallel to the wheel (as at D) spindle instead of tangental to the wheel.

The result is a driver that will hold, in screws, to the limit. It will not split screw heads, for it has no wedging effect. It will drive round or button-head screws without marring them, and it goes to the bottom and gets a full grip in the notch. Once use such a driver and one is not likely to ever prefer the usual shape.

If you like this magazine and feel that it is useful and interesting, the *one best way* to show your appreciation, is to purchase your accessories and supplies so far as possible from our advertisers. Also write to our advertisers for catalogs, printed matter and prices, not forgetting to always mention the fact that you saw the advertisement in the Automobile Dealer and Repairer.

Letters From Red Blooded Americans

While Our Boys Are in France, Driving Out the Murderers, Our Manufacturers Are Furnishing the Money and Material.

AMERICA has finished what she started nineteen months ago and has shown that God *is* with those nations who have enlisted upon the side of Humanity and Justice. She has *won* the good fight because she has remained UNITED. She did not win only because of the soldiers, solely because of the workers, because of much money, or just because of the supporters at home—but because *all* of these units worked as one.

We mourn those who died in battle; we revere our boys, who have fought so well, and we respect those thousands of willing workers without whose help we would have been unable to win.

America will never forget the fighters; you and I, brother reader, will never cease to honor the brave men who put on khaki and crossed the ocean; but how soon will we forget the manufacturer, who came forward in our hour of need, put his shoulder to the wheel and devoted, yes, perhaps ruined, his business in order that the hun might be conquered?

Are we so ungrateful that we will desert our countrymen? Are our hearts so filled with the greed for money that we will turn our backs to the products of our own loyal manufacturers and seek those goods made by men who only a few days ago were our enemies?

You, brother reader, can give the answer to these questions. Perhaps you have answered them already in your own heart. If you are a loyal American you need no argument, you will not heed the soft and wily words of the enemy, when he tries to ingratiate himself and his blood-stained goods into your heart and your homes. Let the words "Made in Germany" be written in Blood upon your brain; they are written in blood and ruins on the soil of France, on tortured Belgium and even in germany itself.

Are you a Patriot or a Traitor?

Below we give portions of letters received by us in response to an appeal, "What have you done, Mr. Manufacturer, to help win the war?" We pass the answer along to our subscribers. Read how they have helped YOU, then read what the huns have done, on the next page, then think it all over.

Barnes Drill Company.

"We are running 100% in behalf of 'Liberty and World Democracy.' In other words, our output of high-class, all geared drilling and tapping machines and extension gap lathes are being built and sold exclusively for essential purposes, and deliveries made on Priority Classification basis."

Curtis Pneumatic Machinery Company.

"We are giving preference, of course, to Government work and to calls from essential industries."

Crescent Machine Company.

"The entire output of our factory is going for Government and essential uses."

Anti-Borax Compound Company.

"We are filling large orders for welding and brazing compounds from our Government. We have lost a number of our men who have joined the colors, but are perfectly willing, and are making every sacrifice possible to help make the world safe for democracy."

Hinckley Machine Works.

"Our work in helping Uncle Sam to win consists in making parts for howitzers, and we are working 90% of our time in this line."

Weaver Manufacturing Company.

"Since the United States entered the war various Government cantonments have been using our equipment. Recently we turned over a part of our factory to ordnance work."

United States Air Compressor Co.

"Ninety per cent. of our factory has been turned over to the United States Government, building the air-compressor units to be shipped overseas."

Hudson Motor Specialties Co.

"Some months ago we donated to the Quartermaster's Department, for use in connection with the Ford Ambulance Service abroad, 100 Hudson Crank Case Repair Arms."

Joseph N. Smith & Company.

"Our factory is operating on approximately 80% Government work and our facilities have so far adapted themselves to the manufacture of parts for the Government that we have not had to revamp the factory."

Du Pont Fabrikoid Company.

"We are not permitted to speak of many ways in which the Du Pont Fabrikoid Co. is co-operating with the War Department, but we can say that we have been supplying Fabrikoid as a substitute for leather for upholstery in practically every place where the Government has need of an upholstery material."

The Reflex Ignition Co.

"Our Government orders, which are being done on a sub-contract basis, constitute approximately 60% of our plant, and we are planning to keep more than 50% of our machines on Government work during the period of the war."

WILL YOU BACK UP THOSE WHO HAVE MADE VICTORY POSSIBLE? PROVE IT!

Digitized by Google

Mr. Purchasing Agent It Is Up To You

Are You Going To Buy Goods From Red Blooded Americans or Will You Buy From the Butchers After the War Is Over?

ON the page facing this article our readers will find excerpts taken from letters written by many prominent American manufacturers—manufacturers who, when the hun was doing his best to wreck the world and enslave the nations, put forth their efforts to save America and make sure that justice and right should not be trampled under foot.

To these manufacturers we owe our allegiance. To these men who have devoted their factories to war work we should now show our appreciation, and we can show our appreciation best through our acts, not by words.

You may call the german all the names in the calendar. You will not hurt his feelings one bit. You will not punish him in the least; but, when you begin to affect his commerce and his business, then, my friends, you are using a weapon that *will* punish him.

"Mr. Buyer, this article is addressed particularly to you; and you, Mr. Reader, are the ultimate buyer of goods, therefore it affects you also. In the next ten years you will be called upon to fight a commercial war. Are you going to stand behind our American manufacturers who can put out goods superior to those made by germans, or are you going over to the side of the enemy? Are you going to let your pocketbook rule you? For many of the following quotations we are indebted to an article written by R. F. Soule of the *Hardware Age*.

* * *

"The other night one of Pershing's boys went out into No Man's Land. He did not come back. Three hours later a searching party had been sent out to find him. That boy had been killed and his body hacked to bits. That brave young American was chopped to pieces with german cutlery.—Before the war we bought two million dollars' worth of german pocket cutlery each year.

* * *

"A captured British officer was recently found with his throat cut from ear to ear. This brutal job had been done with a very keen-edged instrument.—Before the war we imported annually half a million dollars' worth of razors from germany.

* * *

"Two Canadian Red Cross nurses outraged, their hands chopped off and their tongues cut out that they may never tell the hideous story of frightful wrongs perpetrated upon them.—Before the war we bought 600,000 dozen shears and scissors from the Central Powers annually.

"A short time ago the Llandovery Castle, a Red Cross hospital ship, was sunk by a german submarine. Its only passengers were doctors and nurses. It was plainly marked, there was no chance of mistaking it for anything but a hospital ship. The germans torpedoed it, took American doctors from their open lifeboats and abused them.—Before the war we imported from the central powers practically every surgical instrument used in America.

* * *

"Imagine a postal card telling that your son had lost his third finger, deliberately cut from his hand that a hun might be possessed of the ring he wore. Imagine a postal that tells of the women and children at Mons who were forced to march on their own soldiers, acting as a screen for german troopers. Read that the fifty who refused were bayoneted.—Read, and calm yourself of the statistics that inform you that before the war we purchased souvenir post cards and lithographs from germany to the amount of nearly two million dollars annually.

* * *

"Music outraged. Raise the curtain of Kultur ever so little, and peek at those villages of France and Belgium occupied by the invaders. Before your ever-widening, horror-struck eyes is an unearthly panorama of encouraged lust. Villages burning everywhere, the streets strewn with the viciously flung bodies of the helpless inhabitants. From a house before you come the terrified shrieks of a young girl who is being outraged. Suddenly the door of this house is burst open and an old man is hurled into the street. It is the grandfather of the girl whose screams make your blood run cold. He is seventy-five years of age, and has gone to her rescue. As the forcefully impelled body of that courageous old gentleman strikes on the cobblestones, the crowd of half-drunk soldiers, on whose belts you see inscribed "Gott is with us," begin jumping with fiendish glee upon him. Their heavy, hob-nailed marching boots quickly reduce his frail old body to a battered, bloody mass.

"No, Mr. American, these are not hallucinations of your own imagining. They are actual sights made hideously clear by burning buildings which are being wantonly destroyed. Then you see a load of straw on a quaint two-wheeled cart coming down the street. It is stopped. Oil is thrown over it, and in its highly inflammable state the willing hands of the huns throw it into a cellar where a large number of women and children have taken refuge. And then, merciful God, a laughing

DO YOU WANT TO FURNISH MONEY FOR A FUTURE WAR AGAINST AMERICA?

Digitized by Google

soldier of Wilhelm, the Brute of Berlin, scratches a german-made match and one more absolutely inhuman atrocity has blotched the historical page of a couple of nations whose thin veneer of civilization has been scraped away in a war that is but a few days old. Where? Well, the name of the town was Charleroi.

"And from up the street came the sound of outraged music from stolen gramophones, accordions and a pianola. The officers were singing. A musical entertainment in celebration of a victory.

"Before the war, musical instruments, gramophone motors, player pianos; yes, we bought a lot of them from these twin nations of rapine. After the war? In the name of the angels who sing saddened music in heaven as they look down upon music outraged, no more musical instruments from germany and austria.

* * *

"In a recent speech John Kendrick Bangs said: 'I want to tell you what the hun is doing, tell what kind of an enemy we are up against at the end of four years. Six weeks ago I held on my knee a seven-year-old lad who was playing in a village that had not been bombarded. Then the huns dropped a bomb from the aeroplanes and killed some of the old men and women in his town. After they had passed the child was allowed to run out and play. On the road he found a toy. One of these toys we used to get at our children's parties with fancy caps and verses in them.

" 'He took it up as he was intended to do; he thought it was a toy, as it was intended that he should; then he tried to break it apart, as was also intended that he should do. Five hours later, when that little fellow regained consciousness, there was only one finger left on his hand. All the rest had been blown to pieces.' "

* * *

Mr. Buyer and Mr. Automobile Owner, who is really the ultimate buyer of all products, despite these damning facts, are you going to purchase german-made articles? Can you buy a german toy without thinking about that little boy? Think of your own boy mutilated in that same way. Is it pleasant? Is it worth while?

Can you go home and eat food prepared in german-made enamel ware without recalling the atrocities committed upon the Belgium housewives and their daughters?

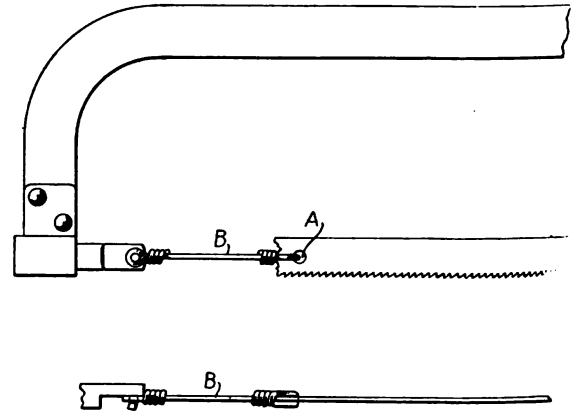
Can you go to a dentist and let him work upon your teeth without thinking of the prisoners whose blood has been poisoned and their bodies mutilated by german-made instruments?

Can you wear a suit of clothes dyed with german dye without thinking of the black spot which germany has left upon the face of Europe?

Can you write your name on a post card without seeing the hun's red splotched hands upon it, and stamped "made in germany?"

Before this war germany said that she could make dyes, instruments, tools, clothing and thousands of other products better than the American manufacturer.

Her truth could be proven from America's import list. She said that she could make WAR better than anyone else. *We have proven her wrong.*



Let us continue our proof and show that Americans can manufacture and produce all products better than germany. Let us prove that we as Americans cannot only fight better but live better than germany.

We backed up our war with our pocketbooks. That is why we succeeded. Do the same by our true and red-blooded American manufacturers who have stood by us in this fight. They have helped you and me, Mr. Reader, to win the war. Let us show our appreciation by helping them in the war that is to come.

USING OLD BROKEN HACK SAWS.

By CHAS. E. DURYEA.

IN these days of high costs and scarce material one should not throw away good stuff. If the end breaks from a new hack saw, as in the figure, make a hole, A, near the break and use in a shortened frame or splice

How to Utilize Old Hack-Saw Blades.

with a loop of wire, B. Do not spoil a drill trying to make the hole. Hold the end of the saw in the fire until it is red, prick deeply, and file or grind off the raised spot. This produces a hole which can be enlarged easily by reaming with the sharpened point of a small file. Clock springs can usually be perforated by the prick-punch and file method without softening.

Always use handles on files. Handles are cheaper than the same length of file. The handle enables the workman to work faster, easier and better. Longer strokes are taken and the file is worn the whole length. The worn-out file can be thrown away at the proper time instead of being saved because "some inches near the tang are still good." Corn cobs make fair handles if nothing better is at hand.

THE TRANSMISSION GEAR-SET.

Changing Gears From Low to High Is an Easy Matter, but Few Drivers Can Change From High to Low With a Minimum Amount of Grind and Clatter.

By F. L. PHILLIPS.

I WONDER how many automobilists know how to change gears noiselessly? Stand on the corner some day and listen to the automobiles as they pass. Be sure to pick out the corner where the car must be slowed to a few miles an hour and the gears changed, and you will find that six out of every ten drivers make the change with as much noise as a steam roller running over a pile of crushed rock. They slam in the gears, speed up the engine and change gears into high with a crash.

At every change there is a great amount of gear noise, and this noise is not always due to the fact that the gears are worn, but usually because the driver does not know how to make the change properly. In the average sliding gear transmission of today there are two shafts, a main shaft and a counter shaft. The main shaft is made in two portions. The forward section connects directly to the clutch and is usually a large driving gear.

The rear section of shaft is fitted with two sliding gears, both of which are keyed to the shaft and drive the rear axle directly. The counter shaft is fitted with four or more gears, one of which is meshed with the driving gear and the rest are all keyed tightly to the shaft. As long as the clutch is in and the driving gear rotates, this counter shaft rotates with it and the counter shaft ceases to rotate only when the clutch is thrown out.

The sliding gears and the other three gears on the counter shaft are of various sizes and are designed in such a way as to offer various gear ratios for selection. Let us see what happens when a car is started.

With the engine running, the two sliding gears on the main shaft are at neutral—that is, neither of them mesh with the counter shaft gears. These sliding gears are stationary because the car is not moving, but the counter shaft gears are traveling at a certain rate, depending upon the speed of the engine. If either of the sliding gears were to be meshed with its corresponding counter shaft gear the teeth would be stripped from either or both of the gears, so the clutch must be thrown out, and when this is done the counter shaft ceases to revolve, then the low-speed sliding gear can be meshed with a gear on the counter shaft. In this ratio the gear on the counter shaft is smaller than the one that meshes with it.

The clutch is then thrown in, the counter shaft starts to revolve and drives the main shaft, thereby moving the car forward at low speed. When sufficient headway is attained it is desirable to change this low speed ratio for a lower ratio—that is, the low speed ratio gear must be slipped out of mesh with its counter shaft gear and the intermediate sliding gear meshed with its corresponding counter shaft gear.

As before, this operation cannot occur without damage to the transmission until the clutch has been released. As soon as the clutch is released the counter shaft is carried along by the speed of the car through the sliding gear, then the low sliding gear is slipped out of mesh. As soon as this occurs the counter shaft loses speed and it is time to mesh the intermediate speed.

Now the intermediate speed gear on the counter shaft is only slightly smaller than its corresponding gear on the main shaft. Therefore it can be meshed just as soon as the counter shaft speed slows to the speed of the main shaft. Since the tendency of the counter shaft is to slow down, its change can be made with but little noise. After intermediate speed has been attained the clutch is thrown out, and this same intermediate gear is moved forward, only it locks with the other portion of the main shaft or the driving gear. As before, the change can be made with a minimum amount of noise, for the reason that the driving gear has a tendency to lose speed and conform to the speed of the main shaft, which drives the wheels.

Few car owners fail to make the changes from low to high without an appreciable amount of noise. The real trouble comes when the driver desires to change from high to intermediate, or from intermediate to low speed, and the reason for this is, that when the car is running at high speed the driving gear is running at main shaft speed.

As soon as the clutch is thrown out the main driving gear loses speed, and if the intermediate gear is thrown in, a grinding noise results, because the intermediate gear ratio requires a faster counter shaft speed that is being developed.

In changing from high to intermediate, or to low, means must be adopted to speed the main driving gear and counter shaft at a higher rate than it would travel ordinarily. To make this change noiselessly the operator should throw out his clutch, change the gears to neutral and speed up the engine, let in the clutch for a second until the counter shaft has attained a high speed. Throw out the clutch again and mesh the intermediate gears.

In changing from intermediate to low, the same procedure must be gone through. Always bear in mind that only a second is required to bring the speed of the driving gear up as high as required. A tap with the foot upon the accelerator is usually sufficient. Do not, however, forget to throw out the clutch again, before meshing the gears.

F. R. WHITTEN, Advertising Manager — H. F. LUDINGTON, Western Representative

GEO. A. SMITH, Eastern Representative
FRANKLIN MYERS, Art and Copy Dept.

TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage $1.00
One Copy, Six Months ..... 60 cents
Single Number ..... 10 cents
Except in zones 7 and 8, comprising the following States: Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wyoming. In all these the rate is $2.00 per year, made necessary by the unjust increase on the part of Congress in second class Postage.
Foreign Subscriptions ..... $1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order, or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES SUPPLIED ON APPLICATION.

The Automobile Dealer and Repairer in New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in New Zealand for obtaining new subscriptions.

MISSING NUMBERS—Our readers are requested to remember that we are always pleased to re-send numbers which have gone astray in the mails.

Victorious Peace.

JUST as we go to press the news comes in that an armistice has been signed and that the great world war is over.

Ordinary words fail to express the jubilation justly caused by such a momentous event, the most important one in the history of all mankind.

The world has indeed been made safe for Democracy and Freedom, and in the immortal words of Abraham Lincoln it is decreed that "A Government of the people, by the people and for the people shall not perish from the earth."

This Christmas Number of our magazine is doubly appropriate, as we usher in a new era of "Peace on earth, good will toward men."

We do not need to wish our readers a Happy Christmas, as this should be the happiest Christmas this war-scarred world has ever known.

Prosperity and Plenty Are Promised For Next Year, Get Your Share of Business

FOR nearly a year now the manufacture of passenger cars has been cut from 25% to 75%. The normal sale of these vehicles has dropped necessarily a corresponding amount. The man who ordinarily has made a point of purchasing a new car from year to year has been forced to content himself with his old machine. It stands to reason therefore that during 1919 there will be a phenomenal sale of new cars.

The manufacturers in 1919 will find themselves face to face with the demands of two years rather than the possible demands for one year. There will come a great demand for automobiles both new and second-hand, a greater demand than ever before for this reason. It is a period of great prosperity. Never before has the working man been able to spend so much money. His first thought is an automobile. An automobile seems to be in the minds of every American a necessary possession as soon as he has money enough to purchase one. As a matter of fact there are many possessors of machines who do not have money enough to own them.

The prosperity which awaits the manufacturer, also holds out many promises for both the dealer and the repair man. More cars mean more work, and more sales. Every dealer should prepare himself for the coming golden future, plan as never before, and radiate the spirit of optimism.

The war is over and with it our worries as far as selling is concerned. What before was only a bud, bids fair to blossom the coming year, the seed is "the automobile" and the blossom "big business."

Why Not Plan to Have the Automobile Shows, if Possible, Early Next Year?

SOME few months ago the automobile world was agitated by the announcement that the automobile shows which ordinarily were held at Chicago, Boston and New York were not to take place this year. The automobile world realized that this was a war-conservation-necessity.

Automobile shows are not essential. They are simply a means of disposing of products and manufactured machines, and since the War Industries Board called for the cessation of automobile manufacturing plants, from automobile work, the apparent reason for shows ceased.

Since then, however, conditions have changed. It is true that we are bound to furnish Europe with a certain amount of material but the old saying still holds good that charity begins at home. Naturally we will furnish every product necessary for our Allies' trade reconstruction, but it must be remembered that the Allies can now mine plenty of coal and the Belgium iron fields are open to the European countries.

There will be a tremendous amount of materials re-

Digitized by Google

leased at the cessation of war. At the end of this year or the first of next year, the coal situation will have been cleared up, and although there must not be a waste of materials in any line, the Government will undoubtedly do everything in their power to assist the manufacturers in resuming their old lines of business and putting the various businesses back upon their old basis.

It seems only logical therefore that some move be made for the reinstatement of the automobile shows. Automobilists, dealers and manufacturers should exert their influence toward this end. To the automobile business, an automobile show is not perhaps essential yet it is a great help. It enables the buyer to get in communication with the manufacturer. At the show he can make comparisons and obtain new ideas so essential for up-to-date business.

An automobile show is to the automobile world what a show window is to the dealer. It enables the manufacturer to show his wares and it enables the prospective buyer to get a line of what he needs or wants.

Next year, undoubtedly, will be a year of great prosperity for us. Our year will begin as soon as an automobile dealer has decided upon his line for 1919. The dealer usually begins his plans in January or February. Why not have our automobile shows as usual at this time unless it is found that they interfere with the plans of the Fuel Administrator or the War Industries Board?

To All Subscribers in Zones 7 and 8.

THE unfair and unjust raise in the rates of postage on second class matter, which by act of Congress went into effect July 1st, forces us to announce a raise in the subscription price of the AUTOMOBILE DEALER AND REPAIRER in zones 7 and 8 to $2.00 per year. These two zones comprise the following states: Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington and Wyoming.

Our readers located in these distant zones may naturally feel some degree of resentment that their states have been discriminated against by Congress in this manner, thereby compelling publishers for self-protection to raise subscription rates.

We understand that many Representatives in Congress located in these far distant states voted in favor of the Zone system or in other words of imposing a heavy tax upon their constituents. All subscribers located in these zones should communicate with their Congressmen and demand that this act be repealed.

In all other zones than those mentioned above the subscription rate on the AUTOMOBILE DEALER AND REPAIRER will remain, for the present at least, $1.00 a year, as heretofore.

The Insidious Work of the hun Should Not Be Permitted After Peace Is Made

AMERICA has only lately awakened to the gigantic scheme of german propaganda, which has spread over this country like a monster net. So insidious has been the work of the hun that too great a percentage of American industries have been directly dependent upon germany for their goods or products. Such a mistake must not be repeated.

We must never allow ourselves to pay germany an indemnity in the shape of trade. Buy American products, purchase English materials or invest your money in goods from France or other countries, but do not let any of your money get into german hands.

Do not allow germany to "put her finger in your pie," for sooner or later that finger will stir it up and your business will cease to be American. It will be german controlled. You cannot put your hands around the neck of the kaiser, but you can throttle german industry in America. America is for pure, hearty Americans. It is the only country in the world where freedom is absolute.

You had your answer when you came to America, when you freed your feet from the soil of your foreign country you became an American. As soon as you accepted American money you became indebted to America. You owe America your allegiance and it is your business to protect American interests. After this war is over and we have stamped out the hun, let us all work together and push American goods to every corner of the earth. Let us make America a star among nations and spread our propaganda into every country so that even the boys in germany will wish that they were Americans.

In "Those Good Old Days" of Long Ago of Which the Old Timers Speak

THOSE who are compelled to pay the exorbitant prices charged now for meats of all kinds will be interested to know what meat cost seventy-five or eighty years ago.

The editor and publisher of this journal recently came across a bill for meat which was delivered to his father, Thomas Richardson, in 1832. One item is 6 lbs. veal at 4 cents—24 cents; another item is 5 lbs. beef at 6 cents —30 cents; 4¾ lbs. pork at 10 cents—48 cents.

In those good old times it did not cost so much to live as it does now, but perhaps the people of those days had just about as much trouble paying their bills because wages were low and hours long, and money not easy to get hold of.

The writer remembers when carpenters and other mechanics worked twelve hours a day and thought nothing of it. It was the regular thing.

The High Tension Ignition Coil

The Average Owner Knows Little About the Common Induction Coil, Yet This Is a Very Important Unit.

BY GEO. W. MUENCH

IN over five years' experience teaching gas engineering I have found nothing more perplexing and less understood than the induction coil, unless it be the high tension magneto. This would, however, be natural, for not to

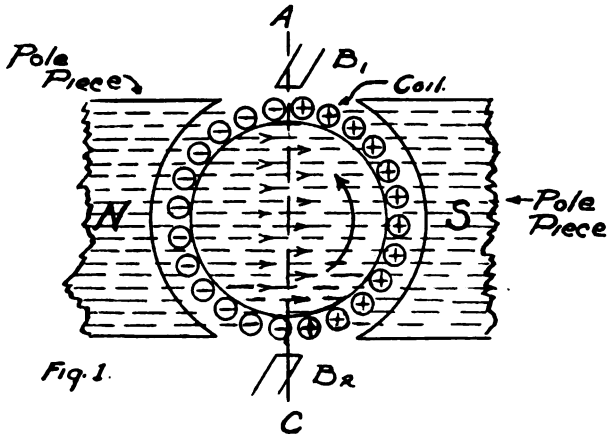

Fig. 1.

understand the induction coil means not to understand the magneto. It is of course necessary to understand the mechanical method of producing an electric current, as well as a few principles of magnetism.

Most gas engine operators are familiar with ordinary horseshoe magnets and they no doubt know that magnets have two so-called poles, called north pole and south pole. The magnetic lines of force travel from the north pole to the south pole as shown in Fig. 1. If a coil of wire now be moved so that it cuts the lines of force an electric current will be generated in the coil. This is the one mechanical method of producing an electric current.

If an electric current is passed through a wire the wire itself will be surrounded by a magnetic field. Now if this magnetic field be moved so as to cut a coil of wire, or the coil moved to cut the field, an electric current will be produced in the wire. This is the second method of mechanically producing an electric current.

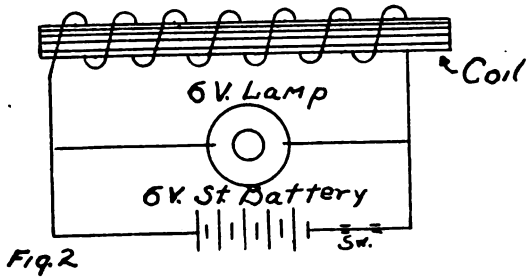

Fig. 2

In the induction coil all the above principles are made use of, only in a manner not so easily seen. It should be understood also that steel becomes only a fairly strong magnet, but retains its magnetism for a long time, whereas softer iron becomes a much stronger magnet, but loses it as soon as the magnetizing current stops.

It is this production of the magnetic field and its sudden collapse that does the work in an induction coil. If a six-volt lamp and six-volt battery be connected across a coil as shown in diagram No. 2 and the switch closed, the lamp will burn at normal brightness; but if now the

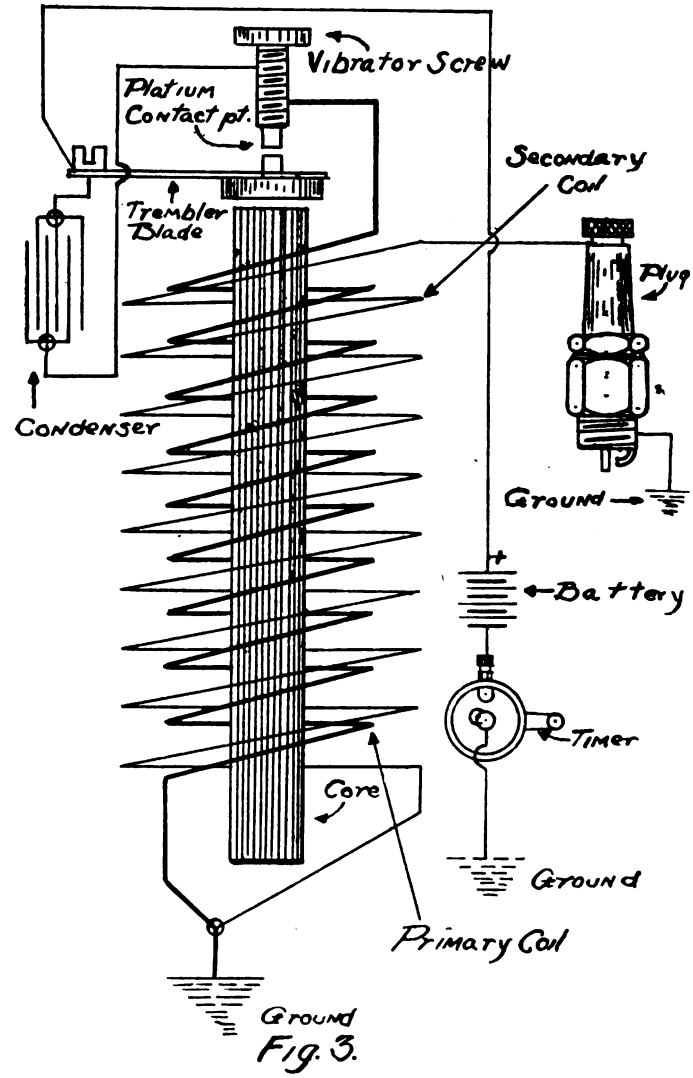

Fig. 3.

switch is suddenly opened the lamp will suddenly flare up. This is due to a new current being produced in the coil when the collapse of the magnetism, due to the opening of the switch, cuts the turns of wire of the coil.

This peculiarity is called induction. Now let us assume another coil in the vicinity of the first one; at the time of the collapse of the magnetic field this second coil would have an electric current produced in it as well as

Digitized by Google

the one which at first carried the battery current. However, the pressure (voltage) of an electric current thus induced in coils varies with the number of turns, so by giving this second coil thousands of turns of wire a high voltage can be induced in it.

Fig. 3 shows the complete construction of a single cylinder induction coil with a battery connected to explain operation. The iron core first has wound over it a few turns of fairly heavy wire. This is called the primary winding. Over this is another coil of thousands of turns of extremely fine wire. This is the secondary. At one end of the core is placed a spring with a piece of soft iron fastened onto it, as shown in figure. Above this and part of the spring blade is one contact point. The other point is stationary. Now if the switch (which is the timer in a gas engine ignition circuit) is closed, current will flow from the battery through the vibrator points, through the primary winding and back to the battery. The iron core now becomes a magnet. This attracts the piece of soft iron and it is pulled down.

This action separates the vibrator points and breaks

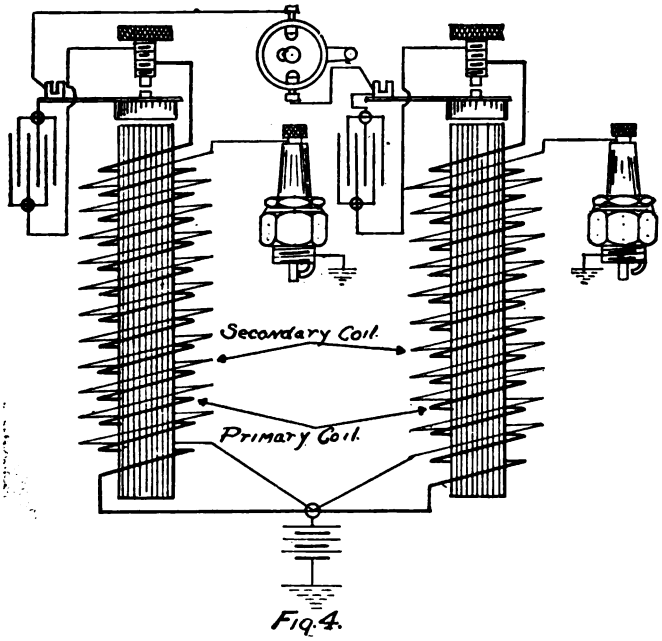

Fig. 4.

the battery current. This causes the collapse of the magnetic field, which causes the magnetic lines to cut the secondary winding and produce in it a new electric pressure, which because of the great number of turns in the secondary is strong enough to jump the air gap shown. As soon, however, as the battery current ceases flowing through the primary the iron core refuses to attract the piece of soft iron, since it loses its magnetism. The spring now again closes the points and now the same operation is repeated.

During the collapse of the magnetic field a flow of current is also produced in the primary winding. This induced voltage would have a tendency to reduce the effect of the secondary voltage by causing the core to try to retain its magnetism and therefore produce too slow a demagnetizing of the core. This current would also cause sparking at the vibrator points. This is prevented by the condenser.

The Condenser.

The condenser not only prevents this sparking at points but also intensifies the spark at the air gap. It is con-

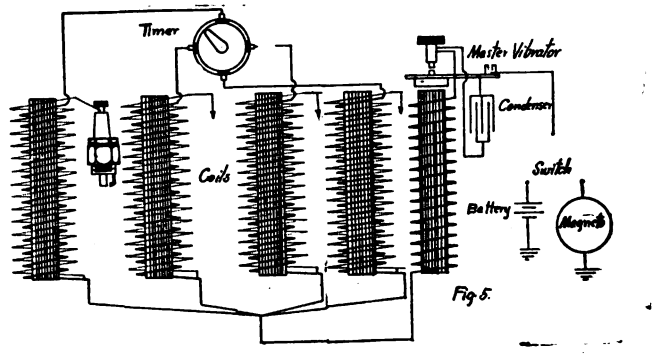

Fig. 5.

nected as shown. It consists of leaves of tinfoil separated by waxed paper. The alternate layers of tinfoil are connected together for one terminal. The other ends are connected for the other terminal.

In wiring an ignition system on a gas engine the metal of the engine often is used as a wire. This grounding is made use of in both the primary and secondary windings, and because of this one binding part can be eliminated. Fig. 4 is a complete internal and external wiring diagram of two coils for a two cylinder jump spark system. In

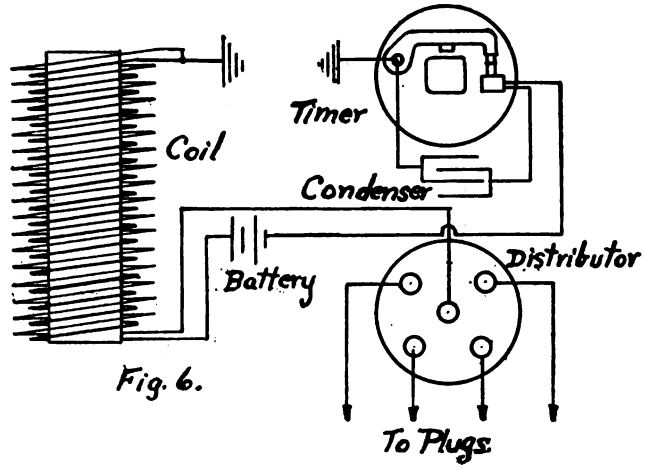

Fig. 6.

these multicylinder vibrating systems it is common to have a coil for each cylinder, but often one vibrator takes the place of all the others. This is accomplished by means of a master vibrator.

A master vibrator is no induction coil. It is a coil of only one winding. Its object is to operate the vibrator for every cylinder, but it does not produce the spark. Fig. 5 shows a complete four-cylinder system with a master vibrator. Notice that it has but one winding and that it is so connected that it is in the circuit of each coil, depending on where the timer has the circuit closed.

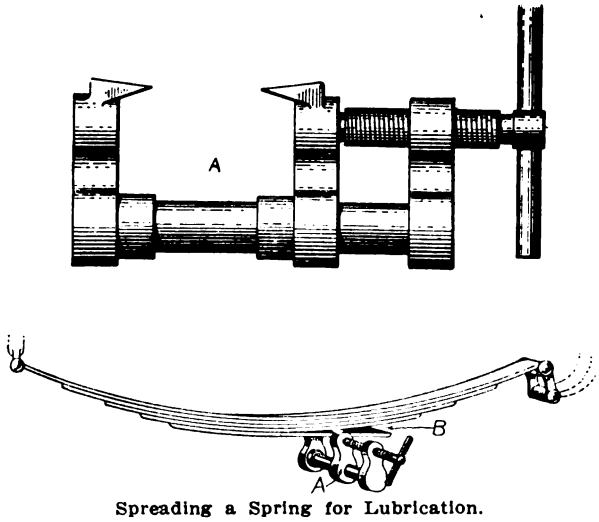
Another type of induction coil is the non-vibrating

Digitized by Google

coil. Remember that in the vibrating coil the spark was actually produced by the collapse of the magnetic field due to the opening of the primary circuit which is accomplished by the separation of the vibrator points. In the case of a non-vibrating coil this has to, therefore, be taken care of otherwise. This is done by a mechanical device.

Two small metal points are mechanically closed and opened. These points are called the breaker points, or timer points or interrupter points. But since the breaking takes place but once, in this case just a single spark is obtained, instead of a stream of sparks as was the case with the vibrating coil. Fig. 6 shows a modern non-vibrating ignition system. In this system it is necessary to make one other change. In the vibrating system there was one coil for each cylinder. Now only one coil is used, therefore the secondary current must be led to the proper cylinder at the proper time. This is accomplished by a rotating switch called the distributor. This distributor must of course operate at a definite speed with respect to the breaker points, and they in turn must operate at a definite speed with respect to the engine.

Between You and the Rough Highway



Perhaps You Never Have Realized How Important the Springs Are; Read This Article and Find Out.

BY WM. H. STEWART, JR.*

THOUGH you have never realized it, the one thing you desire in a car, above all others, is comfort. Your car may have the most power, consume the least gas and oil, have a shine like a new carriage, yet if it is not comfortable to ride in then it gives you no more pleasure than a wheelbarrow, unless you happen to be one of those amateur mechanics whose greatest joy is to "tinker" on the engine.

I have ridden in cars that looked like "ten thousand dollars" and returned from my trip a mass of bruises, so to speak. My back ached, my head was sore, and my nerves a total wreck. On the other hand, I have journeyed in machines that looked like "thirty cents" and returned refreshed and rested after a few hours of smooth and easy riding.

There is a great difference in cars, and this difference

Spreading a Spring for Lubrication.

is not always expressed in terms of dollars and cents. A penny is larger and heavier than a dime, but it is the material in it that counts.

Whether you own a Ford or a Pierce-Arrow, you can ruin it by inattention, or keep it in condition by a little care; you can make it ride like a steam-roller or with a smoothness similar to that of an airplane.

What the muscles in your body are to you, so are the springs to a car. Did you ever try this experiment? Next time you are in a trolley car, place your head against the frame of the window and notice how you feel every jar and knock of the wheels against the rails. These jars and shocks are absorbed by your body and your head is thus protected. Your muscles are a complex system of shock absorbers, just like the springs of an automobile.

But every muscle and part of your body is lubricated and kept in condition by the blood stream, while no such provision is made in the automobile. This machine requires attention or it will not give satisfaction, so you must learn how and why to give it proper attention.

When the springs on your car were made, the leaves were shaped, tempered, and as a final step they were polished before assembling. Each leaf was made just as smooth as possible and then given a heavy coating of grease, then assembled with the finished spring.

Before we can see the reason for lubrication we must consider how and why springs are made as they are.

Two qualities are essential in a spring. First, resilience, and second, strength. Either of these qualities can be obtained alone in any piece of metal, but to obtain the combination considerable ingenuity is necessary.

It would be an easy matter to make a spring from one solid piece of steel, but the spring would not be resilient. It would be easy to make a thin resilient spring, but it would not have strength. The answer is an easy one—make a spring from many pieces of resilient steel.

Each spring is made of several flat spring units called leaves. Each leaf is free to bend itself, without dependency upon the other parts; but each leaf forms a part

Digitized by Google

and gives its strength until the combined spring has both springiness or resiliency and strength.

Let us suppose that a spring were made of two leaves, though usually five or six leaves are necessary for strength. The bottom leaf, which is termed the "main leaf," is fastened to either the body or the axle. Upon it rests the second leaf, and through the center of the two is passed a bolt, which is fastened to either the axle or the body, if the spring is of the semi-eliptic type.

As weight is placed upon the body the center of the spring is pressed downward, and as it was originally bow-shaped it straightens out. Now bear in mind that the ends of the lowest leaf are fastened firmly to the axle, and so the lowest leaf cannot straighten out as can the upper leaves.

As the weight increases the ends of the upper leaf slide along the next leaf below it, until the pressure is entirely transferred to the lower. No matter how many leaves there are, each leaf slides along the next below, until all assume the same shape, and the whole weight rests upon the lowest leaf.

One can see very easily that it is this sliding action that absorbs the jars and rebound of the car's weight and the road irregularities. This being the case, it is essential that each leaf be so arranged that the leaf above it can slide along its surface. If it is rusty or uneven there is danger that the leaf above it will be broken.

The first thing that one should do upon purchasing a used car is to examine the springs, remove them and give them a good cleaning and polishing. Coat them well with heavy grease or graphite and replace them.

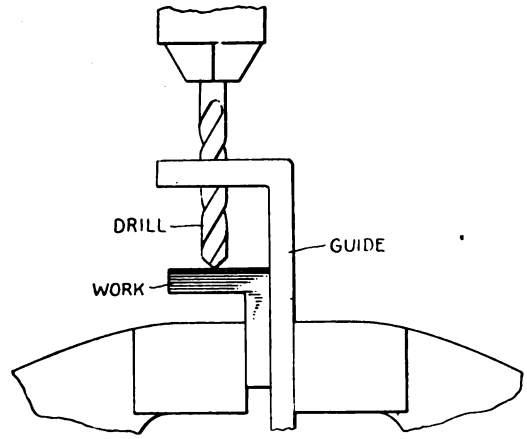
With the springs on the car, if they are in good condition with smooth surfaces, they can be greased very easily. Jack the body up so as to remove all the weight from the springs and then loosen all spring clips.

The ordinary method of inserting a cold chisel by means of a heavy hammer or mallet may be effectual, but should not be tried on one's own car; it often results in bent or broken springs. Try to use one of the special wedges or clamps which are sold for a few cents at the accessory supply station and with it wedge apart the spring leaves.

Don't make the big mistake of wedging the leaves far enough apart to bend them; half an inch apart usually means a spoiled spring. Wedge the leaves just far enough apart so that you can get a thin case knife between them; then apply just as much grease as you can. Take a fine piece of string and thread it between the leaves, and with the string spread the grease all over the spring surfaces. After this has been done, smear on about half a teaspoonful of Dixon's flake graphite and spread it with the string over the grease; then start on another leaf.

When all the leaves have been treated in this way wipe off the surplus grease and the job is done. After you have once treated the springs in this way you need not bother again for a whole season if you are careful to oil them every five or six hundred miles.

Now all of your work will be for nothing if you do not make sure of another little point: oil the spring suspension bolts. One seldom realizes that all of the weight of the whole car rests upon these bolts; inspect them regularly; as soon as they show wear, replace them. Keep them oiled.



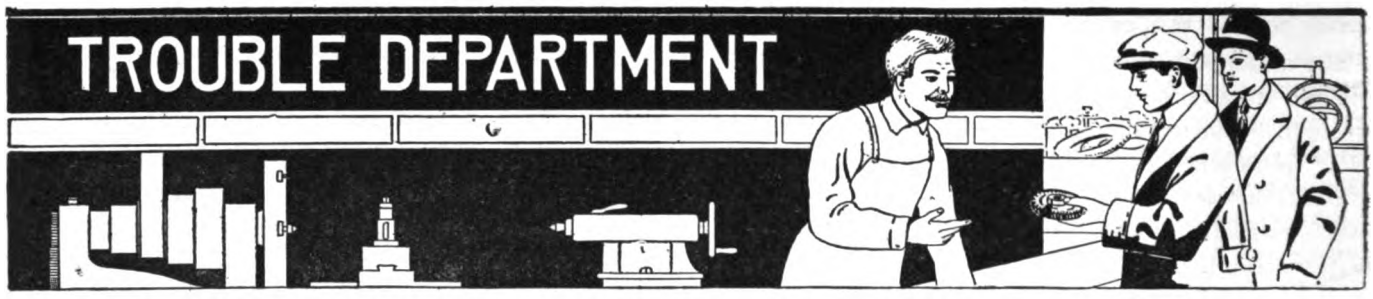
*President Stewart Automobile School.

A GUIDE FOR A SMALL DRILL.

By CHAS. E. DURYEA.

DRILLING a small hole by hand power is not easy, not because of the pressure required, but because of the care needed to avoid breaking the drill. Care requires time, and drills are hard to get. Both should be conserved. The drill guide is a simple device that obviates the need for care and so permits greater speed and pressure, and this is true whether hand drill, bow drill, breast drill or bit brace is used.

Its principle is a modification of the well-known fact



Guiding a Small Drill.

that a sewing needle can be driven through a copper cent if it is first driven into a cork. The cork prevents the needle from bending under the blow and breaking. Small nails, which would otherwise bend and require boring a hole for them first, can be driven safely in the same manner.

The guide is formed of a piece of steel having in one end a hole, and so shaped that this hole may be held above the work. Usually the guide and the work are gripped in the vise together and the guide can be slipped down as the hole gets deeper. Or the guide can be bent so as to permit clamping to the work. It need not be very stiff and so can be bent easily to fit other jobs. The hole need not fit the drill closely, but must prevent the drill from swinging off to one side far enough to be damaged—for no matter how steady one's nerves, it is not easy to avoid "wabbling" the drill. The effect of the guide is much that of having a very short drill.

2530 Squeaks in Wheel Bolts.

From C. W. Walden, Tennessee—Will you kindly answer through the "Trouble Department" how I can stop the squeak of the lug bolts and wheel rims? I have tried every remedy I know.

Reply: Remove the bolts and the clamps from the wheel and give both the bolts and the notches a coating of graphite mixed with oil. You can mix this yourself by placing a few teaspoonfuls of flake graphite in a dish and moistening it with just enough cylinder oil to form a thick paste. It is very possible that the squeak comes from loose spokes. In any event, should you find this to be the case, or should you find that the graphite does not work satisfactorily, mix up a solution as follows:

Place a half pint of gasoline in a tin and place the tin into boiling water. The water should be brought to a boil and taken from the open fire else there will be danger of an explosion. The boiling water will warm the gasoline and to the gasoline add as much paraffin as the gasoline will dissolve. Upon cooling this solution will harden, and to prevent this add about four teaspoonfuls of gasoline while the mixture is still hot. You can easily pour the mixture down the spokes in the wheel or dip all of the bolts and fittings into it. The gasoline will evaporate and leave a thin surface of paraffin.

2531 The Ford Magneto.

From I. D. Bush, North Dakota—I have an old 1910 Ford car which I have just fitted with a new cylinder block. While I had the machine apart I put in a set of new magnets and coils. I thought that with the new magnets I could get more current and so run the ignition and lights.

I used the greatest of care in putting the magneto together but it will not give sufficient current unless the engine is run at high speed, and I cannot start it without batteries.

When the lights are switched on, the engine stops immediately, if it is being run upon the magneto. The dealer from whom I purchased the magnets, kept them in a pile, corded together, seemingly with no arrangement. I don't even know how long he had them in his store. Would that make any difference If the magnets were drained of their strength would it account for my trouble?

Reply:—The magneto on a 1910 Ford was not designed for heavy work, but if you replace the magneto properly, for a time at least, you should be able to obtain sufficient current to operate both the ignition system and the lights.

If the agent piled the magnets indiscriminately you should not have purchased them without giving them a test. Each magnet should separate a weight equivalent to that of the cam shaft timing gear.

When installing the magnets, the north poles of the two adjacent magnets should be together. The distance between the steel magnet poles and the spools should be approximately the thickness of a visiting card. You can arrange the steel magnets in the proper order if you remember that like poles repel each other and unlike poles attract. It does not matter which is north and south so long as you get two north poles together and two south poles together.

2532 Questions On Dodge Brothers Car.

From Walter Jordan, Nebraska.—Will you please answer the following questions, all of which relate to a 1917 Dodge Brothers car.

Will too lean a mixture cause the engine to overheat?

What is the cause and remedy of whistling carbon brushes in the generator?

What is the cause and remedy of a green substance that forms on the positive battery terminal?

Will any damage result from this green deposit?

What is the cause and remedy of grease working out at the brake bands?

How are valves removed?

How can I tell if there is a leakage around the valve stems?

If the water in the storage battery evaporates slowly is it a sign of a fully charged battery?

If the specific gravity of one cell is lower than that of another, would it be policy to remove some of the stronger solution and put it in the weaker?

Reply:—A lean mixture will not cause the engine to heat. The two main causes for heating are wrongly timed valves and retarded spark. The exhaust valve should not close until after the piston has passed top center. The spark should be set so that when the engine is started it occurs at about ¼ of an inch on the flywheel after top center and can be advanced the whole range of the quadrant. It should be advanced as far as possible without causing the engine to labor or knock.

The whistling carbon brushes on the generator are caused by lack of lubrication or improper fitting. The surface of the brush should conform to the curve of the commutator. The commutator should be kept lubricated

Digitized by Google

by dipping the finger in vaseline, wiping off the surface and touching the finger against the commutator. There should be just enough vaseline on the commutator to leave a thin surface, but not enough to be noticeable.

If the mica extends above the surface of the commutator, the brushes will not work smoothly. The mica should be kept down below the surface slightly.

The corrosion forming on the battery terminals is due to acid action on the lead. You can prevent this by cleaning off the oxide and coating the terminal over with vaseline. The only damage that this corrosion will do is to make for poor connections.

The only way to prevent the grease from getting on the brake bands is to substitute a heavy felt washer on each side of the differential housing bearing. Evidently your felt washer is not heavy enough. Put in another if there is room or substitute with a new one if there is not room for two others.

To remove the valves all you will need to do is to lift the valve spring and valve spring retaining washer with a valve lifter. Then pull out the spring retaining key. The valve can then be lifted out. Worn valve stems or valve stem guides can be detected by starting the engine, and while it is operating, squirt some gasoline around the valve stems; if the engine action alters it evidences that the gasoline is drawn past the stems.

If the water in the storage battery evaporates fast it indicates overcharge or leakage. If the water is slow to evaporate it means that the battery is kept in fairly good condition. The specific gravity of all cells should be approximately the same. The solution should not be removed from one cell and placed in another. Only a battery man can bring the electrolyte to the proper specific gravity.

Oil Pump Out of Order.

2533

From W. B. Campbell, Illinois.—I have a 1916 Baby Grand Chevrolet on which the oil pump fails to function properly. It has been balky at intervals all summer and will not pump the oil into the dash sight. Formerly it worked almost too well, it pumped too much oil and did not run out of the sight as fast as it ran in.

Last week the pump failed entirely. I took off the cover from it and noticed that though the cogs or gears turned all right, there seemed to be considerable play in them. I should think that by racing the engine I would be able to get some flow of oil.

Reply:—Your trouble is probably due to the end play in the oil pump gears as you suggest, but before replacing these gears we should advise you to try the machine after you have primed the pump. Are you sure that the pipe leading from the pump to the base of the engine or the passageway leading through the strainer is clean?

Be sure that everything is clean before you replace the gears. A gear pump of this type, once it gets dry, is apt to stop functioning. You can prime it by filling it with oil and it should then start. Of course if the gear pump does not work at low engine speeds, it will make no difference whether the engine is raced or not. The gear pump is positive, that is, it should pump oil at any engine speed.

Scraping Sound in Ford.

2534

From S. Lloyd, New York.—I have a 1917 Ford car which has developed a scraping sound when running down hill or idling. This noise seems to be growing louder as time goes on.

The engine also lacks power when running at low speeds and will not pick up on a grade. Recently it has troubled me by overheating. The local repairmen cannot seem to locate the troubles.

Reply:—The scraping noise of which you complain probably arises from trouble in the clutch, the magneto, or the gear-set. The only way to find out just where the trouble is, will be to disassemble the gear-set and find what member is pressing against either the cones or the flywheel. There are so many possibilities that we could hardly cover them in two pages of the magazine. The reasons for lack of power are as follows, any or all of which may be your troubles. Check off the points we mention, and if you do not find the trouble let us hear from you later:

> Carbon in cylinders; leaking valves; loss of compression; leaks around valve stems; poor ignition system; the spark is not advanced far enough; valves improperly timed; too rich a mixture; faulty ignition coils.

The spark should be timed so that it will occur with the spark fully retarded just after the piston has started on the down stroke. The exhaust valve should close at dead top center. Your ignition coils should give a spark at least ¼ of an inch in length. The clearance between the valve stems and the tappets should be approximately 1/64 of an inch and not more than 1/32. All of the manifold line should be tight. Adjust the carburetor for the leanest possible mixture.

Grinding Valves.

2535

From D. C. Gairing, Pennsylvania.—Will you kindly tell me how to grind valves, what to use for grinding, how the valves should look and about how long a time is required for the work.

I followed the timing as instructed in the Ford instruction book and found that the distance between the push rod and valve stem varies in the several valves. What would cause that? I cannot seem to adjust them properly.

Reply:—For grinding valves you can obtain a specially prepared valve grinding paste at any automobile supply house. This paste comes in two or three grades, fine, medium and coarse. If the valves are badly pitted you should use the coarse grade and grind all of the valves until it is evident that all parts of the face are being ground. Then use a fine grade and continue to grind the valves until the surface is smooth and has somewhat

Digitized by Google

the appearance of a piece of fine ground glass. (You can see what ground glass looks like by inspecting the finder on any camera.)

The valves are considered well ground when they can be dropped into place and oil poured in on top without leaking past them. Be careful not to get the grinding paste into the cylinders or into the valve stem guides.

In grinding valves do not turn them completely around. Turn them back and forth about one-quarter of a revolution. After four or five movements, turn them forward one-half a revolution, then back and forth one-quarter of a revolution again, then forward one-half a revolution and so on until every part of the valve has been ground against every part of its seat. To get good results you should spend at least half an hour on each valve. A repair man can do it in less time, but he is experienced.

After the valves have been ground they should all be dropped into place and the valve clearance between the valve stem and the tappet adjusted. In order to get this clearance correct for each valve, turn the engine over until the tappet has risen and dropped back into place again. Then turn the fly-wheel one-half a revolution more. Then adjust the valve clearance so that it is not more than 1/32 of an inch and not less than 1/64. All valve clearances should be the same.

After the valve clearance has been adjusted time them so that the exhaust valve in number one cylinder will open when the piston reaches a point 5/16 of an inch before bottom center. To verify this setting turn engine over and see that the exhaust valve closes at top center or shortly after top center.

If the valves are not adjusted properly the engine will overheat. Your trouble with the valve stem adjustment and timing arose probably from the fact that the engine was incorrectly timed or the valve clearance in all of the cylinders was not properly adjusted to start with.

2536 Retiming An Old Oakland Car.

From E. H. Buckingham, Nevada.—As I am 50 miles from the nearest repair shop I would like some advice from you relative to my old, four cylinder, Oakland car, Model 42, year 1913.

This machine is equipped with an Eisemann high tension magneto which has an automatic spark advance. A short time ago the front connecting rod broke loose and about wrecked the machine. I replaced the broken parts and as I had taken off the gears and replaced them with new, I cannot tell how to set the timing of either the valves or the magneto.

Will you kindly tell me how to time the valves and the magneto and how to find the proper firing order?

Reply:—The first thing that you must do is to time the valves properly and as we have no records in this office showing just the proper position for this old model car, we will be obliged to give you general direction and let you find by experiment just the proper setting.

First, turn the crankshaft until the piston in number one cylinder is at the top of its stroke. As you turn the crank shaft notice the direction in which the cam shaft turns. With the piston at the dead top center, turn the cam shaft in its direction of rotation until the exhaust valve in number one cylinder has opened and closed. You can determine this by placing a piece of paper between the valve stem and the tappet, and as soon as you can release this piece of paper mesh the gears. This setting is merely made as a trial.

Turn the crank shaft over one full stroke and the piston will be at the top of its compression stroke. Note the position of the crank and turn it forward 135 degrees. If the exhaust valve starts to open before you have turned the engine 135 degrees, remove the cam shaft gear and reset the cam shaft so that the exhaust valve will start to open at 135 degrees past the top of the compression stroke.

This 135 degrees is equivalent to 45 degrees before bottom dead center. On the average engine the exhaust valve opens between 40 and 45 degrees before bottom center and 10 degrees past top center.

Your engine, however, being of the older type, may require a different valve setting and it is very possible that the exhaust valve opens later than at 135 degrees past the top of the compression stroke. At any rate it should not close before dead center under any considerations.

After you have set the valves, turn the engine over again until the piston in number one cylinder is at the top of the compression stroke.

In any four cycle gasoline engine there are two upward strokes of the piston, the exhaust and the compression strokes. In the exhaust stroke, the exhaust valve will be open to allow the dead gas to escape. In the compression stroke both valves will be closed. There are two downward strokes, intake and power strokes. Upon the intake stroke the intake valve is opened. Upon the power stroke both valves are closed and as we said before, the exhaust valve opens between forty-five degrees and bottom center of the power stroke. The strokes occur in the following order:

Down, intake; up, compression; down, power; up, exhaust, etc.

With the spark fully retarded, set the piston in number one cylinder at the top of its compression stroke, then turn the flywheel one-half inch further around in its direction of rotation. The piston will then be starting on its downward power stroke. Then turn the magneto armature in its direction of rotation until the points in the breaker box start to separate. They will be together but as soon as the engine turns the slightest the points should begin to separate. At this point the gears should mesh.

Then remove the distributor cover and notice under which distributor connection the brush is located. Connect this terminal with number one cylinder. Then turn the engine over and watch the distributor brush to see what direction it runs. Beginning with number one connection, connect the balance of the secondary wires with the distributor points in their firing order.

To find the firing order open the compression cups or remove the spark plugs. Turn the engine over until air

Digitized by Google

is forced by the compression stroke through the spark plug hole or the compression cup in number one cylinder. Then put your hand over number two and three cylinders and see from which cylinder the air is being forced. If it is from number two cylinder then the firing order is 1-2-4-3. If the air is forced from number three cylinder it is 1-3-4-2.

To make sure of this turn the engine over until the exhaust valve in number one cylinder starts to open. Then watch the exhaust valves in cylinders number two and three. The exhaust valve in number two cylinder will open next in order if the firing order is 1-2-4-3. If, however, the firing order is 1-3-4-2, the exhaust valves will open in that same order.

A Clogged Radiator.

2537

From J. A. Frentress, Iowa.—I have an Overland car, model 90, and am bothered by the engine overheating. I live about three miles from town and cannot make the trip at the rate of 25 miles per hour without overheating the engine. Repairmen have spent some time on it but as yet have not remedied the trouble; can you make any suggestions?

Reply.—Your trouble is probably due to the fact that there are deposits in the cooling system. Mix up a strong solution of potash lye and water, and after removing the water from the system pour in this potash lye, being careful to strain it through a cloth. One can of potash lye should be used with enough water to fill the radiator.

Run the engine until the solution has been thoroughly warmed, then let it stand for a half hour, then drain the potash lye from the cooling system and turn the hose into the top of the radiator while the engine is running.

If the engine overheats after this treatment, do the same thing with a strong washing soda solution. If you still experience trouble clean all of the engine motor passages with a flexible iron wire, then apply the potash or soda solution again.

Removing Storage Battery.

2538

From J. Ashei, Oregon.—I have a 1916 Oakland Six, model 32-B car that is equipped with a Deaco lighting and starting system. I would like to know if there is any way to operate the car without the storage battery, using the generator for lights and ignition. Is there danger of damaging the generator?

Reply.—Whether or not you can use your car without the storage battery without damaging the generator is a matter of experiment, and we would not advise you to continue it for any length of time.

For the first hour or so of running you will need to watch the generator rather closely, so that you will not burn it out. After having removed the battery connect the wire which leads from the starting switch originally to the positive battery terminal with a headlight bulb of the size which you are using in the headlights, and connect the other terminal of the light with the frame.

This light should give you enough resistance so that there will be no danger of burning out the generator, but you should examine the generator every two or three minutes for the first half hour, and be sure that it is not overheating. If it overheats, stop the engine and install another storage battery which you will be able to hire from any service battery station. If you are on the road at the time, disconnect the wires leading to the brushes in the generator to prevent that unit from burning out.

If you are able to use the light in place of the storage battery without overheating the generator, you must realize that the headlights and the lighting system will only become operative after the generator has reached a speed corresponding to from 12 to 15 miles car speed.

Long Stroke Engines.

2539

From F. J. Huper, Nebraska.—Will you tell me if a long stroke engine has more power than a short stroke engine? For instance: which has the most power, an engine having a bore of 4¾ inches and a stroke of 6 inches or one with a 4¾ inch bore and a 3 inch stroke?

If the stroke has anything to do with the power, why does not the S. A. E. or A. L. A. M. formula take the stroke into consideration?

Reply.—The horsepower of an engine is dependent directly upon three things: the size of the combustion chamber, the piston travel and the number of cylinders.

The A. L. A. M. formula for figuring the horsepower says, multiply the bore by itself, then by the number of cylinders and divide by 2½. This formula is correct only when the piston is traveling at the rate of 1,000 feet per minute. If, for instance, you had an engine having a 6 inch stroke and the flywheel were traveling 1,000 revolutions per minute, the piston would travel 1,000 feet per minute, and the formula would be correct. If the stroke were shorter than this and the engine ran at the same speed, it would not develop as much horsepower. For instance, compare two engines both having 4¾ inch bore. The first has a 6 inch stroke. The second has a 3 inch stroke, both run at 1,000 turns a minute.

Although the S. A. E. formula would show them as developing the same horsepower, the one having the 6 inch stroke would develop, theoretically, twice as much horsepower. If, however, the short stroke engine were operated at 2,000 turns a minute, it would develop the same amount of power. As a matter of practice the shorter the stroke the higher speed can the engine be run. Therefore the S. A. E. formula applies to the average engine.

Digitized by Google

2540 Filling Dry Batteries.

From P. E. Steves, Wisconsin.—Will you kindly tell me how I can refill the type of dry cells that are used for ignition and telephone work?

Reply.—A dry battery cannot be refilled unless the zinc casing is in good condition, and the results are always questionable. In some cases you can refill a battery and it will last longer than it would originally; in other cases nothing you can do will put the battery in operation again. Still, the experiment is always worth the trouble; at least in the writer's estimation, especially now that dry batteries cost so much.

In the first place, punch a row of holes about half an inch apart around the battery slightly above the center. Do not get these holes too close together. They should be punched with a heavy nail, and be slightly more than ⅛ inch in diameter. About one inch below this row of holes, punch a similar set, but stagger them. If there is room, punch a third row. Do not punch any in the bottom or the top, however.

Secure a jar large enough to contain the battery, and fill this jar about half full of a strong mixture of sal-ammoniac. Then put the battery in the jar and let it soak over night. The liquid should not come more than half an inch above the top row of holes, or there will be danger of destroying the battery. After the battery has stood over night in the solution remove it, and after wiping it dry slip it back into its pasteboard case.

Note.—The sal-ammoniac of which we spoke is a white powder which is commonly used for recharging ordinary wet batteries. Any druggist will know what it is.

2541 Electrical Questions.

From H. M. Wineberg, Pennsylvania.—Will you tell me how many kilowatts would be used on a direct current line in 30 hours of time? That is supposing the line voltage is 250 and 2 amperes are flowing steadily all the time.

Is the frame of a Ford car positive once out of every cycle of the alternating current?

How does the high tension circuit on a Ford car return to the coil? The coil has only three terminals.

Reply.—You would use 15 kilowatt hours of current on a 250 volt line in thirty hours if two amperes flow continually. You arrive at this by multiplying the volts by the amperes. This gives you the watts and if you multiply the watts by the number of hours it will give you the number of watt hours, which is 15,000. One thousand watts are equal to one kilowatt and as you have 15,000 watts, you will have 15 kilowatts in thirty hours.

The frame of a Ford car is positive once out of every cycle of the alternating current fluctuation. For every revolution of the flywheel there are sixteen changes in the direction of the current. Therefore if the engine is running at a rate of 1,000 turns a minute the frame will be positive 16,000 times every minute, and negative as many times per minute.

The word "cycle" primarily means the completion of a series of events.

The high tension circuit on a Ford car grounds through the timer and one side of the primary coil and through the magneto or batteries on the other side of the primary coil. The only time that the high tension coil is in action is while the timer roller is in contact with one terminal of the primary winding. Through this terminal the primary winding is practically grounded and offers no resistance to the high tension current. The high tension coil is connected to the primary winding of the coil inside the coil box.

2542 Batteries and High Tension Magneto.

From E. F. C., New York.—If a car is equipped with a high tension magneto and it does not supply sufficient current to start the engine, can dry or storage batteries be attached in such a way as to build up the magneto current?

I have a Maxwell touring car, 1914 model, and the engine tends to overheat, even when idling. I have ground the valves, installed a new fan, advanced the timing. Will an engine overheat because of advanced timing? What do you think is the trouble? I might add that the engine pulls excellently and does not knock.

Reply.—We cannot recommend the use of dry batteries with a true high tension magneto. The only type of magneto that we care to recommend for use with batteries is of the dual type and this machine utilizes a secondary coil for the batteries. Where batteries are used with a high tension type there is danger that the permanent magnets will be demagnetized.

Overheating in your engine cannot be due to a spark advanced too far. An engine will not overheat for this reason alone. A retarded spark is one of the things that causes it to overheat. Your trouble is probably due to deposits in the water jacket, in the engine itself or possibly because the gaskets which you use have not been punched through at the proper places and do not allow full circulation. Are you sure that the pump is functioning properly?

We should advise you immediately to mix a strong solution of potash lye and water, fill the radiating system with it and run the engine for about five minutes. Let it stand for a few minutes, then run the engine again until the mixture is heated. Draw off the mixture and flush the whole system well with clean water. Replace all of the hose connections with new ones. If the engine still overheats put back the old hose connections and mix up a strong solution of washing soda and water. Use this in the same manner as the potash solution. In both cases be sure to strain the solutions through cheesecloth, to remove the dirt, lumps, etc.

If after having cleaned the cooling system in this manner, the engine still overheats, let us know.

Of course you understand that the first thing you must

Digitized by Google

do is remove the head and be sure that the gaskets are punched in the proper places and then scrape out all of the sediment in the water jackets with a long flexible wire.

Engine Will Not Idle.

2543

From Andrew Jenkins, Ohio.—I have a Buick truck, model D4, which has been giving me trouble for about three months. I have had the carbon removed, the valves ground, ignition system tested and carburetor replaced with a new one (Rayfield), yet the engine will not throttle to an idling speed without backfiring and stopping.

It pulls satisfactorily and runs fine at speeds above 15 miles per hour, but below that it jerks and runs unevenly.

Reply.—Very evidently all of your trouble is due to the fact that there is a leakage around the valve stems which permits the engine to take too much air at low speeds. As the car speeds up, however, this excess air is just enough to keep it running smoothly.

With your engine running at normal speed, take a squirt can filled with gasoline and squirt a slight amount of gasoline around all of the valve stems or in openings into the combustion or intake line. If the engine action changes with the application of gasoline it evidences a leakage at that point.

Let us know the results if you cannot locate the trouble.

Overcharging a Battery.

2544

From R. Kanogawa, Washington.—Will you kindly tell me if there is any device which prevents the overcharging of the battery in the present car? How many kinds of current regulators are in general use? Will you please explain about the third brush regulation? How is the size and capacity of a magneto determined?

Reply.—We know of no device which automatically prevents the overcharge of a battery, in use at the present time. The only thing that really answers the purpose is what is termed a "touring switch" by which the operator can cut off the battery from the charging unit when going on a long tour.

Many machines, however, are so arranged that the charging rate is extremely low and a battery is not overcharged to any great extent if the lights are used during the evening once or twice a week.

At the present time the following systems of regulations are used: third brush; reverse series, magnetic resistance relay, thermo regulator. In brief the third brush method of regulation is as follows:

The third brush ordinarily is spaced about one-third the way between the two regular brushes. Assuming that it is nearest to the negative brush the current for exciting the fields is taken from the positive brush through the fields to the third brush. With the dynamo running at normal speed the fields build up to their maximum.

As the armature speed increases, there is a distortion of the fields in the direction of armature rotation. Under ordinary conditions the voltage drop between the regular brushes we will assume to be six volts. Then the voltage difference between the positive and the third brush will be, we will assume, 5½ volts. As the lines of force in the field system are distorted the voltage in the fields drops and the output of current is not as great, dependent entirely upon the position of the third brush.

If the third brush is moved in the direction of rotation of the armature nearest to the negative brush or the brush from which it is one-third distance away, then the voltage output of the generator will be increased.

If the third brush is moved back against the direction of rotation and nearer midway between the two brushes, the voltage output will be decreased.

We do not quite understand what you mean by the size and capacity of a magneto. The capacity of a generator is determined by the number of volts and amperes which it furnishes at its normal running speed.

For instance, if a generator furnished six volts and twenty amperes, it would furnish 6 by 20 or 120 watts. Seven hundred and forty-six watts equals one horsepower, therefore 120 watts would be approximately one-sixth of a horsepower.

Ford Car Compression.

2545

From S. E. Miller, Mississippi.—I have a 1913 Ford car in the engine of which I have recently installed a set of new rings, scraped all bearings, ground the valves and given it a good overhauling.

There is a light knock in the engine at all times that I cannot locate. Some days it is very evident, other days almost gone. After the engine is heated there is hardly any compression and I can spin it easily. The pressure or compression is 40 pounds, what should it be?

Can you tell me what brass and aluminum are worth per pound? Would you advise me to purchase a 1910 ——— car? This machine will cost me but $30. Do you think I can make anything out of it?

Reply.—The compression in this engine should be between 50 and 60 pounds. Evidently the cylinders are scored or the rings do not fit properly. We should advise you to make sure that the cylinders are in good condition. If not have them reground or rebored and then fit the machine with a set of leak-proof rings. Before you do this, however, examine the valve clearance.

If the engine is heated, the distance between the valve stems and the valve tappets should be approximately 1/64 of an inch. Possibly your trouble is due to the fact that this clearance is not great enough. As soon as the engine heats one of the valves is held open at all times.

The tapping noise which you hear may be due also to improperly adjusted valve clearance.

We cannot advise you as to the probable value per pound for brass or aluminum for the very reason that this

Digitized by Google

figure varies greatly in different localities. The only way for you to get a reliable figure would be to ask a junk man. The figure which he will give you of course will cover the pure metal. That is, you will be unable to sell a piece of cast iron with a bronze bushing in it at either the figure for junk iron or junk brass. You will be obliged to drive out the bushing before you sell.

The junk value of a 1910 ——— car should not be as high as $30 unless the tires can be used again. Whether is is worth $30 or not to you depends entirely upon what you can use it for. We doubt very much if you can use a 1910 ——— for any practical purpose, as a car. You might be able to repair the engine for use in a launch or you might be able to use some of the parts on another machine, but we doubt if you can ever repair the car at a reasonable figure so that you can ride in it comfortably.

You might be obliged to pay nearly $100 to get it into condition again, and after you have made all of these repairs you would not have a satisfactory machine.

We would advise you to put $100 with the $30 and buy a second-hand Ford car of a later date. We feel that you will be making a mistake in paying even $30 for a 1910 car of this type.

Soldering Ford Radiators.

2546

From "A Friend in Need."—I would like to ask for information regarding repairing of radiators of the Ford type. Is there any way to take out an old tube and put a new one in its place? This seems impossible to me for the reason that all of the cross fins are soldered to each tube.

Now if one cannot remove the tube, how can it be repaired? There are a number of them in a row, one behind the other. It is easy enough to get at the first row, but how about the third or fourth tube?

Is there any kind of acid besides muriatic that can be used to clean the tubes?

Reply.—There are two ways in which radiators of the Ford type are repaired. In the first place if the leak is small and near the front, four or five of the cross fins are removed with a small hacksaw or cold chisel, taking special care not to damage the rest of the tubes. This leaves room to reach the tube and solder it from the outside. An expert radiator repair man frequently can spread the fins apart and by using a long thin-pointed soldering iron, repair the front row of the tubes.

The second method entails the removal of the upper back part of the upper tank and the lower part of the lower tank, thus exposing the ends of all the tubes. The broken tube is then plugged up both at the top and at the bottom, or if a smaller tube is obtainable which can be slipped into the damaged tube, it is cut off one-quarter of an inch longer, slipped into place, expanded at both ends and soldered.

No matter what process you use for soldering, the job is a big one. In many cases the tinsmith will not bother to undertake it at all.

We do not know of any battery soldering fluid other than muriatic acid cut with zinc. The acid will clean any surface if properly used. For ordinary purposes you might keep two grades of this acid mixed. One differs from the other in that it contains about 5% pure acid. To mix the acid proceed as follows:

Obtain the ordinary commercial acid and dilute it with about 30% with water. Put into it as much zinc as it will dissolve. Let it stand about two days, shaking it occasionally. Then strain it through cloth and divide it into two portions. The first portion can be labeled "soldering fluid—non-acid."

Into the second solution put about 5% commercial acid. Label this "cleaning acid." In this way you will have a slight acid action to the second portion and you can use this for removing grease or dirt. Of course in every case you must clean the part thoroughly after having used the acid or it will destroy the metal.

Magneto on Single Cylinder Engine.

2547

From W. O., Massachusetts.—I have a single cylinder kerosene engine fitted with a jump spark coil system which is now operated by four dry batteries. I have a Bosch four-cylinder magneto, model 5. Is there any way to use this magneto for ignition on the single cylinder engine? What speed must I drive the magneto? Can I use a belt for the purpose?

Reply.—You should have no trouble in operating a single cylinder engine on a four cylinder Bosch magneto. The magneto should run at crankshaft speed, that is, the gear on the crankshaft should be the same size as the gear on the armature of the magneto. Do not use a belt.

To time the magneto proceed as follows: Turn the engine over until the piston has reached the top of its stroke, then move the flywheel in its proper direction of rotation one-quarter of an inch. Note which direction the armature of the magneto turns. Remove the magneto gear and turn the armature until the breaker points begin to separate. By this we mean that the breaker points will be together, but if the armature is turned the slightest the breaker points will begin to separate.

At this point mesh the gears. Then remove the cover of the distributor and note under which distributor connection the brush is located. Connect this secondary connnetion with the spark plug. The next secondary wire on the distributor should be connected on the ground. The third distributor wire should be connected with the plug and the last connected with the ground. That is, connect each alternating terminal with the plug.

Digitized by Google

Metz Car Overheats.

2548

From Chas. R. Thompson, Colorado.—I have a Metz 1914 car which I have recently overhauled. Why does the water have a tendency to boil excessively under moderate engine speeds? Would this boiling be caused by the precipitation of a non-leak solution applied in too excessive a quantity? If this is the case, how can I remove the solution?

Reply.—If you have used any non-leak solution in your radiator, it is possible that this solution was mixed improperly and did not contain enough water. Possibly it has filled some of the tubes, and if so, you can remove it in the following way:

Drain all of the water from the system and mix up a solution of potash lye and water, one can of potash added to enough water to fill the radiator.

Strain this mixture through a cheesecloth, to remove all of the lumps and dirt and pour it in the radiator. Be sure that the system is full of the mixture. Start the engine and let it run until it has thoroughly warmed. Let it stand for ten minutes, start the engine again, let it stand for ten minutes, start the engine a third time and while it is still running drain out the solution, and while it is still being drained turn the hose directly into the top of the radiator so as to flush out the whole system.

If you do not have a hose connection at the garage do not drain the solution while the engine is running but fill it with clean water, run the engine until this water is warm, drain it off and flush with clear water until all traces of the potash have been removed.

If you still have trouble from overheating, mix up a strong solution of washing soda and water, one-half pound to enough water to fill the radiator, and use this solution after straining, in the same way that you used the potash lye solution.

If it is possible we should advise you to remove the cylinder head and clean the water passages with a stiff wire as much as possible.

There is another possibility for your trouble, and that is that the spark may be retarded too far. The spark should occur at dead top center of the piston stroke.

If after following these instructions and checking off the spark you are unable to remedy the trouble let us hear from you, and we will advise you further.

Be sure to let us know if you have adjusted the valve clearance properly, removed the carbon and ground the valves.

A Bad Knock.

2549

From C. M. B., New Jersey.—My engine has recently developed a serious knock which I cannot seem to locate, possibly it is in the connecting rods or the camshaft though I have recently tightened the connecting rods. The knock is more evident when the engine is running and the car is still, and often with the throttle opened the knock disappears. I have had a number of garagemen investigate the trouble and they differed as to opinions, one said that it might be the camshaft. If this is the case, how can I fix it? Is there danger of snapping the crankshaft because of a loose connecting rod?

Reply.—From your description of the knock, we are inclined to believe that it is caused by excessive compression or excess carbon. We cannot quite see why the camshaft should cause a knock of this sort. The camshaft knock would be noticeable no matter at what position the spark occurred. We are more inclined to believe that the trouble's in the main bearings or in the connecting rods, but carbon accumulation is the first supposition.

We are afraid that we must ask you to give us more details and answer the following questions: Are the valve clearances properly adjusted? When did you have the valves ground and the carbon removed? At what speed and by what device can you remove the knock entirely, that is, does the knock disappear when the engine is running at extremely low speeds with the spark fully retarded? Does it make any difference whether the engine is heated or running cold? Are you troubled by carbon deposits in the cylinders? Does the engine lack power? And last but not least, what sort of a car is it, the year, make and model? The year is especially important.

There should be no danger of snapping the crankshaft because of a loose connecting rod. There is more danger that the connecting rod will break loose and punch a hole through the base of the engine or otherwise wreck the machine. The crankshaft will withstand more hammering from the side or top than any other part of the whole machine.

In locating a knock and before you write us again, try the following experiment:

Obtain a stick of wood such as the carpenters use for dowelling about a foot in length and as large around as a pencil. Place one end of this between your teeth and press the other against the various parts of the engine. You will find that you can locate fairly accurately the position of the knock, that is, whether it is near the top of the cylinder or at the bottom, whether it is near cylinder number one or cylinder number four, or at the center.

Cleaning an Emery Wheel.

2550

From Cesco Swinney, Missouri.—I have a small emery wheel which is filled with oil which escaped from the bearings and I cannot grind with it. I have tried to clean it with gasoline, but it only made matters worse; how can I clean it?

Is there a substitute for gasoline for cleaning the patch and rubber in vulcanizing or cementing? The gasoline at present is so full of oil that it is hard to make patches stick.

Reply.—The glaze on an emery wheel can be removed with what is termed an emery wheel dresser. This

Digitized by Google

device is a small, rough wheel mounted in a piece of iron which is pressed against the emery wheel while the latter is in motion.

You should be able to borrow an emery wheel dresser from any of your local machine shops, or possibly the nearest garage. If you cannot, it is possible that you may be able to scrape the glaze off by means of a heavy cold chisel. The cold chisel is held against the wheel while the latter is revolving so that the sharp points scrape against the surface. Be very careful or you will split the wheel open if it revolves at very high speed. In using the emery wheel dresser there is no danger.

Instead of using the commercial gasoline for cementing patches on tires we would advise that you obtain a quart of benzine from the drug store. Benzine is practically gasoline, while the present-day gasoline is practically kerosene.

Peroxide of Hydrogen in a Cylinder.

2551

From H. D. Storms, Canada.—On a Franklin car I have installed a device which introduces water into the intake manifold for the purpose of removing and preventing the formation of carbon. Some of the carbon seems to be disappearing. Do you think that hydrogen peroxide could be used to advantage in place of water? Would it damage the engine? I should think that the extra atom of oxygen might assist materially in oxidizing the carbon.

Reply.—We would not recommend the introduction of hydrogen peroxide into the cylinders of a gasoline engine except under a certain condition; and that is just before the long trip. As a matter of fact, however, there is a certain hazard connected with the use of this liquid, and that is, extreme oxidization.

Then again there may possibly be a slight acid reaction when this is used. In any event there is danger of pitting the valves and walls of the clylinder. We have had experience in the use of this liquid and find that although it seems to remove carbon slightly faster than water, the difference is so little that it hardly pays to take the chance.

Rocker Arm Knock.

2552

From G. Black, Arkansas.—I have noticed in my model E-45 Buick car a light knock that does not seem to do any harm but remains at all times no matter whether the spark is advanced or retarded. This knock sounds like the pecking of a tack hammer and I would like to remedy it; can you tell me the probable reason for the knock and how to stop it?

Reply.—The knock of which you complain is probably due to the hammering of the rocker arms against the valve stems or the bush rods against the rocker arms. The only way to prevent this is by adjusting the clearance between the valve stems and the rocker arms closer than at present.

Wait until the engine is heated. Turn it over until the first valve has opened and closed. Turn it one-half a revolution further and adjust the clearance until the distance between the valve stem and the rocker arm is only about the thickness of this piece of paper. Be sure that the engine is thoroughly heated.

If you still have trouble after making this adjustment, let us hear from you again and we will advise you further.

A Poor Device.

2553

From V. T. Sutpher, New Jersey.—In a recent issue of one of the automobile magazines I find the description of a home-made attachment for an engine which attaches to the crankcase and is designed to furnish the carburetor with warm oily vapor. The idea seems novel but I would like to know if you think it practical. Do you think it wise to draw the oil vapor from the crankcase through the carburetor into the engine again?

Reply.—We would not advise you to install this device, for the following reason:

In practically every engine the oil base is at all times filled with a vapor composed of air and oil. This vapor ordinarily is not explosive. If used as suggested in your description, and if this vapor were thrown into the carburetor thence to the engine, you would soon find that the cylinders carbonize very rapidly.

We would advise you to read the October number of the Automobile Dealer and Repairer in which are given a number of suggestions relative to the heating of intake vapor.

Batteries and Dixie Magneto.

2554

From H. D. M., North Carolina.—Will you kindly tell me how to connect a set of dry cells with a Dixie magneto for starting purposes

Reply.—There is no way in which you can connect batteries with the Dixie magneto on your present equipment. You will need an auxiliary vibrator system, type A V S, which is sold by the Splitdorf Electrical Company of Newark, N. J., and designed especially to be used with the Dixie magneto in conjunction with batteries. The device costs but little, and we should advise you to investigate it.

You may write to the Splitdorf Electrical Company at the above address or to 5943 Ellsworth Avenue, Pittsburgh, Pa., or 210 North 13th Street, Philadelphia, Pa. In writing this concern be sure to tell them the model number, stamped on the magneto, as well as the number of cylinders it will be used for.

Digitized by Google

Cooling a Stationary Engine.

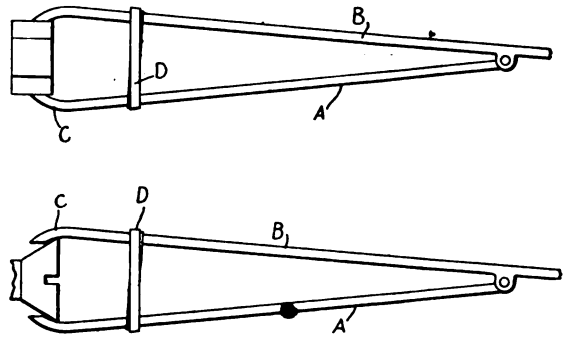
2555

From Charlie Wahl, Colorado.—I have a five horsepower Galloway gasoline stationary engine which I am using to run a feed grinder. The governor is of the hit-and-miss type. Now what puzzles me is, why does the engine require more explosions to keep it going after it has run for awhile than at first when it is cold?

At all times it is pulling the same load, yet the explosions occur much oftener after it has been going for awhile and the water in the system has begun to boil. Why should the water heat so fast? Do you think it is the oil or would you suggest an extra water tank?

Reply.—We should advise you to install a larger water tank or add an extra water tank to the present equipment.

Unless you have had trouble with the burning out of bearings do not change your present lubricating oil. Do not make the mistake in thinking that the heavier oil has more lubricating properties than a light oil. This is not always the case. Your trouble is probably due to the fact that as the engine heats, the cylinders bind the pistons slightly. The only way is to keep the cylinders cooler.



If you like this magazine and feel that it is useful and interesting, the *one best way* to show your appreciation, is to purchase your accessories and supplies so far as possible from our advertisers. Also write to our advertisers for catalogs, printed matter and prices, not forgetting to always mention the fact that you saw the advertisement in the Automobile Dealer and Repairer.

TWO TWEEZER TIPS.

By CHAS. E. DURYEA.

A SLIM cotter pin often can be used as a tweezer. The point can be shaped easily to suit the work at hand. If it needs to be extra good its point may be case-hardened after shaping. It can be sprung to remain closed if it is preferred that way, although to lightly spring open is the usual form.

An old umbrella bow makes a long tweezer, as shown in the sketch herewith, with which screws can be dropped

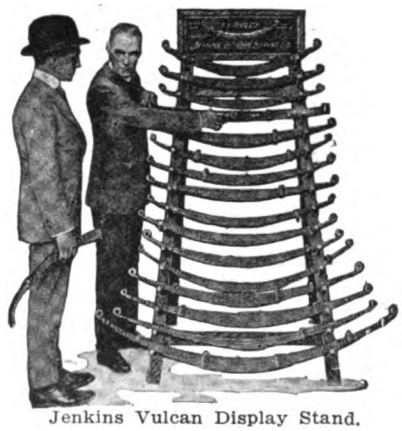
Two Handy Tweezers.

into inaccessible holes or nuts picked out of deep crank and transmission cases. The brace, A, and the short end of the bow, B, are about the same length, and their ends, C, can be shaped to suit by softening them. A rubber band, D, around them will hold them closed on the article and they can be forced apart by inserting a rod between them. The cost for material is nothing and the time required to make it very little.

NEW AND INTERESTING THINGS IN MOTORDOM

Nation Wide Service to Car Owners.

A few years ago it was a very unfortunate thing, indeed, for a car owner to break his spring—it put his car out of commission for a week or more, until he could order one from the manufacturer.



The president of this company conceived the idea of rendering a national service to car owners and dealers by making it possible for every dealer to carry in stock a line of springs for the most popular cars in his vicinity.

The need for a service of this kind was so great that dealers from everywhere responded with orders for springs. Car owners showed their appreciation of the service rendered by Vulcan dealers with increased orders, when in need of other accessories or special services.

So great was the response of dealers that in a few years, instead of one distributing office there are now seven. Under normal conditions each of the seven branches carry a full line of Vulcan springs, ready for immediate shipment to any part of the United States. The company's large factory at Richmond is taxed to its utmost to supply the demands of the trade.

In spite of steel and labor shortage, and the rapidly increasing demand for Vulcan springs, the resources of this company have been such that its dealers have for the most part received the same quick services that have always characterized this business.

By advertising Vulcan springs to the public and trade in periodicals of national

Jenkins Vulcan Display Stand.

circulation, the company has encouraged jobbers and dealers everywhere to carry in stock practically all numbers in the quick selling list. Car owners have seen and heard the expression "Vulcan Springs in Every Town for Every Car." They have responded by moving these springs from the dealers' shelves as fast as they can stock them.

The company provides a spring rack which the dealers can use as a place to keep the springs and at the same time display them to the best advantage. Many of the largest dealers in the country use this rack and assortment of springs as a permanent part of their window display.

The Burke Condenser.

Every automobilist realizes that he must protect his car during the winter from freezing. No matter whether the car is kept in a heated garage or in an unheated one, he must fill the radiator with some sort of a non-freezing solution. Such a non-freezing solution in some cases evaporates and without the owner's knowledge, shortly his non-freezing solution becomes nothing more or less than water, and some fine morning he wakes up to find the radiator a total wreck and the engine jackets cracked because of the ice.

The moral to this story is to protect the freezing solution. Alcohol or kindred fluids when mixed with water make a good anti-freezing solution, but while the engine is

Digitized by Google

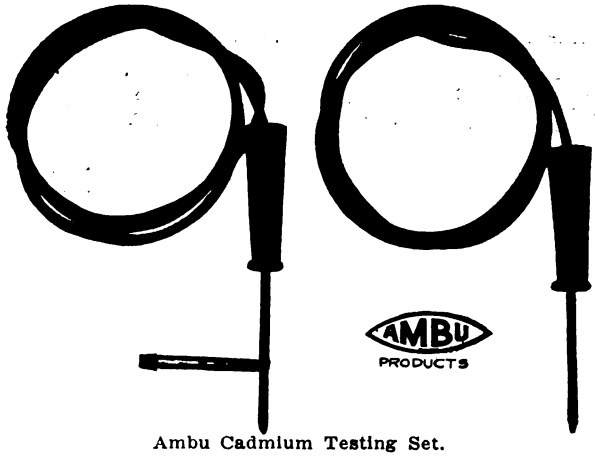
running there is danger that the alcohol will vaporize and be driven away from the water, leaving the water only. A freezing solution protector is sold by the Automobile Devices Company, 2010 Broadway, New York City, or First National Bank Bldg., Chicago, Ill., or Real Estate Trust Bldg., Philadelphia, Pa., and known as the Burke Condenser.

This device is designed to replace the radiator cap in standard types of radiators and consists of a coil and coil of tubing. As the solution is heated and turns to vapor it travels upward into the condenser but the condenser being open to the air, condenses this steam and the steam drops back again to mix with the water once more, therefore little or none of the solution can be dissipated.

Aside from the fact that the Burke Condenser protects the non-freezing solution it also tends to prevent dissipation of the water itself by the same means. Few motorists realize what this means. A thermo-syphon system to be efficient must be kept filled with water, if only a few pints of the water are evaporated, the system becomes inoperative and the engine may be damaged.

The Burke Condenser conserves this water and obviates the necessity for filling the system frequently. There is still another important factor about the device. Constant addition of water, if it contains any impurities at all, means deposits in the radiator and an overheated engine. By condensing the water the Burke condenser obviates the necessity for adding impurities and new water every few hundred miles. Every automoblist should investigate this time-saving device which offers real insurance to the cooling system.

A Difficult Battery Problem Solved.



"Very frequently the voltage or gravity of a battery, or both voltage and gravity, may be satisfactory and yet the battery capacity be very low. This is true because either the positive or negative plates may not be charging or discharging properly, and if either does not completely charge or discharge, then the capacity of the cell can only be equal to the capacity of the faulty plates. Under such conditions the voltage will fall rapidly under discharge and the capacity of the battery will be greatly reduced."

Following this paragraph from the book, "The Automobile Storage Battery, Its Care and Repair," is a detailed description of the test by means of the use of cadmium, that can be made of each set of plates, separately, to determine their condition.

To make this examination and test without tearing down the battery is a problem for which every garage man would like the proper solution.

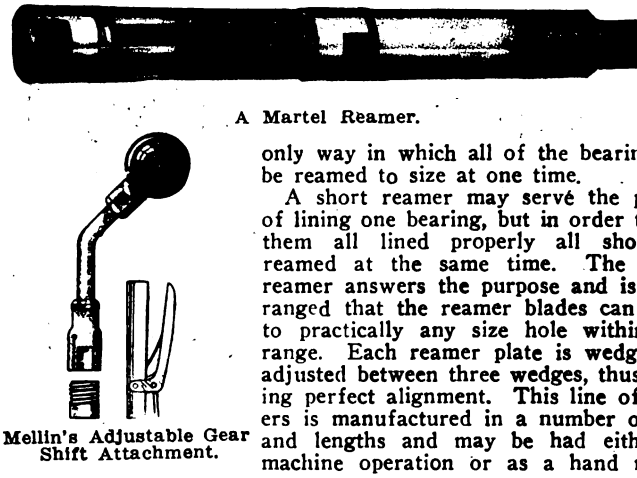
The efficiency of this test has created such a demand for a means of conducting it easily that the American Bureau of Engineering, Chicago, have devised the Cadmium Testing Set, illustrated herewith. It consists of two leads of insulated wires, 5 feet long, attached to two wooden handled brass prods. On one of these prods is attached a piece of cadmium with a rubber tip.

This Ambu Cadmium Test Set can be used either with the Ambu Trouble Shooter or with an ordinary voltmeter if finely calibrated. The set, together with full instructions, is sold for $3 f. o. b., Chicago. The shipping weight is one pound.

Ambu Cadmium Testing Set.

Roller Bearings.

The dealer or garage man who is looking for either Hyatt or Timken Roller Bearings, or New Departure Ball Bearings, should investigate the lines of bearings sold by the Bearings Service Company with general offices at Detroit, Mich., and with branches at twenty-two large cities, and over 750 distributors throughout the country.



These branches and distributors are carefully placed in the various cities and towns in such a way that but a few hours are necessary to fill the orders from practically any part of the country. Each dealer and garage man who reads our magazine should become familiar with the various branches, a list of which is given in the advertising section of this magazine.

A Driving Convenience.

The fact that there is no adjustment possible in the length of the stock gear-shift lever leads to annoyance and inconvenience in the case of drivers possessed of rather short or rather long arms. This is met and overcome by the Mellin's Adjustable Gear-shift Attachment, a short extension piece, adjustable as to angle and length and with a good-sized ball grip.

This is furnished in styles to meet the varied requirement of different makes of cars. For Dodge, Overland 75-90 and Nash the list price is $1.25. For Buick, Reo, Oakland and all cars having removable ball on top of lever, list is $1.50, while for all cars on which the ball grip is cast solid and is not removable a clamp attachment is furnished and the list is $2.

This device has been on the market for three years and has built up extensive sale. The M. & H. Novelty Co., 857 East 24th St., Los Angeles, are manufacturers, distributing through the jobbing trade.

Mellin's Adjustable Gear Shift Attachment.

Neverleak for Radiators.

This is a liquid compound which it is claimed by the manufacturers will positively stop leaks in radiators. It is a free flowing liquid carefully and scientifically compounded and mixes readily with water. It contains no acid, meal, cement or sediment to clog or impair the cooling system.

It is said that it will stop automobile radiator leaks in from 5 to 10 minutes. It makes a permanent repair by forming a coating on the outside of the break, which coating will dry overnight and is not again soluble by heat, cold, water or alcohol. This preparation also tends to prevent rusting and the formation of scales.

Alcohol may be used as an anti-freeze with this Neverleak, with perfect safety, as one will not affect the other, but one should not use anything else except alcohol. If any anti-freeze article other than alcohol has been used, the water must be drained off and the radiator thoroughly flushed and filled with clean water before putting in Radiator Neverleak. This preparation is manufactured by the Buffalo Specialty Co., No. 1 Hudson St., New York, N. Y., from whom it may be obtained or your dealer can get it for you if you ask him.

We understand that this preparation is sold on an absolute guarantee that it will stop leaks as claimed, or the money will be refunded. Send for circular giving full and further details together with prices.

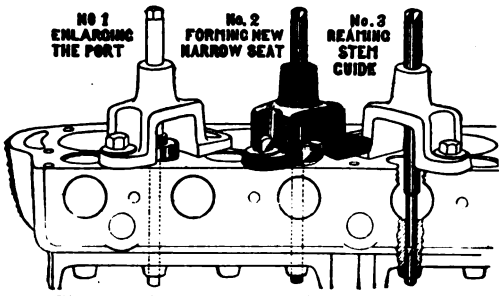
The Martel Reamer.

Anyone who has occasion to repair engine bearings of either the bronze or babbitt type should investigate the Martel Line of reamers manufactured by the Taft Peirce Mfg. Co., Woonsocket, R. I., one of which is illustrated herewith. The reamer illustrated is designed especially for reaming main and crank shaft bearings in an assembled engine. It is practically the only way in which all of the bearings can be reamed to size at one time.

A Martel Reamer.

A short reamer may serve the purpose of lining one bearing, but in order to have them all lined properly all should be reamed at the same time. The Martel reamer answers the purpose and is so arranged that the reamer blades can be set to practically any size hole within their range. Each reamer plate is wedged and adjusted between three wedges, thus insuring perfect alignment. This line of reamers is manufactured in a number of sizes and lengths and may be had either for machine operation or as a hand reamer.

Greblox.



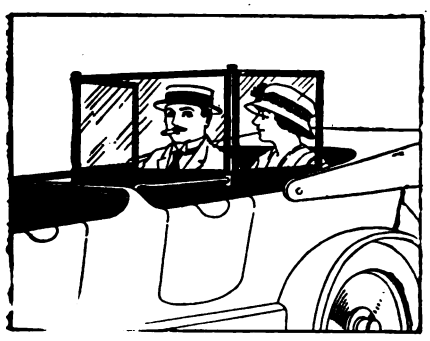
The Greb Company, 197 State St., Boston, Mass., are placing upon the market a product called Greblox; a solder cement which should be in every motorist's tool kit. This cement is a non-conductor of electricity and is said to hold metals, minerals, glass, cloth, wood, paper or practically any material.

It can be used as an insulator in stopping short circuits; it can be used for mending radiators, tools or for repairing tears in upholstery. When thoroughly dry this cement is not affected by chemicals or by water, and is fire-proof.

Digitized by Google

Storm Valve Port Renewing Outfit.

Illustrated herewith is an extremely valuable tool manufactured by the Storm Manufacturing Co. of Thompson, Iowa. This machine is termed the Storm Valve Port Renewing Outfit, and as the name indicates it is a complete valve system renewal. Every automobilist knows that his engine cannot be throttled to a low idling speed if air leaks round the valve stems.



Storm Valve Port Renewing Outfit.

Every owner also knows that he cannot grind the valves satisfactorily if the seats are worn out of round. The device illustrated makes both of these repairs an easy matter. It smoothly reams out the valve stem guide; with another tool in place it enlarges the valve port and forms a narrow seat for the valve similar to that in a new engine.

Fitted with oversized valves the engine block is practically new, as far as the valve system is concerned. Every reader should investigate this appliance. The price is so low that it soon pays for itself in additional power.

The J. H. Tonneau Shield.

We seldom see an automobile on the road today that is not fitted with an ordinary windshield to protect the driver against rain, fog, or snow, yet we often see touring cars driven along the road, the occupants of the rear seat being subjected to wind and dust. Is it not just as important that the rear seats be shielded as the front? A device which may be applied to the back of the front seat is manufactured by the Tonneau Shield Co., Inc., 1779 Broadway, New York City, and termed the J. H. Tonneau Shield.

The J. H. Tonneau Shield In Use.

This device is fastened to the rear of the front seat by means of heavy fittings which enables the occupants to move the shield backward or forward into practically any position, or to drop it behind the seat. For cars that are fitted with a divided front seat, the Tonneau Shield is made in two parts. One part for each front seat. The Shield is handsome and gives an aristocratic appearance to any car.

Beach Rim Tool.

Every owner of a car satisfied with demountable rims knows that there is no fun in expanding or contracting the close split type. The usual method and a very crude one at that is to use a hammer, resulting in permanent damage to the rim, and sooner or later a new rim becomes necessary.

Beach Rim Tool.

The Greb Co., 197 State St., Boston, Mass., has solved the problem by putting on the market the Beach Rim Tool, a device which clamps to both sections of the split rim, and by a movement of the lever contracts or expands the rim, so that the tire can be removed or replaced.

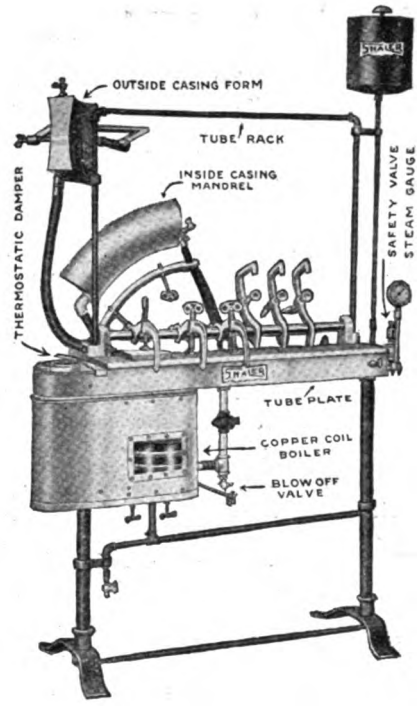
A special proposition is made to jobbers and dealers, and should any of our automobile car owner readers care to try one of these, a ten days' free offer is made.

Important New Motor Books.

Laird & Lee, Inc., Chicago, announce that they have now in press the 1918-1919 edition of "The Modern Motor Car," by Harold P. Manly. It will be issued in one compact volume of 536 pages, large 12mo, with 225 illustrations from detail drawings and photographs and a 24-page alphabetical index, durably bound in flexible keratol, with round corners and colored edges. The revisions and additions bring this standard work up to the very minute, making it a complete, practical and handy reference cyclopedia on all matters connected with the care, repair and upkeep of every type of automobile, old and new.

The same firm have also in hand for immediate publication: "The Farm Tractor—Its Care and Repair," by Wallace B. Blood. This will be uniform in style and size with "The Modern Motor Car," and at the same price, $2.00, postpaid.

The Shaler Vulcanizer.



Everyone in the automobile business admits the possibilities there are for big profits in tire repairing. Many repairmen are getting these profits. Others are postponing their start in tire repairing because they have received the impression somewhere that tire repairing is a mysterious, difficult art to learn or that the necessary equipment is exceedingly expensive.

Right now is the time to give tire repairing serious consideration. The high cost of tires and the possible scarcity of them is filling motorists with a desire to have repair after repair made until the last possible mile of service has been obtained.

One of the types of tire repair equipment that is especially adaptable for the small garage that wants a simple, inexpensive vulcanizing plant, as well as for the repair shop that demands reliability and large capacity is the Shaler Type NPR No. 41, illustrated herewith. There is ample capacity for handling about 200 tubes and a dozen casings daily. Any type of repair that is practicable with any vulcanizer can be handled, from tube punctures to the largest casing blowouts. By the use of the Wrapped Tread Method, adopted from the method used by most tire manufacturers in making tires, the repair of casings is reduced to the simplest terms. And all sizes and kinds of casings are mended with one set of moulds.

Great economy of repair material is secured by the elimination of cutting away and replacing a section of the tire as is often done by repairmen, and at the same time a stronger repair is made than when the tire is weakened by cutting into sound fabric. A 50 per cent saving in time of curing is accomplished by heating the tire from inside and outside at the same time.

This vulcanizer is heated by steam generated by a gas or gasoline burner. One of the outstanding exclusive features which have made it standard throughout the world is the automatic control of temperature by means of a thermostat. It is impossible to overcure or undercure a tire and no attention needs to be given to the vulcanizer while it operates as the temperature cannot vary from the correct degree.

A Shaler Vulcanizer, Type NPR No. 41.

C. A. Shaler Co., Waupun, Wis., also make many other models for repair shop use and a line of motorists' emergency vulcanizers which are among the best selling accessories on the market and are handled by practically every jobber.

Bearing Replacement.

Only a few days ago a subscriber came into the office and asked where he could obtain a new bushing for a certain well-known car; he said that none of those parts could be obtained at any service station in New York and that the factory was slow on deliveries. We asked him why he did not use a cored bar of bronze and make the bushing himself in a few minutes. He did not know that he could obtain such a product.

How many readers have waited weeks for a repair bushing? How many of them

Digitized by Google

realize that they can obtain cored bronze bars, especially made for bushing and bearing purposes?

Yet the Bunting Brass & Bronze Company, 740 Spencer St., Toledo, Ohio, make a specialty of this product. With a little machine work, a cored bronze bar can be made into a perfect bearing, no matter whether the shaft or the casing is worn large or not.

In many cases a stock repair bushing will not fit because of wear in the shaft or housing. Replacement of either the

A Bar of Bunting Bearing Bronze.

shaft or housing means an investment of considerable money, yet a new bushing can be made from cored bars with but little trouble and much less cost.

Every repair man who makes many bearing replacements should investigate this product.

Ball and Roller Bearings.

At the present time when stock parts and bearings are so hard to obtain the car owners and repair men are often unable to replace special bearings in the automobile, and so the car is driven with a worn part which sooner or later damages the other parts of the machine. Anyone who has cause to replace bearings of either the Ball or Roller type should correspond with the Columbus Sales Company, 1777-1779 Broadway, New York, who carry in stock practically all of the standard makes of bearings in any sizes and types. In writing for prices be sure to tell the name of the model of the car, and the part upon which the bearing is to be used.

Standard Motor-Pep.

How can I get satisfactory power from my engine? How can I obtain high mileage per gallon of fuel? How can I reduce the excessive carbon deposits that bother me all of the time?

Doubtless you have asked yourself all of the above questions at some time or other, perhaps you have even sent us a letter containing one or more of them, for we receive many such inquiries every week.

If you want an answer to any of them we advise you to try a sample of Standard Motor-Pep, marketed by the Utilities Co., 310 Citizens Bldg., Cleveland, Ohio. A product that is giving satisfaction.

Standard Motor-Pep is a scientifically prepared compound, in tablet form, that gives gasoline that so-called "pep" which means a snappy and powerful engine only obtainable heretofore with high-test gasoline. It is dissolved in the gasoline and it is said that gasoline so treated gives nearly 15 per cent more mileage.

Every reader should investigate this product, a sample package large enough to treat 100 gallons of gasoline can be had at a very low price.

A Vise for Many Uses.

There is nothing to warrant the belief that the labor shortage will be immediately relieved with the ending of the war. The garage mechanic will continue to be hard pressed for time in getting out work. But in any event, time- and labor-saving tools and repair equipment will always hereafter be considered indispensable toward complete shop efficiency.

Take vises. How often must the shop mechanic handle a piece of work with an ordinary vise that is permanently attached

Fig. 1.

Fig. 2.

to the work bench? The removable and portable vise is now found in most every well-managed repair shop.

The "Yankee" Vise, No. 1993, shown herewith, is not only removable from its base, but it is square finished, on sides, end and bottom.

The work is trued up once and can then

Fig. 3.

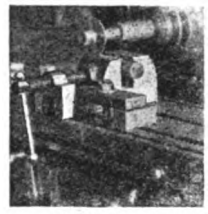


Fig. 4.

be carried through half a dozen operations without removing it from the jaws of the vise. No resetting is necessary.

In the first illustration we see a steel cylinder locked in a "Yankee" Vise, No. 1993, and placed squarely on surface plate for accurate center marking.

The vise is then put back on its swivel base (bolted to bench), where with set screw and cam-throw lever it can be locked securely in any position for center punching, as shown in Fig. 2.

Then vise and all are carried to the drill press, assuring a true-drilled hole every time, as at Fig. 3.

Still gripping the work firmly, the vise is then used on bed of milling machine, as shown in Fig. 4.

During all the operations the work remains in original alignment A separate grooved steel plate; for firmly holding round and irregular pieces in any position, comes with each vise of this model.

Any mechanic will see how this handy tool saves time and assures an accurate job as well. It's the kind of tool that the mechanic enjoys working with; that is sure to make him more valuable to himself and his employer.

And this is only one of the numerous special feature "Yankee" Tools made by North Bros. Mfg. Co., Philadelphia.

At the I. O. M. A. Convention.

It has been said that the most complete display of gasoline and oil hose ever made was in the space, booths 28, 30 and 32, of the Metal Hose & Tubing Company, Brooklyn, N. Y.

All sizes of the special hose, Triplexd, produced by this manufacturer, were shown in a great variety of complete lengths with fittings, and cut sections demonstrating the construction.

A monster loading hose such as the government ordered for tankers had the place of honor in the center and a standard, displaying the filling station hose in all sizes, stood near it.

There was a full display of large size loading and unloading hose, tank car and tank wagon hose, and filling station hose for every requirement.

Among the attractions was a length of Triplexd Gasoline Hose, sold over three years ago and in use by the purchaser for three years, which was in such excellent condition as to warrant the claim that it still was very serviceable.

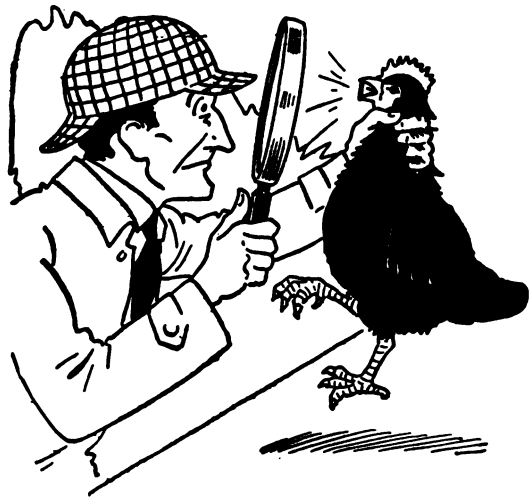
There were demonstrations of the flexibility of the hose, adjustment of the connections, and other details interesting to users of gasoline and oil hose. A sufficient staff of salesmen was in attendance to promptly care for all inquiries.

Among the pump and tank makers who exhibited, five of the six, or 83 per cent. displayed Triplexd Gasoline Hose as standard equipment on their products.

Superior Ignition Parts.

The excellent results that the trade have obtained in the use of Superior ignition repair parts and motor-generator brushes is ample proof that these articles are all that their name implies. In producing Superior parts, etc., the manufacturers make no attempt to compete with the many low-grade parts with which the market is flooded, and which have been turned out with no regard whatsoever as to what the ultimate results would be when such products are used.

They have merely been made to sell at a price. It is no wonder that the Specialty Manufacturing Company has shown such remarkable growth in the past two years, when it is considered that their Superior parts, etc., are in every way equal, and, in some cases, better than the original equipment.



They use no composition or alloy metals in any of their contact points, which are all made of pure platinum or pure tungsten as the case may be.

Motors and generators can also be rendered decidedly inefficient if the proper grade of brushes are not used, and for this reason the company has made extensive laboratory tests and experiments to determine just exactly what grade of stock is best suited for each of the many types of starting motors and lighting generators on the various cars, and for this reason perfect results are assured when Superior brushes are used.

Deliveries, particularly during these strenuous times, are of utmost importance, and this company seems to have solved this problem, as all orders are invariably shipped on the same day as they receive them. This fact is, of course, of great importance to the trade at all times.

The prices of this line of merchandise are exceptionally low, and are fully set forth in the new catalog of the Specialty Manufacturing Company, 641 Massachusetts Avenue, Arlington, Mass.

As scarce as hen's teeth

The shortage of carburetors is becoming more apparent daily. All manufacturers are affected about alike—labor and material both very scarce—war orders getting preference in OUR factory.

Yet the public needs more good carburetors. The dealer who buys Rayfields now is the man who will have them to sell—the man who doesn't buy now can only offer excuses.

First come, first served.
Order now.

Service stations and dealers everywhere.

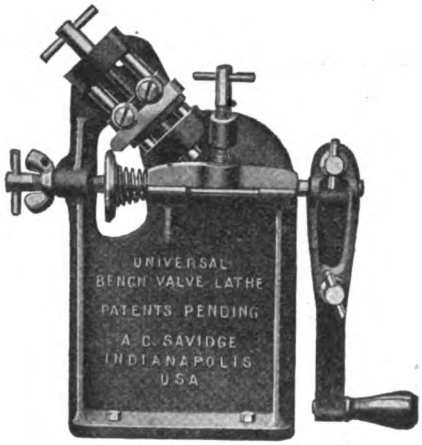
Valve Refacers.



No part of the engine is more essential than the valves. An engine may be in good condition in every way, but if the valves do not fit properly and permit the gas to pass through then the engine itself will not

Savidge Junior Valve Lathe.

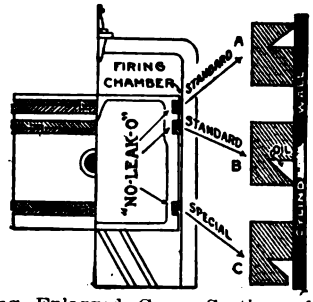
give satisfactory power. As a matter of fact there is great danger in permitting an intaking valve to leak. A back fire might result and the carburetor would explode.

The average owner has the idea that by regrinding his valves they can be brought into condition again, but this is not true. If a valve has been reground a certain number of times its surface is gone. It may be worn oval or it may lose its proper angle. To grind it any further might result in severe damage to the engine block and so the valve should be resurfaced. To do this a lathe is necessary, and A. C. Savidge of Indianapolis, U. S. A., manu-

Savidge Bench Valve Lathe.

factures two valve lathes which may be operated by hand and purchased at an extremely low figure. The first is termed "Junior" and is much lighter than the second one. Both lathes are adjustable in all ways, and it is claimed that a perfect surface upon the valve can be had with a minimum amount of effort.

Automobile Brushes.



Whether the repair man or garage owner is looking for a paint brush or for a special form of washing or dusting brush for the automobile, he should be sure to send for illustrated literature showing the line of brushes put out by John L. Whiting-J. J. Adams Co., Boston, Mass. These brushes are made by a special method which retains the toughness of the bristles yet gives them a softness and elasticity which makes the quality.

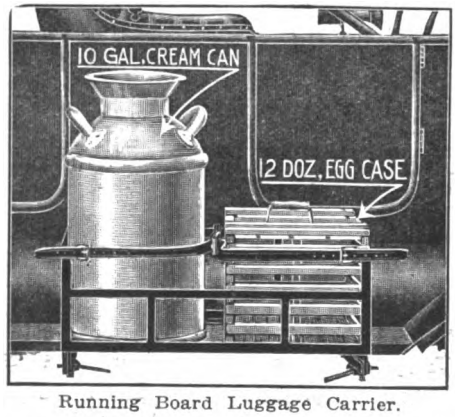
The bristles and hairs are held in a piece of the best quality rubber, and it is claimed that there is absolutely no way in which the bristles can be pulled out. This should be of special interest to the automobile painter or varnisher who knows that a brush that sheds its hair takes more time than the painting.

Then again, one who washes automobiles should be particularly interested in the washing brushes, for the reason that no matter how warm the water there is no danger of the brush shedding its bristles.

A Piston Ring That Don't Leak.

As a solution to the problem of avoiding kerosene precipitation into the crank case with subsequent lubricant dilution, the No-Leak-O Piston Ring Co., 824 W. North Avenue, Baltimore, Md., have a special type of piston ring that they have developed, so installed that the top ring provides a groove with a square edge to catch any kerosene attempting to pass. This is pushed up on the compression stroke. After

Showing Enlarged Cross Section of Piston with No-Leak-O Rings Applied.



the explosion, or when the piston starts down, this refuse is carried out of the groove by capillary action into the firing chamber just after the explosion, when it is the hottest, and the kerosene is then vaporized and exploded, or ejected with the exhaust, and not into the oil pit.

Gas cannot be controlled or held in the firing chamber except by a seal of oil. Oil cannot be held down and adequate lubrication provided, except by a seal, or dam against the oil. These are the principles adopted in this "No-Leak-O" Piston Ring, rather than try to accomplish similar results solely by perfect fit, flexibility, etc.

Readers may write direct to the above company, mentioning this paper, and secure further details of the "No-Leak-O" Piston Ring, which, indeed, seems practical.

Running Board Luggage Carrier.

It is very evident that the farmer of today has begun to realize that his automobile is not only a passenger car but a business vehicle. In rural communities one

Running Board Luggage Carrier.

often sees the automobile being used as an express wagon—the tonneau crowded with provisions or products, the running board loaded with cases, and frequently articles are strapped to the fenders themselves.

H. G. Paro Co. of 1410-14 South Michigan Blvd., Chicago, Ill., are placing a product upon the market which deserves special mention. It is known as the Ekern's Running Board Carrier; a fitting especially designed for farmers in which they can carry cream, eggs or other products to the market without injury to their car. The carrier is 28 inches long, 14 inches wide and 9½ inches deep. It has a space for two ten-gallon cream cans, two egg cases or one egg case and a cream can.

It is fitted with two heavy straps and is designed to clamp firmly upon the running board. It is finished in black enamel and weighs about 18 pounds. Dealers should write for prices, as this seems to be a particularly interesting proposition and offers ready sale.

The Victor Heater.

Now that winter is fast approaching and there is frost and chill in the air, the automobilist who intends to use his car during the fall and winter months, as well as in the early spring, if he cares to be comfortable, should write the Foreign & Domestic Auto Supply Co., 1765 Broadway, New York, for their product—the Victor Heater.

This device is designed to fit into the floor of the car, the only part protruding above the floor being a thin metal casting. The lower part of the heater, which contains baffle plates and passages

The Victor Heater.

for absorbing the heat, extends below the floor. To this part is connected the exhaust pipe from the engine and at the other end is connected the muffler pipe.

The hot exhaust from the engine heats the various surfaces of the heater, and a warm current of fresh air is carried up through the heater itself. None of the exhaust gases escape into the car, so that the device can be used very successfully in closed cars of all types.

Not only does the device serve to warm the car, but it also acts as a ventilator, furnishing a steady current of warm fresh air through it. The price is exceptionally low and within the reach of every automobilist. Our readers are invited to write for further details to the address given above.

McCormick-Allmand Weatherstrip.

Aside from the fact that moisture, snow, or fog collects upon the outside surface of the windshield, much of the trouble is caused by the water leaking in between the two parts of the glass at the joint, and running down the inside of the shield. Every automobilist who owns a divided windshield should investigate the McCormick-Allmand Weatherstrip marketed by the Robinson Manufacturing Co., 503 Lincoln Bldg., Louisville, Ky.

This Weatherstrip is made of the best quality rubber and designed for practically any thickness of windshield glass. In writing for prices be sure to state the thickness of the glass, and the type of windshield. Special dealers' proposition is made by the concern.

CORK INSERT

A big success

—because it has made good on hundreds of thousands of Fords

Why has Cork Insert made good in such a big way? What makes it work so smoothly? Simply this: The cork buttons provide *improved* friction. The powerful high-grade fabric carries the load.

It isn't the cork—It isn't the fabric It's the COMBINATION

in the patented Cork Insert way—that has made Cork Insert the big success that it is.

Cork alone hasn't the strength for transmission lining usage. Fabric alone lacks frictional qualities. It glazes down too quickly, causing grabbing, slipping, chattering.

But Cork Insert has the ideal combination of STRENGTH PLUS FRICTION. When you apply the brake, the corks come into contact with the brake drum first. They compress gradually and ease the load down to the fabric. The light pressure required, and velvety smooth action of the buttons of cork coming in contact with the drums, mean such long wear that Cork Inserts are far the cheapest in the long run.

Be sure you buy Cork Insert

Remember the name and see that you get it. It is sold in a red and black box with the name "Cork Insert" in big letters.

Cylinder Repairing or Grinding.

We are continually receiving letters from our readers asking the reason why their engines do not develop as much power as they did when they were new, and asking why they cannot seem to fix them so that they give satisfaction. Then again we receive letters asking why there is excessive amount of carbon deposited in the cylinders, and to all of these we suggest that they see whether or not the cylinders are in condition. With the present day fuel, cylinders wear very fast; they are apt to score or scratch or wear out of round.

Even a few thousands of an inch wear is sufficient to reduce the power and cause excessive carbonization. When this happens cylinders should be reground or rebored. In case of scores the groove should be refilled or rewelded. To any of our readers who are troubled with any of these annoyances we would suggest that they write the Bridgeport Piston Ring Co., Third Street at Connecticut Avenue, Bridgeport, Conn., who make a specialty of regrinding cylinders of silver soldering scores, and refitting pistons and rings. These people are specialists in this line of work and have had extensive experience.

The Regular December, 1918, Issue
—of the—
Automobile Dealer and Repairer
WILL BE A
Tool and Machinery Number

This issue will be largely devoted to practical advice and instruction for Repairmen and Garagemen on Tool and Machinery Shop Equipment. It will be the first number of the kind we ever brought out and

Instruction

AUTOMOBILE INSTRUCTION—The West Side Y. M. C. A. Automobile School gives a practical course in shop and road practice in four or eight weeks, day or evening. Provision made for out of town men. 322 West 57th St., New York City.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912, OF AUTOMOBILE DEALER AND REPAIRER, published monthly at New York, N. Y., for October 1st, 1918.

STATE of New York } ss.
COUNTY of New York }

Before me, a notary public in and for the State and county aforesaid, personally appeared Frank R. Whitten, who having been duly sworn according to law, deposes and says that he is the business manager of the Automobile Dealer and Repairer, and that the following is to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

NAME OF—

Publishers—Motor Vehicle Publishing Co., 71-73 Murray St., New York City, N. Y.

Editor—M. T. Richardson, 71 Murray St., New York City, N. Y.

Managing Editor—M. T. Richardson, 71 Murray St., New York City, N. Y.

Business Managers—F. R. Whitten, 41 Pinehurst Ave., New York City, N. Y. M. T. Richardson, 71 Murray St., New York City, N. Y.

2. That the owners are:

Motor Vehicle Publishing Company, 71-73 Murray St., New York City, N. Y.

STOCKHOLDERS—M. T. Richardson, 71 Murray St., New York City, N. Y.

F. R. Whitten, 41 Pinehurst Ave., New York City, N. Y.

A. J. Richardson, Ridgewood, N. J.

Cornelius Doremus, 66 Broadway, New York City, N. Y.

Mrs. J. Howard Girardeau, Jr., Monticello, Fla.

Mrs. Guy Ulmer, New Rochelle, N. Y.

Mrs. Harriet L. Johnston, New Rochelle, N. Y.

3. That the known bondholders, mortgagees and other security holders owning or holding 1 per cent. or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also in cases where the stockholder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear on the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds or other securities than as so stated by him.

MOTOR VEHICLE PUBLISHING CO.,
Publishers,
Automobile Dealer and Repairer.
F. R. WHITTEN, Business Manager.

Sworn to and subscribed before me this 26th day of September, 1918.

ROBERT F. W. SCHMIDT,
Notary Public.

(My commission expires March 30, 1919.)

Cylinders Reground

ATTENTION

Those Requiring the Very Best in

CYLINDER GRINDING

fitting with light grey iron pistons, leakless rings, hardened and ground pins, our work has no comparison with the ordinary, now obsolete heavy type pistons and rough boring jobs. We grind our cylinders to one-half thousandths, mirror finish. We grind our pistons on the highest grade machines to fit, two and one-half thousandths clearance. We use the McCadden leakless piston rings. Work all reassembled ready for installation. All work positively guaranteed.

Patterns and castings in stock for every make of motor.

The Lauton Plan.

Few dealers have realized the large profits to be had in selling conversion units and truck bodies, and still fewer dealers have realized that there is a big market for trucks which cannot be obtained at the present time. The answer to the latter problem is, buy an old car, convert it into a truck by means of conversion units and sell it as a truck.

This idea is fully explained in a little booklet put out by the Lauton Truck Co., 404 Sycamore St., Youngstown, Ohio, and entitled "The New Way to Sell Truck Units." The bright dealer who adopts this plan is assured of much larger profits, for instead of selling only a part of the truck at a part of the profit, he sells a whole truck at a large profit. Every reader should write for this booklet, which is sent free.

A HANDY LITTLE CHRISTMAS GIFT

SCHRADER UNIVERSAL Tire Pressure Gauge

Fulfils every condition of appropriateness and suitability as a present to a Motorist.

Not just useful and ornamental, but positively indispensable. Will gain you the thanks of the recipient not only at the time of the giving, but for months afterwards, because every time it is used it adds days and miles to the life of his tires.

Fits in the vest-pocket.

Price in U. S., $1.50, packed in soft leather case.

At Your Dealer's, or

A. SCHRADER'S SON

783-803 Atlantic Avenue BROOKLYN

THIS PATENTED INVENTION PRODUCES PROFIT TO YOU

AS A TIME SAVER IN BOOSTING CUSTOMERS THROUGH MORE BUSINESS AND MORE MONEY

Don't take off the Crank Case to weld a broken arm—it costs too much—altogether about $25.00. Use this arm next time she breaks. Jack up the motor, bolt on the arm and in 15 minutes the job's done.

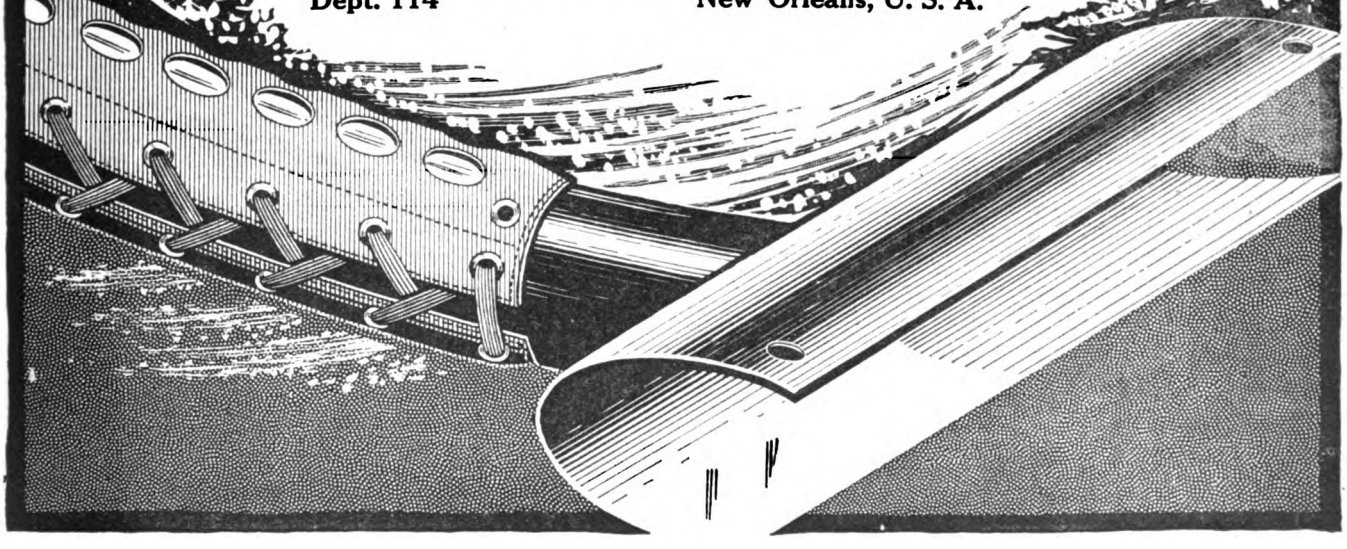
The Secret of Steer Warms —The Brass Plate

The reason why Steer Warms make good, and will continue to make good for years, is based on the brass plate. The body of Steer Warms is composed of a heavy brass plate which does two things—first, it protects the resistance wire, and second, it acts as a conductor to hold and distribute the heat over the whole surface of the Steer Warms. The leather on top of the brass plate holds the heat in, but lets it out through the holes that are covered by the hand when holding the wheel. In this way, the greatest amount of heat radiation is obtained with the least amount of heating surface and the least use of electric current.

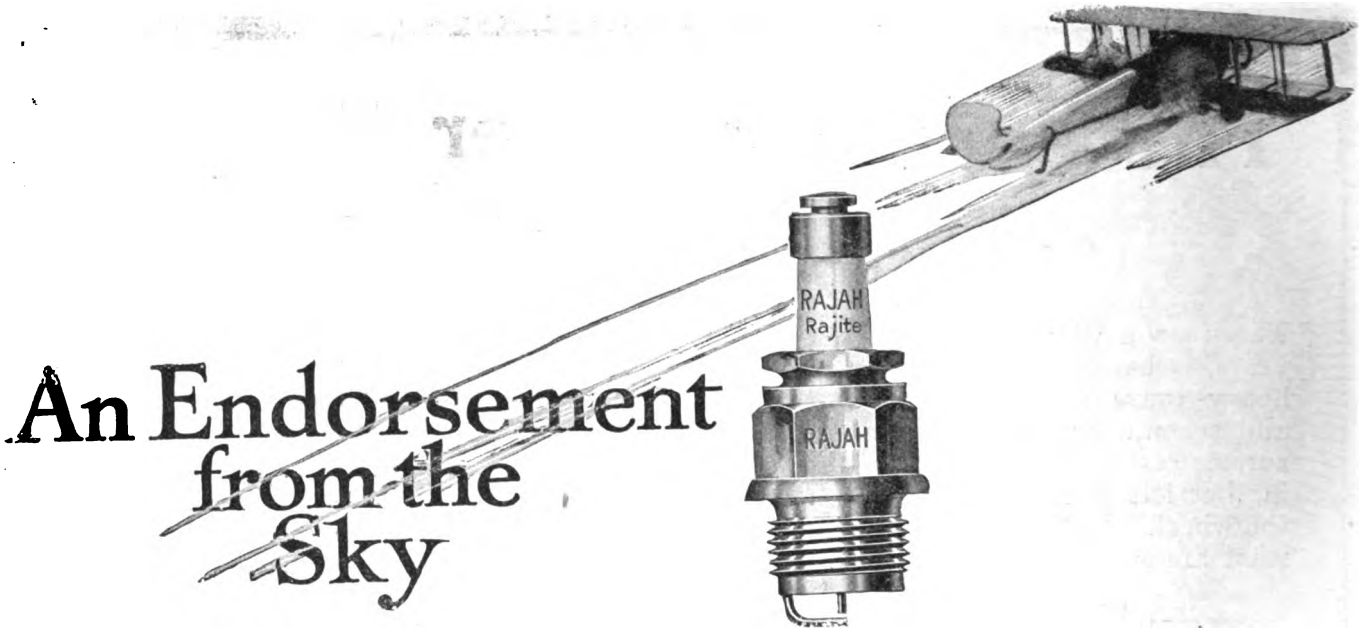
SteerWarms

Can Be Guaranteed to Your Customers



Because Steer Warms are so securely made they will not wear out. Many of them have been in use for years and they are still as good as ever. We guarantee them for five years against burn-out, but they will last much longer. Remember that in using Steer Warms there is absolutely no chance of a shock. They will not injure the other electrical connections; there is no chance of grounding; they won't injure the battery and they are very easy to install. Send in your stock order today to your jobber.

Special Offer



Write for our special offer to dealers who will push Steer Warms this year. We supply liberal advertising materials. Ask how you can make money on Steer Warms. Write today.

A SURE SIGN of carbon is a smoky exhaust, due to lubrication getting *past* the piston rings up into the combustion chambers where it *burns*. Leaky piston rings waste as high as 25% gasoline —one drop in four.

HI-COMP PISTON RING

"THE RING THAT MAKES THE MOTOR SING"

are the best gas-tight rings for overcoming engine troubles due to carbon—knocking, skipping, faulty ignition; valve pitting, wearing down of cylinder walls, piston and piston rings; smoky exhausts.

Hi-Comp Piston Rings are made from two perfectly balanced perfect eccentric rings into one absolutely gas-tight concentric ring. Each ring ground under oil — not buffetted — to preserve the true temper of the secret process gray iron and ensure high polish and gas-tight fit. Won't wear cylinders out of round — *proof* of gas-tightness. Make reboring of average cylinders unnecessary — an exclusive Hi-Comp advantage. Hi-Comp Piston Rings deliver every ounce of power from every drop of gasoline on to the piston head— no power or oil can get past them!

It will pay you to install Hi-Comp because of the satisfaction they give to you and your customers. Fully guaranteed by an old established piston ring company to give MORE POWER on less gasoline and oil. Write for booklet, specification chart and details of 90-day trial guarantee

Insures Easy-Starting In Winter

And Saves From 30 to 50 Per Cent of Your Gasoline

THE sharp days and cool nights of Autumn emphasize right now the need for easy starting.

There's no job meaner than cranking away at a motor that's been chilled by standing idle in cold weather. Even in October many cars—particularly Fords—refuse to come to life without priming.

Install a Sunderman—and Forget Starting Troubles

The Sunderman is an easy-starting carburetor in all weathers, in all climates and in all altitudes. Our tests have proved to us that it is the easiest-starting carburetor of any of the great variety that have come under the notice of our service-station experts.

No matter how chilled the motor—short of a frozen radiator—all you have to do is pull on the "choker" and crank as you would in July. Those instructions are the same whether you have a self-starter or you start it yourself by muscle-power.

Its Quick Starting Feature Alone Will Sell the Sunderman

If you will demonstrate this feature, Mr. Dealer, you will multiply your Sunderman sales many times over this winter. Nothing else that you can sell a car owner can make the same appeal or add so much to his comfort and convenience as a carburetor that will start his car in cold weather, *quickly*. The Sunderman Carburetor does *that*—all that is necessary is to follow the simple instructions that accompany every carburetor we sell.

And It Saves Your Gasoline at the Same Time

The reason for the quicker starting of our carburetor is the same as that for the increased power it gives—a *finer* vaporization—a better, more quickly and powerfully explosive admixture of gasoline and air.

The Sunderman mixture is a triumph in the science of carburetion—because it gives more power while it saves. The saving is automatic. Every bit of gasoline is broken up more finely and gives more power. This break-up and the greater power that follows result in a saving in gasoline that we positively state is from 30 to 50 per cent. It is more on some cars.

Car Owners—Send us an order at once. State the make and model of your car and we will give you instant service.
